FLIGHT CREW OPERATING MANUAL

REFERENCE: ARG A330 FLEET FCOM

ISSUE DATE: 21 FEB 24

Intentionally left blank

AEROLINEAS ARGENTINAS **A330** FLIGHT CREW OPERATING MANUAL	**TRANSMITTAL LETTER**

Issue date: 21 FEB 24

This is the FLIGHT CREW OPERATING MANUAL at issue date 21 FEB 24 for the A330 and replacing last issue dated 28 NOV 23

Intentionally left blank

AIRCRAFT ALLOCATION TABLE

This table gives, for each delivered aircraft, the cross reference between:

- The Manufacturing Serial Number (MSN).
- The Fleet Serial Number (FSN) of the aircraft as known by AIRBUS S.A.S.
- The registration number of the aircraft as known by AIRBUS S.A.S.
- The aircraft model.

M(1)	MSN	FSN	Registration Number	Model
	0587		LV-GKO	330-203
	0634		LV-GKP	330-203
	0877		LV-KAN	330-202
	0899		LV-KAO	330-202
	1191		LV-KHT	330-243
	1223		LV-KHU	330-243
	1605		LV-FVH	330-202
	1623		LV-FVI	330-202
	1737		LV-GHQ	330-202
	1748		LV-GIF	330-202

IF INSTALLED TABLE

Ident.: GEN-IFIT-00016907.0001001 / 23 JUN 15
Applicable to: ALL

The "If Installed Table" provides a list of optional systems and functions of the aircraft.
For most of the optional systems or functions associated with the "if installed" ◁ symbol in the FCOM, the table indicates if the optional systems or functions are installed, or not installed.

Note: *Highly customized options such as cabin installations are not covered in the following table.*

MAIN FCOM CHANGES

Ident.: GEN-00013886.0001001 / 03 AUG 17
Applicable to: ALL

The purpose of the Main FCOM Changes is to provide Operators with general information about the most significant changes that are introduced in the current revision of the manual.
The main FCOM changes are available on the Airbus World portal, under the path: Content Library / Flight Operations / Manuals / Main FCOM - FCTM - MMEL Changes.

In addition, every revised Documentary Unit (DU) has a revision highlight (HL) that:
- Indicates the change(s) made to the DU
- Can be found in the associated “Preliminary Pages – Summary of Highlights” subchapter.

In addition to the Main FCOM Changes, the Modification Operational Impact (MOI) documents available on the Airbus World portal provide the operational impact linked to a MOD number.

FCOM PURPOSE

Ident.: GEN-00012540.0001001 / 18 NOV 21
Applicable to: ALL

FCOM PURPOSE

The Flight Crew Operating Manual is a support document for flight crew.

The purpose of the FCOM is to:
- Provide all necessary operating limitations, procedures, performance and system information the flight crew needs to safely and efficiently operate A330/A340 aircraft during normal, abnormal, and emergency situations
- Serve directly as Flight Crew Operating Manual, or as a basis for Operators to develop their own customized Airline Operations Manual, in accordance with applicable requirements
- Serve as a comprehensive reference guide during initial and refresher flight crew training.

Note: *This manual is not designed:*

- *To teach basic piloting skills*
- *To provide basic piloting techniques applicable to jet aircraft, or information, that are considered as basic airmanship for trained flight crews who are familiar with that type of aircraft and its general handling characteristics.*

The FCOM complements the Airplane Flight Manual.
If the FCOM data differs from the AFM data, the AFM remains the reference.
As a supplement to the FCOM, the FCTM may provide additional information that the flight crew should read in conjunction with the FCOM. For more information, *Refer to FCTM/GI FCTM Purpose*.
For any questions or comments related to this manual, the Operator's Flight Operations Management can contact the Airbus Flight Operations Support & Training Standards department.

FCOM CONTENTS

The FCOM has four sections:

- Aircraft Systems : This section is divided into ATA chapters for each aircraft system. This section includes a specific description of each system and its associated cockpit interfaces. When several layouts are possible for the same cockpit interfaces (e.g. when the position of the ON/OFF label of a switch changes depending on the aircraft configuration), the FCOM may describe only one typical layout.
- Procedures : This section contains the following chapters:
  - Abnormal and Emergency Procedures
  - Normal Procedures that include the SOP, the SUP, and the SRP
  - Special Operations.
- Limitations : This section provides the aircraft and system limitations that the flight crew must know or refer to in operations.
- Performance : This section includes the performance computation description for each flight phase.

DOCUMENTARY UNITS

The FCOM is made of Documentary Units. The DU is the smallest part of information with a technical content.
The DUs are listed on a separate "List of Effective Documentary Units" (LEDU). *Refer to GEN List of Effective Documentary Units (LEDU) - Paper Only*.

Note: *1. DUs can be grouped into Group of DU (GDU)*
2. Temporary information may be provided via Temporary DU (TDU).

IDENTIFICATION STRIP

Below the title of the DU, the identification strip provides:
- The list of MSN the DU is applicable to
- For TDU, the reference to the DU impacted by the TDU.

LIST OF EFFECTIVE SECTIONS/SUBSECTIONS (LESS) - PAPER ONLY

Ident.: GEN-00013869.0001001 / 24 MAR 11
Applicable to: ALL

The List of Effective Sections/Subsections (LESS) summarizes all the sections and subsections contained in the FCOM. For each revision, a new LESS is issued when at least one DU of the section/subsection is changed.

The LESS consists of:
- The "M" field that may provide the following evolution code:
  - The "N" letter indicates a new section introduced by the revision
  - The "R" letter indicates a section in which the content has been revised
  - The "E" letter indicates an aircraft validity change within the section
  - The "M” letter indicates a section that have move within the FCOM
- The “Localization” field that allows localizing the section within the manual with the product structure
- The “Subsection title” field
- The “Rev. Date” field that indicated the date at which the section was changed.

LIST OF EFFECTIVE DOCUMENTARY UNITS (LEDU) - PAPER ONLY

Ident.: GEN-00013872.0001001 / 24 MAR 11
Applicable to: ALL

For each revision, a new List of Effective Documentary Units (LEDU) is issued at the section level. The LEDU provides information about the DU localization, applicability, identification and issue date.

The LEDU consists of:

- The "M" field that may provide the following Evolution Code:
  - The "N" letter indicates a new DU introduced by the revision
  - The "R" letter indicates a revised DU: The content of the DU is updated by the revision. A vertical line in the margin of the DU locates the modified part
  - The "E" letter indicates an aircraft validity change for the DU: The list of MSNs for which the DU is effective has been changed compared to the previous LEDU, by addition or deletion of one or several MSN
- The “Localization” field that allows localizing the DU in the manual with the product structure of the manual
- The "T" field (Temporary Information) that contains a cross if the associated DU is a TDU
- The "DU title" that provides the title of the DU
- The “DU identification” that identifies the DU with its identification number or the GDU with its code.
- The “DU date” that indicates when the DU has been released
- The DU criteria which lists the technical or operational criteria for which the DU and solution is applicable to.
- The “Applicable to” which provides the list of aircraft this DU and solution is applicable to
- The "Impacted by TDU" which is the identification of the TDU superseding the DU

LIST OF EFFECTIVE TEMPORARY DOCUMENTARY UNITS (LETDU) - PAPER ONLY

Ident.: GEN-00013887.0001001 / 29 MAR 11
Applicable to: ALL

The List of Effective Temporary Documentary Units (LETDU) provides a summary of the Temporary DU impacting the section.

The LETDU consists of:

- The "M" field that may provide the following Evolution Code:
  - The "N" letter indicates a new TDU introduced by the revision
  - The "R" letter indicates a revised TDU: The content of the TDU is updated by the revision. A vertical line in the margin of the TDU locates the modified part
  - The "E" letter indicates an aircraft validity change for the TDU: The list of MSNs the TDU is applicable to has been changed compared to the previous LETDU, by addition or deletion of one or several MSN
- The “Localization” field that allows localizing the TDU in the manual with the product structure of the manual
- The “TDU Title” that provides the title of the TDU

- The “TDU identification” that identifies the TDU with its identification number with its own unique code
- The “TDU date” that indicates when the TDU has been released
- The TDU criteria which lists the technical or operational criteria, the it is applicable to
- The “Applicable to” which provides the list of aircraft this TDU is applicable to
- The “Impacted DU” which is the Identification of DU superseded by the TDU
- The “Reason for issue” of the TDU

Note: *1. TDU is displayed on a yellow background.*
2. Within the QRH the TDU replaces the impacted DU.

AIRCRAFT ALLOCATION TABLE (AAT) - PAPER ONLY

Ident.: GEN-00013888.0001001 / 24 MAR 11
Applicable to: ALL

The Aircraft Allocation Table (AAT) provides a view of the fleet covered in the FCOM. For each aircraft, the AAT provides its MSN, its registration number and the model.

LIST OF MODIFICATIONS (LOM) - PAPER ONLY

Ident.: GEN-00013889.0001001 / 25 MAR 11
Applicable to: ALL

The List of Modifications (LOM) lists the criteria (Modification Proposal (MP) or Service Bulletins (SB)) which the installation on the aircraft affects the FCOM.

Note: *Each MP has one or more associated MODs. The MP/MOD correlation is available in AirN@v / Engineering.*

The LOM also indicates:
- The title of the criteria
- The date of incorporation of the criteria in the FCOM
- The list of aircraft that have the criteria
- The "M" field that may indicate the following evolution code:
  - The "E" letter indicates an aircraft validity change of the criteria. The list of aircraft to which the criteria applies has changed compared to the previous FCOM revision, by addition or deletion of one or several aircraft.
  - The "N" letter indicates new criteria added by this FCOM revision
  - The "R" letter indicates a change in the criteria title or associated SB.

FCOM USE AND ORGANIZATION

Ident.: GEN-00012542.0001001 / 21 MAR 16
Applicable to: ALL

DEFINITIONS OF WARNINGS, CAUTIONS AND NOTES

The following are the official definitions of warnings, cautions and notes taken directly from the JAR25/CS-25 and applicable to Airbus flight operation documentation:

WARNING	An operating procedure, technique, etc. that may result in personal injury or loss of life if not followed.
CAUTION	An operating procedure, technique, etc. that may result in damage to equipment if not followed..
NOTE	An operating procedure, technique, etc. considered essential to emphasize. Information contained in notes may also be safety related.

INFORMATION TYPE AND LAYERS

The FCOM has technical information that may be used for:

- Flight crew operations in flight, or on ground
- Airlines operations on ground
- Training.

To take the above-noted objectives into account, the FCOM is organized in three layers as follows:

- Layer 1: "Need to know"
  Layer 1 presents information that is necessary in the cockpit.
- Layer 2: "Nice to know"
  Layer 2 presents information that is used as a reference, in order to fully understand the logic of the aircraft and pilot interfaces.
- Layer 3: Detailed information
  Layer 3 provides more detailed explanations, that are not necessarily needed in flight.

Note: For paper only, the following examples show the visual characteristics of each kind of layer

EXAMPLE	- Text in layer 1 Layer 1 is the default layer. No symbology when not following layer 2 or layer 3 information.

L2

EXAMPLE	- Text in layer 2

L3

EXAMPLE	- Text in layer 3

L1

EXAMPLE	- Text in layer 1 (as this text follows a text in layer 2 or 3, symbology "L1")

OPTIONAL EQUIPMENT

The legend ◁✻ (if installed) indicates that a paragraph or an illustration is applicable only if the related optional equipment is installed.

FCOM FORMAT AND STYLE INFORMATION - PAPER ONLY

Ident.: GEN-00013880.0001001 / 09 NOV 20

TABLE OF CONTENTS

Each TOC entry has an alphabetical index that identifies this TOC entry within its subsection. The manual user can easily find a TOC entry content within the manual thanks to this alphabetical index and the subsection identification. Both are indicated in the TOC and both cross-refer to the paper page footer (see the TOC indexing part below).

REVISION MARK

In the paper format, a vertical bar in the margin of the DU identifies the modified part. Each vertical bar has a numerical index that refers to the associated reason of the change in the Summary of Highlight.
This Summary of Highlight lists all the changes and associated reasons of the change (if necessary) that the revision has introduced.

TOC INDEXING

In the paper page footer, the TOC indexing is of the following type:

A	:	The paper page contains the whole "A" TOC entry content
A to B	:	The paper page contains the whole "A" and "B" TOC entries contents
A →	:	The "A" TOC entry content starts on this paper page and continues on the following paper page
← A	:	The "A" TOC entry content starts on a previous paper page and finishes on this paper page
← A →	:	The "A" TOC entry content starts on a previous paper page and continues on the following paper page
A to C→	:	The paper page contains the whole "A" and "B" TOC entries contents but the "C" TOC entry content starts on this paper page and continues on the following paper page
← A to C	:	The paper page contains the whole "B" and "C" TOC entries contents but the "A" TOC entry content starts on a previous paper page and finishes on this paper page
← A to C →	:	The paper page contains the whole "B" TOC entry content but the "A" TOC entry content starts on a previous paper page and finishes on this paper page and the "C" TOC entry content starts on this paper page and continues on the following paper page

Note: 1. *The indexes follow the alphabetical order: A, B, C, ..., Z, AA, AB, AC, ..., AZ, BA, BB, BC, ...*
2. *For each subsection, the index starts again from A.*
3. *When a TOC entry content continues on the following paper page, the text "Continued on the following page" is also indicated.*

FCOM REVISIONS

Ident.: GEN-00012546.0001001 / 09 NOV 20
Applicable to: ALL

FCOM REVISION

FCOM revisions are issued to add, update, or revise information. The Operator determines the revision periodicity.
When necessary, a revision may be issued in between the defined periodicity (e.g. need for urgent update).
A vertical bar appears to the left of all revised parts of the manual.

TEMPORARY INFORMATION

Some FCOM sections may need a temporary update (e.g. to explain a system behavior that will be modified by a future standard). In such cases, the applicable FCOM section is updated with a TDU.
Information contained in the TDU is highlighted in the manual and the initial content of the FCOM remains available for consultation and comparison and is highlighted (identification strip) as being impacted by the TDU.
A LEDU is provided in the FCOM.

OEB GENERAL DESCRIPTION

Applicable to: ALL

Ident.: GEN-A-00022618.0001001 / 09 NOV 20

DEFINITION

An Operations Engineering Bulletin is published to inform Operators of any deviations from initial design objectives that have a significant operational impact. An OEB provides the Operators with technical information and temporary operational procedures that take into account these deviations.

An OEB:
- Is temporary and usually focuses on one operational subject only
- Is included in the OEB section of the QRH so that the flight crew can easily access it
- At any time during the flight, if the OEB conditions are applicable, the flight crew must apply the operational procedure(s) that is in the QRH OEB section.

Ident.: GEN-A-00022619.0001001 / 09 NOV 20

TYPE OF OEB

OEBs can either be red or white, depending on their level of priority:
- RED OEBs are published to indicate that non-compliance with the recommended procedures may have a significant impact on the safe operation of the aircraft. The Operators shall provide all flight crews with these OEBs or their content without delay.
- WHITE OEBs are published to indicate that non-compliance with the recommended procedures may have a significant impact on aircraft operation. Airbus recommends that the Operators apply these OEBs within 30 days from the date of publication of these OEBs.

The information in OEBs is recommended by Airbus. If the OEB has an impact on the airworthiness of the aircraft, Airbus also issues a Temporary Revision of the Airplane Flight Manual. If the procedures contained in the red OEB differ from the procedures in the AFM TR, the approved AFM TR remains the reference.
Airbus recommends that all operators rapidly incorporate the corrective Service Bulletins that cancel the OEB when they become available.

Ident.: GEN-A-00022621.0001001 / 09 NOV 20

OEB CONTENT AND MANAGEMENT

OEB IN THE QRH

Each OEB includes all of the following items:
- The title of the OEB PROC
- The “ECAM ENTRY” field:
  This section identifies if one of the possible conditions to apply the OEB PROC is an ECAM warning/caution.
  The flight crew must disregard the ECAM procedure and/or STATUS of the ECAM alerts listed in the "ECAM ENTRY" field and must apply the QRH’s OEB procedure instead.
- The OEB operational procedure(s) that the flight crew must apply
- The technical explanation of the deviation from the initial design objectives.

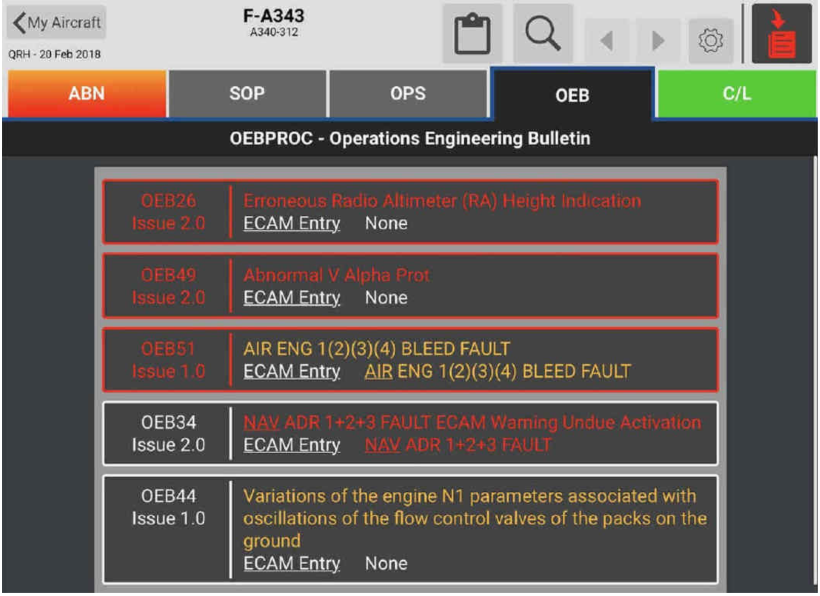
OEB IMMEDIATE ACTIONS

OEB Immediate Actions are actions that the flight crew must memorize, in order to be able to rapidly apply them, without referring the OEB.

OEB Immediate Actions are surrounded by a box in the OEB procedure, in order to enable the flight crew to easily identify them and are preceded by the phrase ‘IMMEDIATELY APPLY’.

QRH LIST OF EFFECTIVE OEBS

The LEOEB enables the flight crew to identify all the OEBs that are applicable to one specific aircraft.



OEBPROC - Operations Engineering Bulletin

OEB26 Issue 2.0	Erroneous Radio Altimeter (RA) Height Indication ECAM Entry None
OEB49 Issue 2.0	Abnormal V Alpha Prot ECAM Entry None
OEB51 Issue 1.0	AIR ENG 1(2)(3)(4) BLEED FAULT ECAM Entry AIR ENG 1(2)(3)(4) BLEED FAULT
OEB34 Issue 2.0	NAV ADR 1+2+3 FAULT ECAM Warning Undue Activation ECAM Entry NAV ADR 1+2+3 FAULT
OEB44 Issue 1.0	Variations of the engine N1 parameters associated with oscillations of the flow control valves of the packs on the ground ECAM Entry None

The QRH LEOEB includes:

- The "identification" field that identifies the OEB number and its issue number. The identification number and title of red OEBs are in red font in the eQRH. The identification number and title of white OEBs are in white font in the eQRH. This identification field enables the flight crew to easily identify the applicable OEBs before flights.

  Note: *OEBs are listed in numerical order and red OEBs are displayed before white OEBs.*

- The "Title" field provides the OEB title and the "ECAM Entry" part of the OEB PROC. This enables the flight crew to easily identify the ECAM procedure that is affected by the OEB.

CAUTION	When Airbus provides the Operator with the LEOEB, the information “ECAM Entry ” does not necessarily mean that (for Operators that use the OEB REMINDER function) the Operator’s maintenance personnel activated the OEB REMINDER codes for this OEB onboard the aircraft. It is the Operator’s responsibility to define a suitable process to provide the flight crew with confirmation that the OEB REMINDER codes are activated for the ECAM alerts affected by OEBs.

TDU GENERAL DESCRIPTION

Ident.: GEN-00023996.0001001 / 29 NOV 19
Applicable to: ALL

A TDU in the FCOM informs the flight crew about a temporary change in a normal Standard Operation Procedure, Advisory or Limitations. The TDU contains the reason for change in order to better understand and memorize this temporary change.

The TDU contains several indications:
- The date of application of the new or revised content
- The reason for change explains why the section is updated with a short general description of the malfunction
- The yellow dash line indicates the affected documentary unit
- When applicable, the arrow link provides a link to the previous content.

TAB GENERAL DESCRIPTION

Ident.: GEN-00023997.0001001 / 29 NOV 19
Applicable to: ALL

A TAB is a description of a system behavior that temporarily deviates from the intended system design and that the flight crew can notice.
The TAB enables the flight crew to better recognize, understand and if applicable, react to the abnormal system behavior in order to avoid any undue operational delay.
When applicable, temporary abnormal behaviors are described in the related section of the Aircraft System in a dedicated product folder identified as "Temporary Abnormal Behaviors".
Each TAB contains a description of the malfunction with an alternative instruction called "Operational recommendation" (if applicable).

GENERAL

Ident.: DSC-20-10-00000707.0002001 / 16 MAR 11
Applicable to: ALL

The A330 is a subsonic, medium to long range, civil transport aircraft.

ENGINES

Ident.: DSC-20-10-00000710.0002001 / 16 MAR 11
Applicable to: ALL

The aircraft has two high bypass turbofan engines, mounted under the wings.

COCKPIT

Ident.: DSC-20-10-00000711.0001001 / 16 MAR 11
Applicable to: ALL

The cockpit is arranged for a two-member crew, and also has a place for two observers.

CABIN

Ident.: DSC-20-10-00000716.0009001 / 05 FEB 15
Applicable to: ALL

The layout for cabin occupants seating may be varied to suit operating requirements.

CARGO

Ident.: DSC-20-10-00000715.0001001 / 21 MAR 16
Applicable to: ALL

Three cargo compartments are under the cabin floor.

Intentionally left blank

GENERAL ARRANGEMENT

Ident.: DSC-20-20-00000717.0001001 / 21 MAR 16
Applicable to: ALL

This subchapter gives the principal dimensions of the aircraft, the location of unpressurized areas, antennas, ground service connections and the ground maneuvering characteristics.

180 DEGREES TURN ON RUNWAY

Ident.: DSC-20-30-00021547.0004001 / 17 MAY 21

3 **Applicable to: LV-KAN**

With the recommended 180 ° turn technique, on dry runway, with the maximum nosewheel steering of 72 °, the approximate turn width is:

- For the A330-200, 41 m (133 ft) without margin
- For the A330-300, 48 m (156 ft) without margin.

Note: *The flight crew should consider additional margin when the runway is wet or contaminated.*

For more info on the recommended 180 ° turn technique, *Refer to FCTM/PR-NP-SOP-100 180 degrees Turn on Runway*.

4 **Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAO, LV-KHT, LV-KHU**

With the recommended 180 ° turn technique, on dry runway, with the maximum nosewheel steering of 65 °, the approximate turn width is:

- For the A330-200, 43 m (142 ft) without margin
- For the A330-300, 53 m (174 ft) without margin.

Note: *The flight crew should consider additional margin when the runway is wet or contaminated.*

For more info on the recommended 180 ° turn technique, *Refer to FCTM/PR-NP-SOP-100 180 degrees Turn on Runway*.

GENERAL

Ident.: DSC-21-10-10-00018213.0008001 / 21 MAR 16
Applicable to: ALL

The air conditioning system is fully automatic.
It provides continuous air renewal and maintains a constant selected temperature in the cockpit and cabin zones, which are independently controlled.

Air is supplied by the pneumatic system, via :
- Two pack flow control valves,
- Two packs,
- The mixing unit, which mixes air coming from both the cabin and the packs.

It is then distributed to the cockpit and the cabin.
Temperature regulation is optimized via two hot air pressure regulating valves and the trim air valves, that add hot air tapped upstream of the packs to the mixing unit air, via the two hot air manifolds.
In an emergency, a ram air inlet can provide ambient air to the mixing unit.
Temperature regulation is controlled by a zone controller and two pack controllers. Flight deck and cabin temperature can be selected from the AIR panel in the cockpit.
Electrical heating of side window blow air ⪡ provides individual heating of the cockpit's left or right-hand side.
A control panel is provided on the Forward Attendant Panel (FAP). During cruise, the cabin crew can modify each cabin zone temperature from the control panel, with a limited authority of ± 3 °C (5.4 °F).
Low pressure air is supplied to the mixing unit via a ground connection.

AIR CONDITIONING PACK

Ident.: DSC-21-10-20-00000775.0001001 / 21 MAR 16
Applicable to: LV-GKO, LV-GKP

The two packs operate automatically and independently of each other. Pack operation is controlled by the pack controller.
Warm pre-conditioned bleed air enters the cooling path via the pack flow control valve and is ducted to the primary heat exchanger.
Then, the cooled bleed air enters the compressor section of the aircycle machine and is compressed to a higher pressure and temperature.
It is again cooled in the main heat exchanger, and enters the turbine section where it expands. In expanding, it generates power to drive the compressor and cooling air fan.
The removal of energy during this process reduces the air temperature, resulting in a very low air temperature at turbine discharge.
The temperature control valve can modify the pack outlet temperature by adding uncooled air to the turbine outlet flow.
In case of an air cycle machine failure, a by pass valve allows the bleed air to be cooled by the corresponding heat exchanger only.

AIR CONDITIONING PACK

Ident.: DSC-21-10-20-00000775.0002001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The two packs operate automatically and independently of each other. Pack operation is controlled by the pack controller.
Warm pre-conditioned bleed air enters the cooling path via the pack flow control valve and is ducted to the primary heat exchanger.
Then, the cooled bleed air enters the compressor section of the aircycle machine and is compressed to a higher pressure and temperature.
It is again cooled in the main heat exchanger, and enters the turbine section where it expands. In expanding, it generates power to drive the compressor and cooling air fan.
The removal of energy during this process reduces the air temperature, resulting in a very low air temperature at turbine discharge.
The temperature control valve can modify the pack outlet temperature by adding uncooled air to the turbine outlet flow.
In case of an air cycle machine failure, bleed air is only cooled by the corresponding heat exchanger only.

PACK FLOW CONTROL VALVE

Ident.: DSC-21-10-20-00000778.0001001 / 30 AUG 18
Applicable to: ALL

This valve is pneumatically-operated and electrically-controlled. It regulates the air flow in accordance with signals received from the pack controller.
In the absence of air pressure, a spring keeps the valve closed.
In the absence of electrical supply, the valve is open in a position equivalent to the HIGH selection, provided air supply is available.
The valve closes automatically in case of pack overheating (on ground only), engine starting, operation of the fire or ditching pushbuttons, any unclosed doors at engine start, or insufficient upstream pressure. The valve is controlled from the AIR panel.

EMERGENCY RAM AIR

Ident.: DSC-21-10-20-00000779.0001001 / 11 JAN 17
Applicable to: ALL

An emergency ram air inlet ventilates the cockpit and cabin, if both packs fail.
The emergency ram air inlet valve is controlled by the RAM AIR pb on the AIR COND panel.
This pushbutton opens the ram air valve, provided that ditching is not selected.
The outflow valves open about 50 %, provided that they are under automatic control and ΔP is less than 1 PSI. They do not automatically open if they are under manual control, even if the ΔP is less than 1 PSI. If ΔP is greater than 1 PSI, the check valve, located downstream the ram air door, will not open. No airflow will then be supplied.

MIXER UNIT

Ident.: DSC-21-10-20-00000780.0001001 / 21 MAR 16
Applicable to: ALL

This unit mixes cold fresh air from the packs with the cabin air being recirculated through recirculation fans. The mixer unit is also connected to the emergency ram air inlet and the low pressure ground inlets.

Note: *In case both packs are inoperative, the recirculation valves are partially closed.*

HOT AIR VALVES

Ident.: DSC-21-10-20-00000781.0001001 / 21 MAR 16
Applicable to: ALL

These valves regulate the pressure of hot air, tapped upstream of the packs.

They are pneumatically-operated and electrically-controlled from the HOT AIR 1 and HOT AIR 2 pushbuttons on the AIR panel. In the absence of electrical supply, the hot air valves are closed. In the absence of air pressure, a spring keeps the valve closed.
The valve closes automatically, if the duct overheats.

TRIM AIR VALVES

Ident.: DSC-21-10-20-00000782.0001001 / 21 MAR 16
Applicable to: ALL

These valves are electrically-controlled by the zone controller. Trim air valves, associated with each zone, adjust the temperature by adding hot air from the two hot air manifolds.
For the cockpit supply, only one trim air valve is fitted to regulate air from the hot air manifold 2. Air from the hot air manifold 1 passes through a restrictor.

HOT AIR X VALVE

Ident.: DSC-21-10-20-00000783.0001001 / 21 MAR 16
Applicable to: ALL

A HOT AIR cross-valve is fitted between the two hot air manifolds. The valve is normally closed. It automatically opens, if one hot air supply fails.

Intentionally left blank

GENERAL

Ident.: DSC-21-10-30-00000784.0001001 / 21 MAR 16
Applicable to: ALL

Temperature regulation is automatic and controlled by one zone controller and two pack controllers.

SYSTEM OPERATION

Ident.: DSC-21-10-30-00020646.0002001 / 17 MAR 17
Applicable to: ALL

SYSTEM OPERATION

The cabin is divided into 3 temperature control zones : FWD, MID and AFT. The length of the three zones is, as far as practicable, adapted to the individual cabin class arrangement by respective programming of the CIDS.
The cockpit cabin temperature selector is used to select prior to flight a common cabin master temperature for all zones.
The common master temperature can be individually adapted for the three cabin zones at any time via the cabin temperature page of the Programming and Indication Modul (PIM) on the forward attendant panel. An individual zone correction up to +/– 3 °C (5.4 °F) can be selected for the FWD, MID or AFT cabin zones in steps of 0.5 °C (0.9 °F).

PACK CONTROLLER

Ident.: DSC-21-10-30-00000785.0003001 / 21 MAR 16
Applicable to: ALL

Each pack controller regulates the temperature of its associated pack, in accordance with a demand signal from the zone controller, by modulating the temperature control valve and the ram air inlet flaps and the ram air outlet flaps.
The ram air inlet and outlet flaps close during takeoff and landing to avoid ingestion of foreign objects.

Note: *During takeoff, the ram air inlet and outlet flaps close when the thrust lever is at or above CL detent.*
During landing, they close as soon as the landing gear is compressed, when the speed is at or above 70 kt.
They open, when the speed is below 70 kt, with a 10 s delay.

The pack controllers also provide flow regulation by modulating the associated pack flow control valve, in accordance with the zone controller demand.

ZONE CONTROLLER

Ident.: DSC-21-10-30-00018214.0004001 / 21 MAR 16
Applicable to: ALL

PACK FLOW CONTROL

The flight crew can use the PACK FLOW selector to adjust the pack flow for the number of passengers and the external conditions. When the selector is in the AUTO position ◁ , the air flow is automatically managed by the pack controller, depending on the number of passengers entered in the MCDU. However, the other positions can be selected to comply with warnings, cautions, or cabin needs.

Whatever the flight crew selects, the system receives a high flow demand for any of the following circumstances :
- Single pack operation, or
- When the APU is supplying bleed air.

Note: Due to ambient conditions, high flow may not be achieved.

ENGINE PRESSURE DEMAND

When the cooling demand in one zone cannot be satisfied, if the bleed pressure is too low, the zone controller sends a pressure demand signal to both engines' Engine Interface Units (EIU), in order to increase the minimum idle and to raise the bleed pressure.

APU FLOW DEMAND

When the APU bleed valve is open, the zone controller signals the APU Electronic Control Box (ECB) to increase the APU flow output when any zone temperature demand cannot be satisfied.

BLEED TEMPERATURE DEMAND

If the cooling demand cannot be satisfied, the zone controller signals the Bleed Monitoring Computer (BMC) to decrease the bleed temperature from normal (200 °C) to reduced setting (150 °C). This reduction is inhibited, if the wing-anti ice is ON.

TEMPERATURE REGULATION

Ident.: DSC-21-10-30-00000787.0001001 / 26 MAY 14
Applicable to: ALL

The zone controller regulates the cabin and cockpit temperature.

BASIC TEMPERATURE REGULATION

The flight crew uses the temperature selectors on the air conditioning panel in the cockpit to select the reference temperature. The flight attendant adjusts the cabin temperature from the Forward Attendant Panel (FAP).
An automatic temperature altitude correction may be added to the cockpit-selected temperature to compensate for the reduction in cabin air humidity and reduction of cabin lining temperatures. The altitude correction is proportional to the flight altitude and is programmable. The initial manufacturer setting is that no altitude correction is added.
The zone controller computes a temperature demand, depending on the selected temperature and the actual temperature.

The actual temperature is measured by sensors in the:
- Cockpit
- Lavatory extraction circuit and galley ventilation system for the cabin.

A signal corresponding to the lowest demanded zone temperature goes to the pack controller, which then makes both packs produce the required outlet temperature.

OPTIMIZED TEMPERATURE REGULATION

The zone controller optimizes temperature by acting on the trim air valves.
The cockpit crew can select temperatures between the range of 18 °C (64 °F) and 30 °C (86 °F).

CABIN TEMPERATURE SELECTION

Ident.: DSC-21-10-30-00020647.0001001 / 17 MAR 17
Applicable to: ALL

CABIN TEMPERATURE SELECTION

The system is designed to minimize flight crew workload. The cockpit and cabin selections should be set only once prior to flight. Throughout the flight the system takes care of cabin temperature regulation and under normal operating conditions there is no need to change the selection during flight.
It is recommended to follow these guidelines :

Note: *Any change of selection makes the system blow either colder or hotter air into the cabin which may result in a temporary discomfort for the passengers. To reach a stabilized cabin temperature again the system needs about 20 min : 10 min cabin temperature adjustment plus 10 min to compensated for furniture and lining heat dissipation. After a selection has been changed allow the cabin temperature to stabilize again before the selection is changed again.*

On ground, prior to flight:

1. The cabin temperature selector in the cockpit (AIR panel) should be set to about the 10 o'clock position (21.5 °C/70.7 °F) for ground and flight operation.
2. The zone correction should be set to zero by pressing the <<RESET TO COCKPIT SELECTED TEMP>> soft key on the cabin temperature page of the PIM.
   The above settings provide a good cabin temperature comfort for most operating conditions.

In flight:

1. The master temperature preselection on the cockpit panel should normally not be changed during flight.
   If a cockpit preselection change is required, the cabin crew should be informed since, in the cabin, there is no automatic indication associated.

   Note: *The PIM cabin temperature page will show the newly-selected cabin temperature (+ zone correction + altitude correction) in each of the cabin zones.*

2. If required, the cabin crew should normally adjust the zone temperature on the forward attendant panel, by no more than 0.5 °C (0.9 °F).

   Note: *1. Generally, the lowest comfortable temperature should be selected.*
   2. It is recommended that the cabin crew judge the required zone temperature, based on the temperature that is felt, rather than on the indicated value.

COCKPIT CREW - INDIVIDUAL HEATERS ◁

Ident.: DSC-21-10-30-00018249.0002001 / 21 MAR 16
Applicable to: ALL

The ambient temperature of the cockpit is regulated via the COCKPIT selector, located on the AIR panel.
To compensate for the sun's effect on cockpit temperature, two electrical heaters are installed : One on each side of the cockpit. These additional heaters are controlled via the HEATER selector or the applicable HEATER CAPT sw ◁ and HEATER F/O sw ◁ on the AIR panel. Each heater includes a protection against overheating.
The cockpit ambient temperature is selected on the AIR panel by the pilot who feels the hottest (the one in direct sunlight). The pilot who feels the coldest can increase the temperature on his side by selecting LO or HI on the HEATER selector or the applicable HEATER CAPT sw ◁ and HEATER F/O sw ◁ .

GENERAL

Ident.: DSC-21-10-40-00018250.0001001 / 21 MAR 16
Applicable to: ALL

Each Controller has a Channel 1 (that is normally in control), and a Channel 2 (that acts as a backup, if Channel 1 fails).

ZONE CONTROLLER

Ident.: DSC-21-10-40-00018252.0002001 / 21 MAR 16
Applicable to: ALL

CHANNEL 1 OR 2 FAILURE

A Channel 1 or 2 failure has no effect on zone temperature regulation.

CHANNELS 1 AND 2 FAILURE

Optimized and backup temperature regulation are lost. The packs deliver a fixed pack outlet temperature of 20 °C (68 °F). A Channel 1 and 2 failure removes all information from the COND SD page, which then displays “PACK REG”. Flow selection from the PACK FLOW selector is lost.

Note: *"PACK REG" indication on COND SD page is not applicable to A340-500/600 aircraft.*

PACK CONTROLLERS

Ident.: DSC-21-10-40-00018253.0004001 / 21 MAR 16
Applicable to: ALL

CHANNEL 1 OR 2 FAILURE

A Channel 1 or 2 failure has no effect on pack regulation.

CHANNELS 1 AND 2 FAILURE

The corresponding anti-ice valve regulates the pack outlet temperature between approximately 9 °C and 15 °C (respectively 48 °F and 59 °F). The ECAM signals, associated with the corresponding pack, are lost. The flow control valve pneumatically regulates the pack flow to approximately 120 % of the NORM flow.

AIR CYCLE MACHINE FAILURE

Ident.: DSC-21-10-40-00000812.0003001 / 31 AUG 18
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

If the Air Cycle Machine (ACM) fails (compressor/turbine seizure), the affected pack may be operated in the heat-exchanger cooling mode. Warm pre-conditioned bleed air enters the cooling path, via the pack flow control valve, and goes to the primary heat exchanger. Then, the compressor check valve opens, and air is cooled only by the heat exchanger. The ACM seizure reduces the pack flow.

As in normal pack operation :

- The pack controller regulates temperature, in accordance with zone controller demand, by modulating the temperature control valve and the ram air inlet and outlet flaps.
- The zone controller regulates the flow of hot air, through the trim air valves, to optimize cockpit/cabin temperature regulation. Hot air flow is lower than in normal pack operation, because the pack flow is reduced.

Note: *A pack with a seized ACM must be switched off on ground, due to the unavailability of RAM air cooling.*

AIR CYCLE MACHINE FAILURE

Ident.: DSC-21-10-40-00000812.0001001 / 21 MAR 16
Applicable to: LV-GKO, LV-GKP

If the Air Cycle Machine (ACM) fails (compressor/turbine seizure), the affected pack may be operated in the heat-exchanger cooling mode. Warm pre-conditioned bleed air enters the cooling path, via the pack flow control valve, and goes to the primary heat exchanger. Then, the compressor check valve and the bypass valve open, and air is cooled only by the heat exchanger. The ACM seizure reduces the pack flow.

As in normal pack operation :

- The pack controller regulates temperature, in accordance with zone controller demand, by modulating the temperature control valve and the ram air inlet and outlet flaps.
- The zone controller regulates the flow of hot air, through the trim air valves, to optimize cockpit/cabin temperature regulation. Hot air flow is lower than in normal pack operation, because the pack flow is reduced.

Note: *A pack with a seized ACM must be switched off on ground, due to the unavailability of RAM air cooling.*

HOT AIR VALVES FAILURE

Ident.: DSC-21-10-40-00000813.0001001 / 21 MAR 16
Applicable to: ALL

One or both valves failed open	:	No effect.
One valve failed closed	:	No effect (HOT AIR X valve opens)
Both valves failed closed	:	Optimized regulation is lost. Trim air valves are driven to full closed position. Packs only regulate the temperature.

TRIM AIR VALVE FAILURE

Ident.: DSC-21-10-40-00000814.0001001 / 21 MAR 16
Applicable to: ALL

Failed closed	:	Optimized temperature regulation of half of the corresponding zone is lost.
Failed open	:	Corresponding hot air valve closes. Optimized temperature regulation of half of each zone is lost.

Intentionally left blank

(1) PACK pb

On : The pack flow control valve is automatically controlled.

It opens except in the following cases:

- Upstream pressure below minimum
- Compressor outlet overheat
- Engine start sequence:
  1. One valve (or both, if the crossbleed valve is open) closes when:
     - The MODE selector is set to IGN, when on ground (valves reopen if MASTER switch or MAN START pushbutton are not set to ON within 30 s);
     - The MODE selector is set to IGN (or CRANK) and when on either engine:
       - The MASTER switch is set to ON (or MAN START pushbutton is set to ON) and,
       - The start valve is open and
       - N2 < 50 %.
  2. On ground, the valve reopening is delayed 1 min to avoid an extra pack closure cycle during subsequent engine start:
- Any door is not closed and locked, aircraft on ground and any engine running
- Fire pushbutton pressed for the engine on the related side
- Ditching is selected.

Note: *If there is no electrical power, the flow control valves remain open and permit NORM flow.*

OFF : The pack flow control valve closes provided it is electrically-supplied.

FAULT lt : The amber light and associated ECAM caution come on, when the pack flow control valve position disagrees with the selected position, or in the case of compressor outlet overheat or pack outlet overheat.

(2) PACK FLOW selector

Enables pack flow selection, depending on the number of passengers and ambient conditions (smoke removal, hot or wet conditions) : LO (80 %) - NORM (100 %) - HI (120 %). In case one bleed fails, the flow is limited to 80 %. Any selection is irrelevant in single pack operation, or with APU bleed supply. In these cases, a 125 % airflow is automatically selected.

Note: *The pack flow values given in percentage of the normal flow assume that the cargo cooling selector* ❄ *is on the OFF position or not installed.*

(3) Zone temperature selector

- 12 o'clock position: 24 °C (76 °F)
- COLD position: 18 °C (64 °F)
- HOT position: 30 °C (86 °F).

(4) HOT AIR 1 (or 2) pushbutton

On : The valve regulates hot air pressure.

OFF : The valve closes. The FAULT circuit is reset.

FAULT lt : The amber light and associated ECAM caution come on, when a duct overheat is detected (88 °C/190 °F). The valve, and the associated trim air valves close automatically. The FAULT light goes off, when the temperature drops below 70 °C (158 °F), and the flight crew selects OFF.

(5) RAM AIR pushbutton (guarded)

ON : The ON light comes on white.

If the DITCHING pb, on the CABIN PRESS panel, is in normal position:
- The emergency ram air inlet opens
- If $\Delta P < 1$ PSI: Each outflow valve opens to about 50 % when under automatic control. They do not automatically open when under manual control. The emergency ram air flow is directly supplied to the mixer unit
- If $\Delta P \geq 1$ PSI: Each outflow valve remains normally-controlled. No emergency ram air flows in.

Off : The emergency ram air inlet closes, and the outflow valves return to the normal position.

Note: *If there is no electrical power, the flow valves remain open and permit NORM flow.*

OFF : The pack flow control valve closes, provided it is electrically-supplied.

FAULT lt : The amber light and associated ECAM caution come on, when the pack flow control valve position disagrees with the selected position, or in the case of compressor outlet overheat or pack outlet overheat.

(2) PACK FLOW selector

Enables pack flow selection, depending on the number of passengers and ambient conditions (smoke removal, hot or wet conditions). LO (80 %) – NORM (100 %) – HI (120 %). In case one bleed fails, the flow is limited to 80 %. Any selection is irrelevant in single pack operation, or with APU bleed supply. In these cases, a 125 % airflow is automatically selected.

Note: *The pack flow values given in percentage of the normal flow assume that the cargo cooling selector ◁ is on the OFF position or not installed.*

(3) Zone temperature selector

- 12 o'clock position: 24 °C (76 °F)
- COLD position: 18 °C (64 °F)
- HOT position: 30 °C (86 °F).

(4) HOT AIR 1 (or 2) pushbutton

On : The valve regulates hot air pressure.

OFF : The valve closes. The FAULT circuit is reset.
Forward cargo heating is lost, if HOT AIR 1 is affected.

FAULT lt : The amber light and associated ECAM caution come on, when a duct overheat is detected (88 °C/190 °F). The valve, and the associated trim air valves close automatically. The FAULT light goes off, when the temperature drops below 70 °C (158 °F), and the flight crew selects OFF.

(5) RAM AIR pushbutton (guarded)

ON : The ON light comes on white.

If the DITCHING pb, on the CABIN PRESS panel, is in the normal position:
- The emergency ram air inlet opens
- If $\Delta P < 1$ PSI: Each outflow valve opens to about 50 % when under automatic control. They do not automatically open when under manual control. The emergency ram air flow is directly supplied to the mixer unit
- If $\Delta P \geq 1$ PSI: Each outflow valve remains normally-controlled. No emergency ram air flows in.

Off : The emergency ram air inlet closes, and the outflow valves return to the normal position.

(1) PACK pb

On : The pack flow control valve is automatically controlled.

It opens, except in the following cases:

- Upstream pressure below minimum
- Compressor outlet overheat
- Engine start sequence:
  1. One valve (or both, if the crossbleed valve is open) closes when:
     - The MODE selector is set to IGN, when on ground (valves reopen if MASTER switch or MAN START pushbutton are not set to ON within 30 s) :
     - The MODE selector is set to IGN (or CRANK) and when (on either engine) :
       - The MASTER switch is set to ON (or MAN START pushbutton is set to ON) and,
       - The start valve is open and
       - N3 < 50 %.
  2. On ground, reopening of the valves is delayed 1 min to avoid a supplementary pack closure cycle during subsequent engine start:
- Any door is not closed and locked, aircraft on ground, and any engine running
- Fire pushbutton pressed for the engine on the related side
- Ditching is selected.

Note: If there is no electrical power, the flow valves remain open and permit NORM flow.

OFF : The pack flow control valve closes, provided it is electrically-supplied.

FAULT lt : The amber light and associated ECAM caution come on, when the pack flow control valve position disagrees with the selected position, or in the case of compressor outlet overheat or pack outlet overheat.

(2) PACK FLOW selector

Enables pack flow selection, depending on the number of passengers and ambient conditions (smoke removal, hot or wet conditions). LO (80 %) – NORM (100 %) – HI (120 %). In case one bleed fails, the flow is limited to 80 %. Any selection is irrelevant in single pack operation, or with APU bleed supply. In these cases, a 125 % airflow is automatically selected.

Note: The pack flow values given in percentage of the normal flow assume that the cargo cooling selector ◁ is on the OFF position or not installed.

(3) Zone temperature selector

- 12 o'clock position: 24 °C (76 °F)
- COLD position: 18 °C (64 °F)
- HOT position: 30 °C (86 °F).

(4) HOT AIR 1 (or 2) pushbutton

On : The valve regulates hot air pressure.

OFF : The valve closes. The FAULT circuit is reset.
Forward cargo heating is lost, if HOT AIR 1 is affected.

FAULT lt : The amber light and associated ECAM caution come on, when a duct overheat is detected (88 °C/190 °F). The valve, and the associated trim air valves close automatically. The FAULT light goes off, when the temperature drops below 70 °C (158 °F), and the flight crew selects OFF.

(5) RAM AIR pushbutton (guarded)

ON : The ON light comes on white.

If the DITCHING pb, on the CABIN PRESS panel, is in the normal position:
- The emergency ram air inlet opens
- If $\Delta P < 1$ PSI: Each outflow valve opens to about 50 % when under automatic control. They do not automatically open when under manual control. The emergency ram air flow is directly supplied to the mixer unit
- If $\Delta P \geq 1$ PSI: Each outflow valve remains normally-controlled. No emergency ram air flows in.

Off : The emergency ram air inlet closes, and the outflow valves return to the normal position.

(1) HOT AIR indication
Normally green.
Becomes amber if the flow control valve is fully closed.

(2) Hot air valve indication

In line green : normally open (not fully closed).

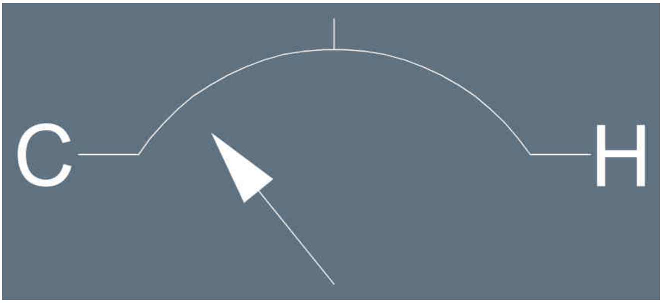
Crossline green : normally closed (fully closed).

Crossline amber :
- Valve is abnormally closed, or
- Flow Control Valve 1(2) is closed, or
- The respective HOT AIR pb is OFF, or
- There is a duct overheat for the related Trim Air Valve.

In line amber : not fully closed and controlled closed.

(3) Hot air x valve indication
Identical to the HOT AIR valve indication

(4) Trim air valve position indication



The arrow is normally green. It is replaced by amber crosses (“XX”) if the valve fails.

C : The valve is fully closed.

H : The valve is fully open.

Note: The number of trim air valves vary, depending on the cabin configuration.

(5) Zone duct temperature indication
It is normally in green.
It becomes amber above 88 °C.
It remains amber, until the temperature is below 70 °C.

(6) Zone temperature indication
It is in green.

Note: The temperature of the cockpit and of the cabin zones 1, 3 and 5 are also displayed on the ECAM CRUISE page.

(7) PACK REG indication
It is in green when, the zone controller is inoperative (both channels fail).
Temperature is regulated by the packs only.

(8) FAN indication
It is in amber, if the fan fails, or if it is selected OFF, via the CAB FANS pb.

(9) PACK LO FLOW indication
It pulses in green, when the flow is insufficient to reach the selected temperature.
This indicates that the zone controller requests an increase in flow.

Intentionally left blank

GENERAL

Ident.: DSC-21-20-10-00018216.0007001 / 21 MAR 16
Applicable to: ALL

In normal operation, pressurization control is fully automatic.

The system consists of :
- Two Cabin Pressure Controllers (CPC)
- One Residual Pressure Control Unit (RPCU) ◁
- Two outflow valves, with actuators that incorporate three motors (two for automatic operation, one for manual operation)
- One control panel
- Three safety valves
- One negative relief valve

Any one of the three independent electric motors can power the outflow valves.
Normally, one of the two cabin pressure controllers operates the outflow valves by means of its associated automatic motor. In case of ditching, an override switch on the control panel allows the flight crew to close the outflow valves, and all valves below the flotation line.

AUTOMATIC OPERATION

Ident.: DSC-21-20-10-00000792.0002001 / 21 NOV 11
Applicable to: ALL

The system can be fully or semi-automatic.
In fully-automatic operation :
Cabin pressurization is achieved from internal or external schedules, when appropriate FMGES inputs are available.
In automatic operation, a ΔP limiting function monitors differential pressure.
When FMGES data are not available, the crew needs to select the landing field elevation. The pressurization system then uses the manually-selected landing field elevation for internal schedules.

Note: *In semi-automatic operation, one outflow valve is controlled automatically and the other is controlled manually.*

MANUAL OPERATION

Ident.: DSC-21-20-10-00000793.0001001 / 21 MAR 16
Applicable to: ALL

In manual mode, the flight crew controls the cabin altitude via the manual motor of the outflow valves, by operating controls on the pressurization control panel.
Manual operation has priority over all other modes.

CABIN PRESSURE CONTROLLERS

Ident.: DSC-21-20-20-00000795.0002001 / 15 FEB 11
Applicable to: ALL

Two identical, independent, automatic controllers are used for cabin pressure control. They receive signals from the Air Data Inertial Reference System (ADIRS), the Flight Management Guidance and Envelope Computer (FMGEC), the Engine Interface Unit (EIU), the Landing Gear Control Interface Unit (LGCIU), the Proximity Switch Control Unit (PSCU) and the pack flow control valves. They perform the automatic cabin pressure control. They generate signals for the ECAM. In automatic mode, one controller is active, the other is on standby.
For operation in manual mode, each controller has a backup section, which is powered by an independent power supply in the controller N° 1 position. This section also has a pressure sensor that generates the cabin altitude and pressure signal for the ECAM, when MAN mode is selected.
The controllers communicate with each other via a cross-channel link.

OUTFLOW VALVES

Ident.: DSC-21-20-20-00000796.0002001 / 21 MAR 16
Applicable to: ALL

Two outflow valves are located below the flotation line. Each outflow valve assembly consists of a flush, skin-mounted, rectangular frame, carrying inward and outward opening flaps linked to the actuator. The actuator contains the drives of two electric motors, and the drive of a third electric motor. Either of two electric motors operates the valve in automatic mode, and a third electric motor operates it in manual mode. To allow an easy and smooth control of the cabin's vertical speed in manual mode, the outflow valves move at a slower speed than in automatic mode.
In automatic mode, the operating controller signals the position of the valve to the ECAM.
In manual mode, the backup section of the N° 1 controller signals the position of the valve to the ECAM.
The outflow valves automatically close, if the cabin altitude reaches 15 000 ft, provided that the valves are in automatic mode.
When one pack is OFF and ΔP is above 4 PSI, the aft outflow valve closes and the forward outflow valve controls the cabin pressure.

Note: *When the RAM AIR pushbutton is ON, and ΔP is below 1 PSI, the system drives the outflow valves about 50 % open if it is under automatic control. If the system is under manual control, the outflow valves do not automatically open, even if ΔP is below 1 PSI.*

SAFETY VALVES

Ident.: DSC-21-20-20-00000797.0002001 / 21 MAR 16
Applicable to: ALL

Three independent pneumatic safety valves prevent the cabin pressure from going too high (8.85 PSI above external ambient pressure) or too low (0.73 PSI below external ambient pressure). They are on the rear pressure bulkhead, above the flotation line.

NEGATIVE RELIEF VALVE

Ident.: DSC-21-20-20-00018212.0001001 / 21 MAR 16
Applicable to: ALL

The negative relief valve is installed below the floor level, aft of left door n° 1, above the floatation line.
It assists the safety valves in preventing the cabin pressure from going too low.

RESIDUAL PRESSURE CONTROL UNIT (RPCU)

Ident.: DSC-21-20-20-00018211.0001001 / 04 DEC 18
Applicable to: ALL

The Residual Pressure Control Unit (RPCU) automatically depressurizes the aircraft in case of abnormal residual pressure on ground. The RPCU may automatically open the forward, and respectively aft, outflow valves, when:
- The forward, and respectively aft, outflow valves are not fully open, and
- Both Cabin Pressure Controllers (CPC) are failed, or manual mode is selected, and
- The aircraft is on ground, and
- All engines are shutdown, or all ADIRS indicate an airspeed below 100 kt.

AUTOMATIC PRESSURE CONTROL MODE

Ident.: DSC-21-20-30-00000801.0003001 / 21 NOV 11
Applicable to: LV-GKO, LV-GKP

- Two identical, independent, automatic systems (each consisting of a controller and its associated motors) control cabin pressure.
  Either system controls the two outflow valves.
  Only one controller operates at a time.

  An automatic transfer occurs:
  - 80 s after each landing.
  - If the operating system fails.
- The controller normally uses the landing elevation and the QNH from the FMGEC, and the pressure altitude from the ADIRS.
  If FMGEC data are unavailable, the controller uses the Captain BARO Reference from the ADIRS and the LDG ELEV selection.
- Pressurization is assumed through the following modes:

GROUND (GND)

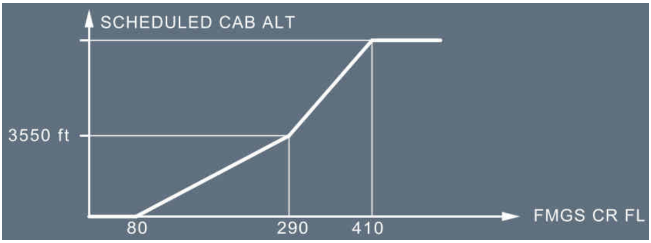
Before takeoff, and 80 s after landing, the system keeps the outflow valves fully open to ensure there is no residual pressure differential inside the aircraft.
At touchdown, to release the remaining cabin overpressure, a depressurization sequence controls the cabin V/S at +500 ft/min.

TAKEOFF (TO)

To avoid a pressure surge at rotation, the controller prepressurizes the aircraft at a rate of -328 ft/min until the pressure differential reaches 0.1 PSI. At lift off, the controller initiates the climb phase.

CLIMB IN INTERNAL MODE (CI)

CAB V/S varies, according to a preprogrammed law, in order to reach the scheduled CAB ALT at the top of climb defined by the FMGES cruise FL.
The CAB V/S is limited to 1 000 ft/min.



The LDG ELEV selector has no effect in climb.
If the FMGES CR FL is not available, the CPCS uses the FL 410 default value.

CLIMB IN EXTERNAL MODE (CE)

CAB ALT varies according to FMGES estimated times and planned cruise FL.
The cabin climb rate is limited to 1 000 ft/min.

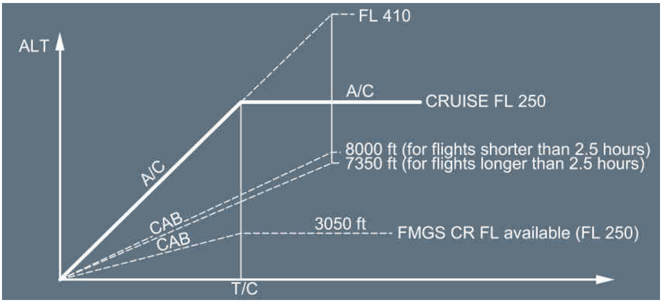
CRUISE (CRZ)

As long as the aircraft remains in level flight, the CPC maintains the cabin altitude at the value reached at top of climb.

The cabin altitude cannot exceed:
- 7 350 ft for flights longer than 2.5 h, or
- 8 000 ft for flights shorter than 2.5 h.

However, if the flight crew sets (manually or in the FMGES) a LDG ELEV higher than the current cabin altitude, the cabin altitude cannot exceed 8 000 ft.

Note: If the takeoff runway is higher than 8 000 ft, the cabin altitude during climb is controlled to 8 000 ft.



DESCENT IN INTERNAL MODE (DI)

Pressure rate is optimized so that cabin pressure reaches landing field pressure +0.1 PSI just prior to landing. The cabin descent rate is limited to 750 ft/min.

DESCENT IN EXTERNAL MODE (DE)

CAB altitude varies according to FMGES-estimated times, and cabin pressure reaches landing field pressure +0.1 PSI just prior to landing.
The cabin descent rate is limited to 750 ft/min.

ABORT (AB)

The abort mode prevents the cabin altitude from climbing, if the aircraft does not climb after takeoff.
Cabin pressure is set back to the takeoff altitude +0.1 PSI.

GROUND (AFTER LANDING) (GND)

At touchdown, to release the remaining ∆P a depressurized sequence controls the cabin vertical speed at +500 ft/min.
80 s after landing the outflow valves are controlled fully open to ensure there is no residual ∆P in the aircraft.

AUTOMATIC PRESSURE CONTROL MODE

Ident.: DSC-21-20-30-00000801.0010001 / 21 NOV 11
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

- Two identical, independent, automatic systems (each consisting of a controller and its associated motors) control cabin pressure.
  Either system controls the two outflow valves.
  Only one controller operates at a time.

  An automatic transfer occurs:
  - 80 s after each landing.
  - If the operating system fails.
- The controller normally uses the landing elevation and the QNH from the FMGEC, and the pressure altitude from the ADIRS.
  If FMGEC data are unavailable, the controller uses the Captain BARO Reference from the ADIRS and the LDG ELEV selection.
- Pressurization is assumed through the following modes:

GROUND (GND)

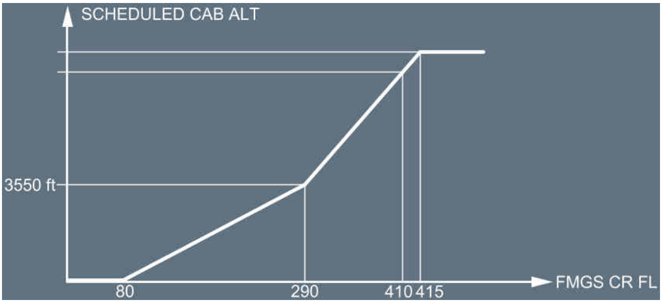
Before takeoff, and 80 s after landing, the system keeps the outflow valves fully open to ensure there is no residual pressure differential inside the aircraft.
At touchdown, to release the remaining cabin overpressure, a depressurization sequence controls the cabin V/S at +500 ft/min.

TAKEOFF (TO)

To avoid a pressure surge at rotation, the controller prepressurizes the aircraft at a rate of -328 ft/min until the pressure differential reaches 0.1 PSI. At lift off, the controller initiates the climb phase.

CLIMB IN INTERNAL MODE (CI)

CAB V/S varies, according to a preprogrammed law, in order to reach the scheduled CAB ALT at the top of climb defined by the FMGES cruise FL.
The CAB V/S is limited to 1 000 ft/min.



The LDG ELEV selector has no effect in climb.
FL 415 is the FMGES CR FL corresponding to the maximum operating altitude.
If the FMGES CR FL is not available, the CPCS uses the FL 410 default value.

CLIMB IN EXTERNAL MODE (CE)

CAB ALT varies according to FMGES estimated times and planned cruise FL.
The cabin climb rate is limited to 1 000 ft/min.

CRUISE (CRZ)

As long as the aircraft remains in level flight, the CPC maintains the cabin altitude at the value reached at top of climb.

The cabin altitude cannot exceed:
- 7 460 ft for flights longer than 2.5 h, or
- 8 000 ft for flights shorter than 2.5 h.

However, if the flight crew sets (manually or in the FMGES) a LDG ELEV higher than the current cabin altitude, the cabin altitude cannot exceed 8 000 ft

Note: *If the takeoff runway is higher than 8 000 ft, the cabin altitude during climb is controlled to 8 000 ft.*

DESCENT IN INTERNAL MODE (DI)

Pressure rate is optimized so that cabin pressure reaches landing field pressure +0.1 PSI just prior to landing. The cabin descent rate is limited to 750 ft/min.

DESCENT IN EXTERNAL MODE (DE)

CAB altitude varies according to FMGES-estimated times, and cabin pressure reaches landing field pressure +0.1 PSI just prior to landing.
The cabin descent rate is limited to 750 ft/min.

ABORT (AB)

The abort mode prevents the cabin altitude from climbing, if the aircraft does not climb after takeoff.
Cabin pressure is set back to the takeoff altitude +0.1 PSI.

GROUND (AFTER LANDING) (GND)

At touchdown, to release the remaining ΔP a depressurized sequence controls the cabin vertical speed at +500 ft/min.
80 s after landing the outflow valves are controlled fully open to ensure there is no residual ΔP in the aircraft.

MAXIMUM DIFFERENTIAL PRESSURE LIMITER FUNCTION

Ident.: DSC-21-20-30-00000800.0001001 / 21 NOV 11
Applicable to: ALL

This function is only available in automatic mode. If the differential pressure is above 8.70 PSI, the CPC maintains the Δp constant, to avoid over-pressurization. As a result, the outflow valves open and the CAB V/S increases. Once the differential pressure has decreased below the threshold, normal automatic control of the valves resumes; this generally causes the valves to go towards the closed position.

CAUTION	Except for the outflow valve position indication and the Δp value on the ECAM PRESS page, there is no indication in the cockpit that the limiter function is activated. Once the Δp limiter function has opened the valves, do not counteract the automatic operation by trying to close the valves in manual mode. Due to the slow movement of the outflow valves in manual mode, the valves cannot be closed fast enough and the cabin altitude quickly increases above 20 000 ft (even if an emergency descent is initiated simultaneously). The automatic mode provides the safest and the quickest way to reduce differential pressure, and recover normal pressure control.

MANUAL PRESSURE CONTROL MODE

Ident.: DSC-21-20-30-00000802.0001001 / 03 MAY 23
Applicable to: ALL

If both automatic systems fail, the flight crew may use the CABIN PRESS control panel to take over manual control of cabin pressurization:

- Press the MODE SEL pushbutton to select MAN, and
- Push the MAN V/S CTL toggle switch to the UP or DN position to increase or decrease cabin altitude.

Depending on the VALVE SEL position, the flight crew manually controls both, or only one, outflow valve(s).
If only one outflow valve is selected, the other one remains under automatic control.

Note: 1. *Due to the slow operation of the outflow valves in manual mode, and the limited resolution of the outflow valves position on the ECAM, the change of the outflow valves position can take up to 5 s on the CAB PRESS SD page.*
2. *ΔP and CAB ALT indications on the CAB PRESS SD page are replaced by "XX" in CPCS MAN mode for cabin altitude below -2 060 ft or above 26 250 ft.*
3. *As the pressurization system is manually controlled, in the case no RPCU is installed, the outflow valves do not automatically open at touchdown. If the RPCU is installed, the outflow valves open automatically.*

DITCHING

Ident.: DSC-21-20-30-00000803.0004001 / 21 MAR 16
Applicable to: ALL

To prepare for ditching, the flight crew must press the DITCHING pushbutton on the CABIN PRESS control panel to close the outflow valves, the emergency ram air inlet, the avionics ventilation overboard valve, and the pack flow control valves.

PREVENTION OF PRESSURIZATION WITH A DOOR NOT CLOSED AND LOCKED

Ident.: DSC-21-20-30-00000804.0001001 / 21 MAR 16
Applicable to: ALL

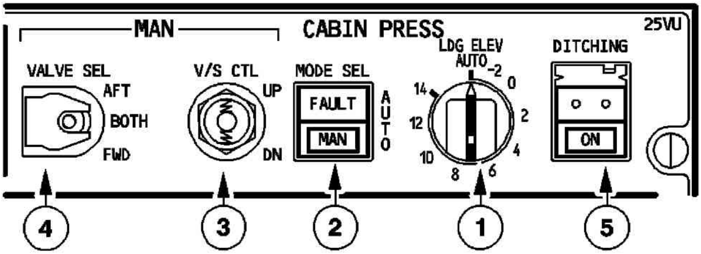
On ground, at takeoff power application, if at least one door is not closed and locked, the CPC will remain in ground mode (outflow valves open).

Note: *As a backup, the zone controller closes the pack valves (Refer to DSC-21-10-30 Zone Controller).*

Intentionally left blank

OVERHEAD PANEL

Ident.: DSC-21-20-40-00000805.0005001 / 08 OCT 12
Applicable to: ALL



(1) LDG ELEV selector

AUTO : The pressurization system uses the FMGEC data to construct an optimized pressure schedule.
To leave the AUTO position, pull out and turn the selector.

Other positions : The pressurization schedule does not use the landing elevation from the FMGEC, but instead uses the landing elevation selected with this knob (from -2 000 to 14 000 ft) as its reference.

Note: *The LDG ELEV selector scale is only given as an indication (refer to the ECAM information for accurate adjustment)*

(2) MODE SEL pb

AUTO : Automatic mode is operating. One of the two systems controls the outflow valves.

MAN : This legend appears in white, and FAULT does not come on. The flight crew then uses the MAN V/S CTL selector to control the system.

Note: *Switching the MODE SEL pb to MAN, for at least 3 s, then returning it to AUTO will select the other system.*

FAULT lt : This legend appears in amber and the ECAM caution only comes on when both automatic systems are faulty.

Note: *The pilot may notice variations (up to ± 1 000 ft) in the CAB ALT indication on the ECAM PRESS page, when the system switches from the cabin pressure control AUTO mode to MAN mode, due to reduced resolution of the backup pressure sensor.*

(3) V/S CTL sw

The switch is springloaded to neutral and controls the outflow valve position selected through the VALVE SEL. It controls the MAN motor, when the MODE SEL pb is in the MAN position.

UP : The valve(s) move(s) towards the open position.

DN : The valve(s) move(s) towards the closed position.

(4) VALVE SEL selector

AFT	The aft outflow valve can be manually controlled. The forward outflow valve remains under automatic control.
BOTH (guarded position)	Both outflow valves can be manually controlled.
FWD	The forward outflow valve can be manually controlled. The aft outflow valve remains under automatic control.

(5) DITCHING pb (guarded)

Normal	The system functions normally.
ON	The outflow valves, emergency ram air inlet, avionics ventilation overboard valve, cargo compartment isolation valves and pack flow control valves close. The cargo extract fans stop automatically. The ON light appears in white.

Note: The outflow valve(s) will not close automatically, if it (they) is (are) under manual control.

CAUTION	On ground, if the DITCHING pb is set to ON, with the low pressure ground cart connected and all doors closed, a differential pressure will build up.

(1) LDG ELEV AUTO / MAN
The LDG ELEV indication is always white.

AUTO : appears in green when the LDG ELEV selector is in AUTO.
Becomes amber if the landing elevation is not transmitted by the FMGES.

MAN : appears in green when the LDG ELEV selector is not in AUTO.
Neither appear when the MODE SEL pb-sw is in MAN and the VALVE SEL selector is in BOTH, or when the LDG ELEV selector is faulty.

(2) Landing Elevation
Landing elevation selected either automatically by the FMGES or manually by the pilot appears in green. (But not when the MODE SEL pb is in MAN position and the VALVE SEL is in BOTH position).

(3) V/S FT/MIN (cabin vertical speed)
The analog and digital presentation appear in green when V/S is in the normal range.
The digital indication pulses, when the V/S is more than 1 800 ft/min in either climb or descent.

(4) ΔP PSI (Cabin differential pressure)
The analog and digital presentations appear in green when ΔP is the normal range.

They appear in amber when ΔP ≤ -0.2 PSI or ≥ 8.85 PSI.
The digital presentation pulses if ΔP > 1.5 PSI (resets at 1 PSI) during flight phase 7.

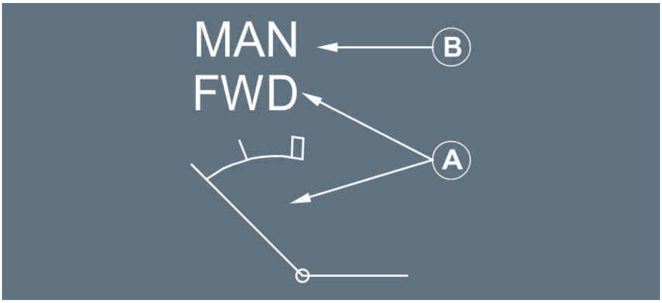
(5) CAB ALT FT (cabin altitude)
The analog and digital presentations appear in green, in normal range.
They appear in red if the cabin altitude goes above 9 550 ft.
The digital presentation pulses if the cabin altitude is between 8 800 ft and 9 550 ft.

(6) Active system indication (SYS 1 or SYS 2 or MAN)
SYS 1 or SYS 2 appears in green when active and in amber when faulty. When either system is inactive, its title does not appear.

(7) Safety valve position
SAFETY appears in white and the diagram in green when the three safety valves are fully closed.
SAFETY and the diagram appear in amber when at least one valve is not closed.

Note: The safety valves open when the cabin differential pressure is between 8.75 and 8.95 PSI.

(8) Forward outflow valve position



(A) When the valve is operating, normally, the needle appears in green and FWD appears in white.

Both become amber when the valve:
- Opens more than 95 % during flight, or
- Fails under automatic control.

(B) When the valve is under manual control MAN appears in green.

(9) Aft outflow valve position
Identical to the forward outflow valve.

GENERAL

Ident.: DSC-21-30-10-00018210.0001001 / 21 MAR 16
Applicable to: ALL

The ventilation system includes the avionics ground cooling ◁✻ and ventilation for :
- The avionics,
- The batteries,
- The lavatories and galleys,
- The pack bay.

Note: *Refer to DSC-21-40-10 General for a description of the cargo ventilation.*

Two computers are provided:
- The Avionic Equipments Ventilation Controller (AEVC), and
- The Ventilation Controller.

Intentionally left blank

GENERAL

Ident.: DSC-21-30-20-00000826.0001001 / 21 MAR 16
Applicable to: ALL

The avionics ventilation system is fully automatic.
It cools the electrical and electronic components, in the electronic bay and flight deck (including the instruments).
It uses air recirculated from the cabin, and extracts air from the different panels and equipments racks.

MAIN COMPONENTS

Ident.: DSC-21-30-20-00000825.0001001 / 21 MAR 16
Applicable to: ALL

TWO CABIN FANS

Two electric fans operate continuously, as long as the aircraft's electrical system is supplied.
These fans can be simultaneously cut off via the CABIN FAN pushbutton.
They make circulate the air around the avionics equipment, and blow to the mixer unit of the air conditioning system through the recirculation valves.

RECIRCULATION VALVES

The recirculation valves are normally open, and are partially closed automatically by the ventilation controller, when both packs are OFF (provided that both CABIN FANS are ON) to ensure sufficient air flow to avionic.

EXTRACT FAN

The extract fan operates continuously, as long as the aircraft's electrical system is supplied, and it blows air through the underfloor extract or overboard extract valve.

UNDERFLOOR AND OVERBOARD EXTRACT VALVES

These valves are fitted with actuators, controlled by the Avionics Equipment Ventilation Computer (AEVC), or by the EXTRACT pushbutton from the flight deck.
Air is blown overboard through the overboard extract valve.
Through the underfloor extract valve, air is blown under the forward cargo compartment, then overboard through the outflow valve.

COOLING EFFECT DETECTOR (CED)

This detector triggers an ECAM caution when the cooling capacity (flow and temperature) of the blown air is abnormal. On ground, it also activates the external horn and the external warning light.

AVIONICS EQUIPMENT VENTILATION COMPUTER (AEVC)

This Computer controls the position of the underfloor and OVBD extract valves.

SYSTEM OPERATION

Ident.: DSC-21-30-20-00000828.0004001 / 21 MAR 16
Applicable to: ALL

The cabin and the extract fans operate continuously. Air, recirculated from the cabin, is provided to the avionics compartment and the flight deck instrument panels.

Note: *In case of failure of two cabin fans, fresh air is blown from the packs.*

In normal operation, fresh air is blown by the extract fan :

- On ground, engines not running : Through the OVBD extract valve (the underfloor extract valve is closed).
- In flight, or on ground, with engines running : Through the underfloor extract valve (the OVBD extract valve is closed).

If OVRD is selected on the EXTRACT pushbutton, air is blown through the OVBD extract valve which is partially open (the underfloor extract valve is closed).
When the DITCHING pushbutton is ON, the OVBD extract valve is closed and the underfloor extract valve is open, whatever the position of the EXTRACT pushbutton.

Intentionally left blank

GENERAL

Ident.: DSC-21-30-30-00018209.0001001 / 21 MAR 16
Applicable to: ALL

The avionics ground cooling ◁ is fully automatic.
On ground, it ensures the cooling of the avionics ventilation air, in case of extremely hot outside air.
The cooling system is integrated in the avionics ventilation system, but operates independently.

Intentionally left blank

BATTERY VENTILATION

Ident.: DSC-21-30-40-00000829.0001001 / 21 MAR 16
Applicable to: ALL

A venturi in the aircraft skin draws air from the space around the batteries and vents it overboard. The resulting airflow ventilates the batteries.

Intentionally left blank

LAVATORY AND GALLEY VENTILATION

Ident.: DSC-21-30-50-00018196.0002001 / 21 MAR 16
Applicable to: ALL

The lavatory and galley are ventilated with air from main cabin distribution system.
Air is discharged outside through a venturi. On ground, or when ΔP < 1 PSI, it is extracted by an electrical fan controlled by the ventilation controller.
Ventilation of the cabin temperature sensors is connected to the extraction duct.

PACK BAY VENTILATION

Ident.: DSC-21-30-70-00000831.0004001 / 21 MAR 16
Applicable to: ALL

Ventilation of the pack bay ensures air circulation in order to maintain, on ground and in flight, a mean temperature that is compatible with the structure constraints in the relevant area.
In flight, air from the outside flows into the pack bay through a NACA air inlet.
On ground, a turbofan provides sufficient airflow.
The turbofan is driven by air from the bleed system, which is supplied through the turbofan supply valve. Controlled by the AEVC, the fan operates when the aircraft is on ground.
An ECAM warning, associated with an external horn on ground, is triggered in case of failure of the turbofan (supply valve failed closed or turbofan jammed).

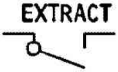
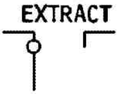
(1) OVBD extract valve position indication

This indicates that the OVBD extract valve is fully closed.



This indicates that the OVBD extract valve is partially open.



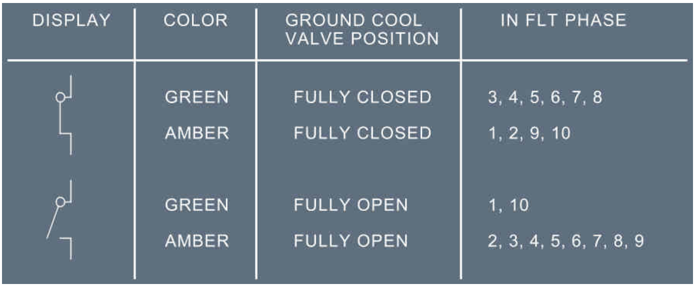
This indicates that the OVBD extract valve is fully open.

The EXTRACT indication normally appears in white and the valve symbol is in green.
Both become amber in case of an abnormal position.
If the valve position is not available, XX appears in amber.

(2) VENT indication

This normally appears in white.
It becomes amber in case of extract low flow.

(3) GND COOL VALVE position



DISPLAY	COLOR	GROUND COOL VALVE POSITION	IN FLT PHASE
	GREEN	FULLY CLOSED	3, 4, 5, 6, 7, 8
	AMBER	FULLY CLOSED	1, 2, 9, 10
	GREEN	FULLY OPEN	1, 10
	AMBER	FULLY OPEN	2, 3, 4, 5, 6, 7, 8, 9

(4) GND COOL indication

This normally appears in white.
It becomes amber when the ground cool valve is displayed in amber or when the ground cooling system is faulty.

Intentionally left blank

GENERAL

Ident.: DSC-21-40-10-00000004.0001001 / 21 MAR 16
Applicable to: ALL

The system provides ventilation and heating to the cargo compartments. It is controlled by the ventilation controller which has two channels. Channel 2 is a backup in case of channel 1 failure.

Intentionally left blank

BULK CARGO COMPARTMENT

Ident.: DSC-21-40-20-00000023.0002001 / 15 FEB 11
Applicable to: ALL

VENTILATION

Air from the cabin goes via the inlet isolation valve to the bulk cargo compartment, and is driven by an extraction fan. Air is controlled by the outlet isolation valve, goes to the bilge, then through the aft outflow valve.

NORMAL OPERATION

The cargo ventilation controller controls the inlet and outlet isolation valves and the extraction fan. The ventilation system operates when the isolation valves are open. To open the isolation valves, switch the BULK ISOL VALVE pb to the on position.

The controller closes the isolation valves and stops the extract fan, when:
- The flight crew selects the BULK ISOL VALVE pb to OFF, or
- The bulk cargo smoke detection unit detects smoke.

The outlet valve closes and the extract fan stops, when the flight crew sets the DITCHING pb to ON.
In case of overheat, the extract fan stops and the OVHT COND FANS RESET FAULT light comes on, on the maintenance panel.

HEATING

Bulk cargo compartment heating is performed by an electrical fan heater. Air from the cabin, driven by the electrical fan, goes into the compartment through a heating element. The temperature demand is selected from the cockpit.

NORMAL OPERATION

Provided the cargo door is closed, the heater operates when the temperature sensors indicate that the compartment air temperature is less than the selected one.

ON GROUND OPERATION

When the bulk cargo door is open, electrical power no longer supplies the heating element of the fan heater. Compartment heating is unavailable, as long as cargo door remains open.

FWD CARGO COMPARTMENT

Ident.: DSC-21-40-20-00004800.0005001 / 25 APR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

VENTILATION AND COOLING

Due to the extract fan suction, the cabin air flows through the inlet isolation valves into the forward cargo compartment, via the sidewall and ceiling inlets. Air is extracted through outlets, on the opposite sidewall, and goes via the extract fan and outlet isolation valve to the underfloor bilge area near the forward outflow valve.
To decrease compartment temperature, the inlet ventilation air is mixed with cold air from Pack 2. The cold air valve has three positions to adjust the quantity of cooled conditioned air that is mixed with the ventilation air. The valve position is selected from the cockpit.

Note: 1. *In general, if COOLING is selected at NORM or MAX, the parameters could be different between both packs.*
2. *Below 20 000 ft , pack 2 outlet temperature is limited to 5 °C, in order to avoid ice accumulation on the cold air valve.*

NORMAL OPERATION

The cargo ventilation controller controls the inlet and outlet isolation valves and the extraction fan.

The controller closes the isolation valves and stops the extract fan, when:
a. The FWD ISOL VALVE pb is switched OFF, or
b. The forward cargo smoke detection system is triggered, or
c. The DITCHING pb on the CABIN PRESS panel is switched ON.

In case of an overheat, the extract fan stops, and the OVHT COND FANS RESET FAULT light, on the maintenance panel, comes on.

The cold air valve will be fully closed, when :
- The COOLING selector is set to OFF, or
- The forward cargo smoke detection system is triggered, or
- The forward cooling system fails, or
- At least one pack is off.

HEATING

To provide variable temperature, inlet air is mixed with the hot air ducted upstream of PACK 1. The forward cargo trim air valve controls the quantity of hot air added.
The temperature is selected from the cockpit.

NORMAL OPERATION

When the HOT AIR 1 pushbutton (*Refer to DSC-21-10-50 Overhead Panel*) is switched ON, hot air is added to the cargo ventilation system. A trim air valve controls the quantity of hot air. The Ventilation Controller controls the position of this trim air valve, according to the sensed duct temperature and to the selected temperature. Manually switching the HOT AIR 1 pushbutton to OFF stops the heating.

Note: *If there is a failure in one of the hot air supplies, the hot air crossvalve opens. The forward cargo compartment supply remains, either through Channel 1 (Channel 2 failure), or through Channel 2 (Channel 1 failure).*

If the forward cargo compartment heating system is stopped via the HOT AIR 1 pushbutton, temperature control for the respective cabin zones (*Refer to DSC-21-10-50 Overhead Panel*) is also lost.

ON GROUND OPERATION

The trim air valve closes when the forward cargo door opens. Compartment heating is unavailable, as long as the cargo door remains open.

(1) ISOL VALVE pushbutton

On : The inlet and outlet isolation valves open, and the extraction fan runs. If smoke is detected in the cargo compartment, or DITCHING is selected, the valves close and the fan stops.

OFF : The inlet and outlet isolation valves close, and the extraction fan stops.

FAULT lt : The amber light and associated ECAM caution come on, when either inlet or outlet valve is not in the selected position.

(2) HOT AIR pushbutton

ON : The fan heater operates, provided the BULK cargo compartment temperature is below the selected one, and the BULK cargo door is closed.

OFF : The fan heater stops. Inlet air is not heated.

FAULT lt : The amber light, and associated ECAM message, come on when the duct overheats (above 88 °C/190 °F). The light goes off, when the temperature drops below 70 °C (158 °F), and OFF is selected. The fan heater stops.

(3) Temperature selector

COLD : 5 °C (41 °F)
HOT : 25 °C (79 °F)
Middle position : 15 °C (60 °F)

Note: *Cargo compartment temperature may vary due to such factors as flight duration, outside temperature, and cabin temperature. As a result, the actual temperature may be higher than the one indicated by the selector position.*

(4) Cargo COOLING selector

OFF : The cold air valve is closed. No cold air is added to the ventilation air.

NORM : The cold air valve is partially open for normal operation.

MAX : The cold air valve is fully open. Maximum quantity of cold air is supplied to cool the forward cargo compartment.

(5) Temperature selector

COLD : 5 °C (41 °F)
HOT : 25 °C (79 °F)
Middle position : 15 °C (60 °F)

(6) FWD PRESEL pushbutton

ACTIV lt : The light comes on green, when FWD PRESEL is set to ON, or the cargo compartment service panel's ON/OFF toggle is momentarily switched to ON. Once this toggle switch is ON, the temperature can be preselected on the forward cargo compartment service panel.

OFF : ACTIV light goes out. Temperature selection from the cockpit overrides the temperature preselected from the service panel.

Note: *The preselection system is automatically set to OFF, when the forward cargo door is opened after a flight.*

OVERHEAD MAINTENANCE PANEL

PREAMBLE

Ident.: DSC-22_10-10-00009929.0001001 / 18 AUG 10
Applicable to: ALL

This section gives a general description of the Auto Flight System and its functions:
- Architecture
- Function description
- Basic principle of systems:
  - Reversion
  - Protection
  - Managed and selected guidance modes.
- Mode information
- Display characteristics
- Operational principles
- Flight crew interface (MCDU pages)
- Degraded modes of operations.

DESCRIPTION

Ident.: DSC-22_10-10-00009933.0001001 / 18 AUG 10
Applicable to: ALL

The Flight Management Guidance and Envelope System (FMGES) contains the following units:
- Two Flight Management Guidance and Envelope Computers (FMGEC)
- Three Multipurpose Control and Display Units (MCDU)

- One Flight Control Unit (FCU)
- One Flight Management source selection device.

GENERAL PHILOSOPHY

Ident.: DSC-22_10-10-00009936.0001001 / 18 AUG 10
Applicable to: ALL

The Flight Management Guidance and Envelope System (FMGES) provides predictions of flight time, mileage, speed, economy profiles and altitude.
It reduces cockpit workload, improves efficiency, and eliminates many routine operations generally performed by the flight crew.

The Flight Management Guidance and Envelope System (FMGES) operates as follows:
- During cockpit preparation the flight crew uses the Multipurpose Control and Display Unit (MCDU) to insert a preplanned route from origin to destination. This route includes SID, EN ROUTE, WAYPOINTS, STAR, APPROACH, MISSED APPR, and ALTN route as available from the navigation database.
- Subsequently the system defines a vertical profile and a speed profile, taking into account ATC requirements and performance criteria.

Either FMGEC performs all operations, if one FMGEC fails.
The FMGES computes the aircraft position continually, using stored aircraft performance data and navigation data. Therefore it can steer the aircraft along a preplanned route and vertical and speed profiles. This type of guidance is said to be “managed”.
If the flight crew wants to modify any flight parameter (SPD, V/S, HDG, etc.) temporarily, they may do so by using the various Flight Control Unit (FCU) selectors. The FMGES then guides the aircraft to the target value of this parameter that they have selected. This type of guidance is said to be “selected”.

The two available types of guidance, then, are:
- Managed guidance guides the aircraft along the preplanned route and the vertical and speed/Mach profile (the FMGES computes the target values of the various flight parameters).
- Selected guidance guides the aircraft to the target values of the various flight parameters the flight crew selects by using the FCU selectors.

Selected guidance always has priority over managed guidance.

FLIGHT MANAGEMENT GUIDANCE AND ENVELOPE COMPUTER (FMGEC)

Ident.: DSC-22_10-10-00009937.0017001 / 05 MAR 19
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Each FMGEC is divided in four main parts:

- The Flight Management (FM) part controls the following functions:
  - Navigation and management of navigation radios
  - Flight planning and management
  - Performance prediction and optimization
  - Display management.
- The Flight Guidance (FG) part performs the following functions:
  - Autopilot (AP) command
  - Flight Director (FD) command
  - Autothrust (A/THR) command.
- The Flight Envelope (FE) part controls the following functions:
  - Computation of data for the flight envelope and speed functions
  - Monitoring of parameters used by FG and FE parts
  - Windshear and aft Center of Gravity (CG) detection
  - Computation of GW and CG information.
- The Fault Isolation and Detection System (FIDS) part performs the following functions:
  - Acquisition and concentration of maintenance data
  - Interface with the Central Maintenance Computer (CMC).

Each FMGEC has its own set of databases. The individual databases can be independently loaded into their respective FMGEC, or independently copied from one FMGEC to the other. Each FMGEC contains these main databases:

1. The Navigation database contains standard navigation data: Navaids, waypoints, airways, enroute information, holding patterns, airports, runways, procedures (SIDs, STARs, etc.), company routes, fuel policy, and alternates.
   The airline updates this part every 28 days, and is responsible for defining, acquiring, updating, loading, and using this data. The update operation takes 20 min to complete, or 5 min if crossloaded from the opposite FMGEC.
2. The Airline Modifiable Information (AMI), also decribed as the FM Airline Configuration file, contains:
   - Airline policy values: THR RED altitude, ACC altitude, EO ACC altitude, PERF factor, and IDLE factor.
   - Fuel policy values: Fuel for taxi, percentage of route reserve, maximum and minimum values of route reserve, etc.
   - AOC functions customization.
3. The Aircraft Performance Database includes the Engine model, Aerodynamic model, and Performance model. The airline cannot modify this database.

4. Each FMGEC contains element stored by the flight crew that enable them to generate 99 waypoints, 10 runways, 20 navaids and 5 routes.
5. The Magnetic Variation database.

FLIGHT MANAGEMENT GUIDANCE AND ENVELOPE COMPUTER (FMGEC)

Ident.: DSC-22_10-10-00009937.0003001 / 28 MAY 20
Applicable to: LV-GKO, LV-GKP

Each FMGEC is divided in four main parts:

- The Flight Management (FM) part controls the following functions:
  - Navigation and management of navigation radios
  - Flight planning and management
  - Performance prediction and optimization
  - Display management.
- The Flight Guidance (FG) part performs the following functions:
  - Autopilot (AP) command
  - Flight Director (FD) command
  - Autothrust (A/THR) command.
- The Flight Envelope (FE) part controls the following functions:
  - Computation of data for the flight envelope and speed functions
  - Monitoring of parameters used by FG and FE parts
  - Windshear and aft Center of Gravity (CG) detection
  - Computation of GW and CG information.
- The Fault Isolation and Detection System (FIDS) part performs the following functions:
  - Acquisition and concentration of maintenance data
  - Interface with the Central Maintenance Computer (CMC).

Each FMGEC has its own set of databases. The individual databases can be independently loaded into their respective FMGEC, or independently copied from one FMGEC to the other. Each FMGEC contains these main databases:

1. The Navigation database contains standard navigation data: Navaids, waypoints, airways, enroute information, holding patterns, airports, runways, procedures (SIDs, STARs, etc.), company routes, fuel policy, and alternates.

The airline updates this part every 28 days, and is responsible for defining, acquiring, updating, loading, and using this data. The update operation takes 20 min to complete, or 5 min if crossloaded from the opposite FMGEC.

2. The Airline Modifiable Information (AMI), also decribed as the FM Airline Configuration file, contains:
   - Airline policy values: THR RED altitude, ACC altitude, EO ACC altitude, PERF factor, and IDLE factor.
   - Fuel policy values: Fuel for taxi, percentage of route reserve, maximum and minimum values of route reserve, etc.
   - AOC functions customization.
3. The Aircraft Performance Database includes the Engine model, Aerodynamic model, and Performance model. The airline cannot modify this database.
4. Each FMGEC contains element stored by the flight crew that enable them to generate 20 waypoints, 10 runways, 20 navaids and 5 routes.
5. The Magnetic Variation database.

MULTIPURPOSE CONTROL AND DISPLAY UNIT (MCDU)

Ident.: DSC-22_10-10-00009938.0001001 / 18 AUG 10
Applicable to: ALL

Three MCDUs are installed on the pedestal for flight crew loading and the display of data.
The use of the MCDU enables the flight crew to interface with the FMGEC via selection of a flight plan for lateral and vertical trajectories and speed profiles. The flight crew may also modify selected navigation or performance data and specific functions of Flight Management (revised flight plan, engine-out, secondary flight plan, etc.). It is also possible to display additional data from peripherals (Centralized Maintenance System (CMS), ARINC Communication Addressing and Reporting System (ACARS), Air Traffic Service Unit (ATSU)...). If the flight crew enters data in the MCDU that is not logical, or is beyond the capabilities of the aircraft, it is disregarded or it generates an advisory message.
The MCDUs enable backup navigation in the case of dual FM failure.

FLIGHT CONTROL UNIT (FCU)

Ident.: DSC-22_10-10-00009939.0001001 / 18 AUG 10
Applicable to: ALL

The FCU on the glareshield is the short-term interface between the flight crew and the FMGEC. The flight crew uses it to select any flight parameters, or to modify those selected on the MCDU. It is possible to engage or disengage autopilots and autothrust functions. It is possible to select different guidance modes in order to change various targets (speed, heading, track, altitude, flight path angle, vertical speed).

FM SOURCE SELECTOR

Ident.: DSC-22_10-10-00009940.0001001 / 18 AUG 10
Applicable to: ALL

This selector enables the flight crew to transfer the FMGEC data to the offside MCDU and EFIS display in the case of an FM failure.

OTHER FLIGHT CREW INTERFACES

Ident.: DSC-22_10-10-A-00009941.0001001 / 18 AUG 10
Applicable to: ALL

THRUST LEVERS

The thrust levers are the main interface between the Flight Management Guidance and Envelope Computer (FMGEC), the Full Authority Digital Engine Control System (FADEC), and the flight crew.

The thrust levers:
- Arm the autothrust at takeoff, when the flight crew selects FLX or TOGA
- Limit the maximum thrust by their position when autothrust is active
- Disconnect the autothrust system when the flight crew sets them to IDLE
- Command the thrust manually when the autothrust is not active
- Engage the common modes (takeoff or go-around) when the flight crew selects TOGA (or FLX for takeoff)
- Set the autothrust to ACTIVE mode, when they are between IDLE and CL detent (MCT in engine out).

Ident.: DSC-22_10-10-A-00009942.0001001 / 18 AUG 10
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

ELECTRONIC FLIGHT INSTRUMENTS (EFIS)

Two Primary Flight Displays (PFD) and Navigation Displays (ND) provide the flight crew with full-time flight guidance, navigation and system advisory information for all flight phases. There is an EFIS control panel at each end of the glareshield and it is used to control both Primary and Navigation Displays. This panel includes controls to select various modes within the PFD. A selector enables the barometric altimeter setting to be displayed on the PFD. It is possible to select various distance ranges on the ND, and two switches enable the display of either the left or right VOR/ADF bearing pointers on the ND.

Ident.: DSC-22_10-10-A-00009942.0003001 / 18 AUG 10
Applicable to: LV-KHT, LV-KHU

ELECTRONIC FLIGHT INSTRUMENTS (EFIS)

Two Primary Flight Displays (PFD) and Navigation Displays (ND) provide the flight crew with full-time flight guidance, navigation and system advisory information for all flight phases. There is an EFIS control panel at each end of the glareshield and it is used to control both Primary and Navigation Displays. This panel includes controls to select various modes within the PFD. A selector enables the barometric altimeter setting to be displayed on the PFD. It is possible to select various distance ranges on the ND, and two switches enable the display of either the left or right VOR bearing pointers on the ND.

Ident.: DSC-22_10-10-A-00009943.0001001 / 18 AUG 10
Applicable to: ALL

PRIMARY FLIGHT DISPLAYS

The PFDs combine several conventional flight instrument indications on one color display panel, for the centralized reference of flight data.

This centralized color display includes:
- Flight Director attitude guidance targets
- Armed and engaged modes
- Navigation and instrument approach information
- Altimeter setting
- Barometric altitude
- System messages.

Ident.: DSC-22_10-10-A-00009944.0001001 / 18 AUG 10
Applicable to: ALL

NAVIGATION DISPLAYS

The flight crew can select five different navigation compass displays:
- ARC (map mode)
- ROSE NAV (map mode)
- ROSE VOR
- ROSE LS
- PLAN.

Information displayed on these modes uses the position of the aircraft as a reference point for the flight plan navigation data (lateral and vertical information).

FAULT ISOLATION AND DETECTION SYSTEM

Ident.: DSC-22_10-10-00001408.0001001 / 05 APR 11
Applicable to: ALL

The Fault Isolation and Detection System (FIDS) is installed in FMGC 1. The system achieves the following functions :

- Detection and memorization of all internal and external failures
- Tests initiation

The FIDS serves as the system BITE (maintenance data concentration).
It is connected to the BITE's of the various AFS computers (FM, FG, FE, FCU, MCDU) and linked to the CMS.
Display and interrogation of FIDS function are done by selecting appropriate key on the MCDU page.

GENERAL

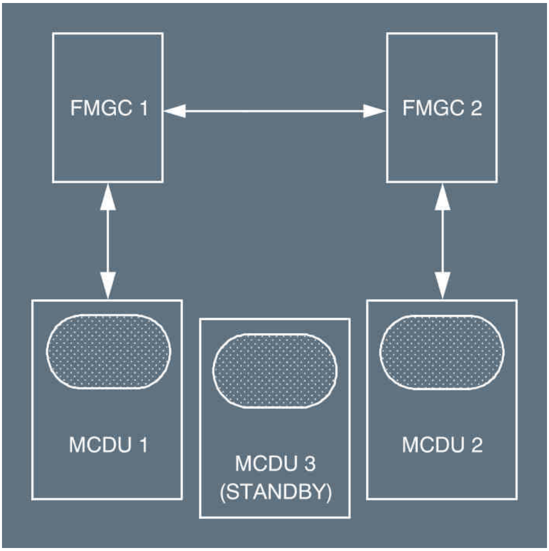
Ident.: DSC-22_10-30-00009947.0001001 / 18 AUG 10
Applicable to: ALL

The FMGES has four modes of operation:
- Dual mode (the normal mode)
- Independent mode. Each FMGEC being controlled by its associated MCDU
- Single mode (using one FMGEC only)
- Back-up navigation mode.

DUAL MODE

Ident.: DSC-22_10-30-00009948.0001001 / 19 DEC 12
Applicable to: ALL

This is the normal mode. The two FMGECs are synchronized: each performs its own computations and exchanges data with the other through a crosstalk bus.
One FMGEC is the master, the other the slave, so that some data in the slave FMGEC comes from the master.
All data inserted into any MCDU is transferred to both FMGECs and to all peripherals.

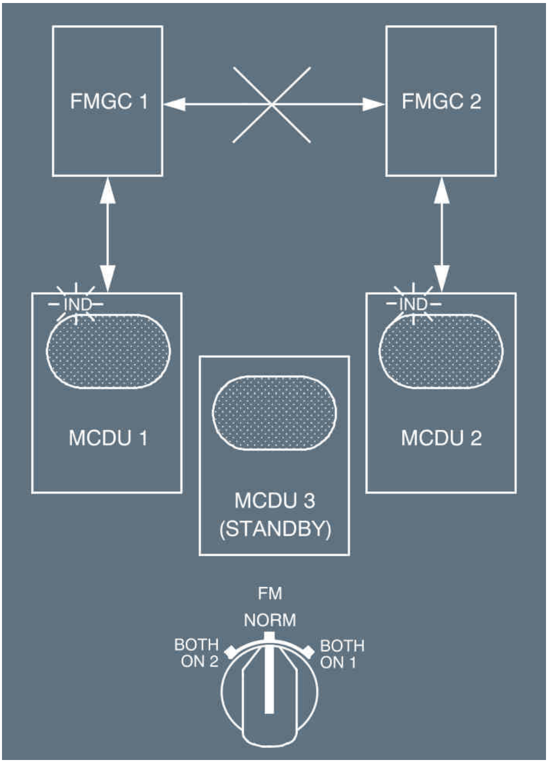


MASTER FMGEC LOGIC:

- If one autopilot (AP) is engaged, the related FMGEC is master:
  - It uses the onside FD for guidance
  - It controls the A/THR
  - It controls the FMA 1 and 2
- If two APs are engaged, FMGEC1 is master.
- If no AP is engaged and
  - The FD1 pb is on, then FMGEC1 is master.
  - The FD1 pb is off, and FD2 pb on then FMGEC2 is master.
- If no AP/FD is engaged, A/THR is controlled by FMGEC1.

INDEPENDENT MODE

Ident.: DSC-22_10-30-00009953.0003001 / 19 DEC 12
Applicable to: ALL



FMGC 1
FMGC 2
IND
IND
MCDU 1
MCDU 2
MCDU 3
(STANDBY)
FM
NORM
BOTH
ON 2
BOTH
ON 1

The system selects automatically this degraded mode under specific abnormal conditions (e.g. different database validity on both FMGECs). Each FMGEC works independently from the other and is linked to the peripherals on its owner side (“on side” peripheral) only.
While this is occuring, “INDEPENDENT OPERATION” message is displayed on both MCDUs scratchpads. The "IND" annunciator light illuminates amber on the top of the MCDU.
Each MCDU transmits data received from its onside FMGEC. It affects only the onside EFIS (Electronic Flight Instrument System) and RMP (Radio Management Panel).
On POS MONITOR pages and GPS MONITOR pages, FM and GPS position from the opposite FMGEC are not displayed.
On RAD NAV page and PROG page, navaids tuned on the opposite MCDU are not displayed. Corresponding fields are blank.

PROCEDURES ON GROUND

- **If each FMGEC is loaded with a different database,** the FMGES will only operate in independent mode only.

  CHECK the database number and validity.

  CROSSLOAD the database to restore the dual operation.

  Crossload function is available on ground only (in preflight or done phase), when an independent operation is detected.

PROCEDURES IN FLIGHT

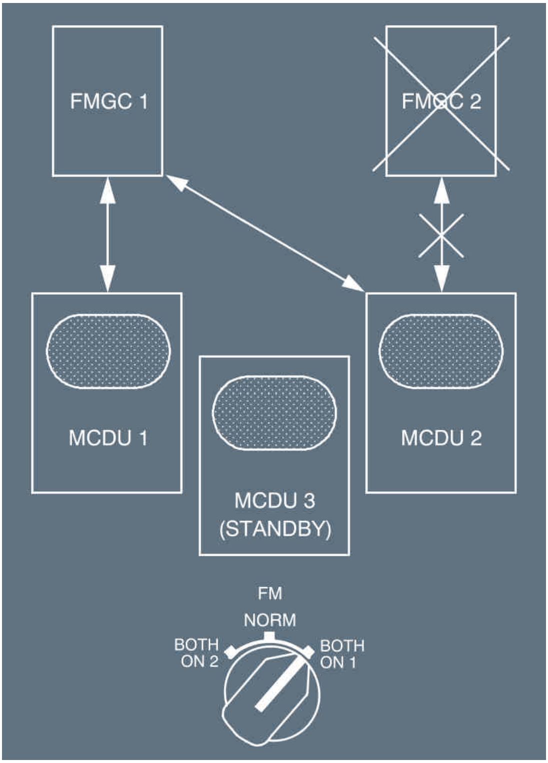
DO NOT SWITCH the navigation databases.
MAKE the same entries on both MCDUs to have both AP/FD similar orders.

Both FGs being valid, 2 APs may be engaged for CAT II or CAT III operations.

- **In the event of a go around and when the second AP is disconnected:**
  ENSURE that the FMGEC in command has correct flight plan orders and an updated nav database.

SINGLE MODE

Ident.: DSC-22_10-30-00009955.0001001 / 19 DEC 12
Applicable to: ALL



The system degrades to the single mode when one FMGEC has failed, and the flight crew has selected the FM source selector to the healthy FM.

While this is occurring:
- Corresponding ND displays "OFFSIDE FM CONTROL" amber message
- Both POS MONITOR pages display the same position (operative FMGEC position)
- Both FDs are driven by the same FMGEC
- Any entry on either MCDU is sent to the operative FMGEC.

PROCEDURES

- **If a transient failure triggers a single mode of operation:**

  DO NOT USE the MCDU(s) until the PLEASE WAIT message is suppressed.

  SET both NDs on the same range and mode to display the same information from the operative FMGEC.

  When convenient, RESET the failed FMGEC. (*Refer to DSC-22_20-90-10 Manual FMGEC Reset*).

BACK UP NAVIGATION MODE

Ident.: DSC-22_10-30-00009956.0001001 / 19 DEC 12
Applicable to: ALL

BACK UP
NAV
MCDU 2
BACK UP
NAV
FM
NORM
BOTH
ON 2
BOTH
ON 1

The flight crew selects on the MCDU MENU page this degraded mode when both FMGECs have failed. They recover the navigation function through the MCDU and IRS.

The MCDU continuously memorizes the active flight plan, which was continuously downloaded from the FMGEC until it failed.

If both FMGECs fail, the back up navigation provides the following functions:
- Flight Planning
- Aircraft position using onside IRS or IRS 3
- F-PLN display on ND
- No AP/FD NAV mode
- Limited lateral revision
- F-PLN automatic sequencing.

Note: *MCDU 3 is not able to operate as back up navigation even when it replaces MCDU 1 or 2. The back up navigation mode is only accessible on the MCDU MENU page if the FM source selector is set to NORM position.*

GENERAL

Ident.: DSC-22_10-40-05-00009925.0001001 / 18 AUG 10
Applicable to: ALL

The flight management system displays navigation, performance and guidance information on the:
- Multipurpose Control and Display Unit (MCDU)
- Navigation Display (ND) of the Electronic Flight Instrument System (EFIS)
- Primary Flight Display (PFD) of the EFIS.

Intentionally left blank

Applicable to: LV-GKO, LV-GKP

GENERAL

The Multipurpose Control and Display Unit (MCDU) is a cathode ray tube that generates 14 lines, of 24 characters each, with:

- A title that provides the name of the current page in large letters
- Six label lines: Each one describes the data displayed slightly below it (on the data field line)

- Six data field lines that display computed data or data inserted by the flight crew
- The scratchpad line displays:
  - Specific messages
  - Information that the flight crew enters via the number and the letter keys and that they can then move to one of the data fields.

Ident.: DSC-22_10-40-10-A-00009958.0003001 / 18 AUG 10
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

GENERAL

The Multipurpose Control and Display Unit (MCDU) is a Liquid Crystal Display (LCD) with 14 lines, of 24 characters each, with:

- A title that provides the name of the current page in large letters
- Six label lines: Each one describes the data displayed slightly below it (on the data field line)
- Six data field lines that display computed data or data inserted by the flight crew
- The scratchpad line displays:
  - Specific messages
  - Information that the flight crew enters via the number and the letter keys and that they can then move to one of the data fields.

Ident.: DSC-22_10-40-10-A-00009959.0001001 / 18 AUG 10
Applicable to: ALL

LINE SELECT KEYS

There is a column of line select keys (LSKs) on each side of the screen.

The flight crew uses these keys to:

- Move a parameter they have entered in the scratchpad to the appropriate line on the main screen
- Call up a specific function page indicated by a prompt displayed on the adjacent line
- Call up lateral or vertical revision pages from the flight plan page.

Ident.: DSC-22_10-40-10-A-00009960.0001001 / 18 AUG 10
Applicable to: ALL

KEYBOARD

The keyboard includes:

- Function and Page keys — Call up functions and pages the flight crew uses for flight management functions and computations.

↑ ↓ (or SLEW) keys	Move a page up or down to display portions that are off the screen.
← → keys	Move to the next or previous page of a multi-page element. An arrow in the top right corner indicates that another page is available.
AIRPORT key	Calls up the flight plan page that contains the next airport along the current flight plan. Successive pushes on the key show the alternate airport, the origin airport (before takeoff), and the next airport again.

- Number and letter keys allow the flight crew to insert data in the scratchpad so that they can use a line select key to enter it in the main display.
- Three keys have special functions:

CLR (clear) key	Erases material (messages or inserted data) from the scratchpad or from certain areas of displayed pages.
OVFY (overfly) key	Allows the aircraft to overfly a selected waypoint.
SP (space) key	Allows to insert a space in specific messages.

Ident.: DSC-22_10-40-10-A-00009961.0001001 / 18 AUG 10
Applicable to: ALL

ANNUNCIATORS (ON THE SIDE OF THE KEYBOARD)

FAIL (amber)	Indicates that the Multipurpose Control and Display Unit (MCDU) has failed.
MCDU MENU (white)	Indicates that the flight crew should call up a peripheral linked to the MCDU (such as ACARS, ATSU or CMS).
FM (white)	Comes on while the flight crew is using the MCDU to display peripherals. This light tells the flight crew that the FMGEC has an important message to deliver. The flight crew accesses the message by pressing the MCDU MENU key and the line select key adjacent to the FMGEC prompt.

Ident.: DSC-22_10-40-10-A-00009968.0001001 / 18 AUG 10
Applicable to: LV-GKO, LV-GKP

ANNUNCIATORS (ON THE TOP OF THE KEYBOARD)

FM 1 and FM 2 (amber)	The onside FM is failed *Note:* - *The FM failure annunciator on MCDU 3 comes on only if MCDU 3 operates as a back up of MCDU 1 or 2* - *A MCDU has never both FM failure annunciators ON.*
IND (amber)	The onside FM detects an independent mode of operation while both FM are healthy.
RDY (green)	MCDU has passed its power up test after its BRT knob was turned to OFF.

Ident.: DSC-22_10-40-10-A-00009968.0005001 / 18 AUG 10
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

ANNUNCIATORS (ON THE TOP OF THE KEYBOARD)

FM 1 and FM 2 (amber)	The onside FM is failed *Note:* - *The FM failure annunciator on MCDU 3 comes on only if MCDU 3 operates as a back up of MCDU 1 or 2* - *A MCDU has never both FM failure annunciators ON.*
IND (amber)	The onside FM detects an independent mode of operation while both FM are healthy.
RDY (green)	MCDU has passed its power up test after it was turned to OFF using its DIM key.

Ident.: DSC-22_10-40-10-A-00009969.0001001 / 18 AUG 10
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

BRT AND DIM KEYS

The flight crew can adjust the brightness of the MCDU with the BRT and DIM keys.
In addition, the BRT key is used to power up the MCDU, and the DIM key is used to shut down the MCDU.

Note: *In case of MCDU 1 or 2 failure, its DIM key has to be switched off to allow the MCDU 3 connection to the corresponding FMGEC.*

Ident.: DSC-22_10-40-10-A-00009970.0001001 / 17 MAR 17
Applicable to: LV-GKO, LV-GKP

BRT knob

Controls the light intensity of the entire MCDU and is used to shut down the MCDU when set to off.

Note: *In case of MCDU 1 or 2 failure, its BRT knob has to be switched off to allow the MCDU 3 connection to the corresponding FMGEC.*

Ident.: DSC-22_10-40-10-A-00009971.0001001 / 18 AUG 10
Applicable to: ALL

DATA ENTRY

The flight crew enters data by typing it into the scratchpad on the MCDU. Next, pressing the line select key (LSK) will load the data from the scratchpad into the desired field. An error message displays if the data are out of range or not formatted correctly. To correct data, the flight crew may clear the message with the clear (CLR) key and then retype the message into the scratchpad. Pressing the CLR key when the scratchpad is empty displays “CLR”. To clear data from a field, select CLR from the scratchpad to the data field to be cleared.

Ident.: DSC-22_10-40-10-A-00009972.0001001 / 18 AUG 10
Applicable to: ALL

MCDU ENTRY FORMAT

The flight crew enters information into the MCDU at the bottom line of the scratchpad. When data has lead zeros, they may be omitted if desired. For example a three-digit wind direction of 060 may be typed as 60. The display will still show 060. To enter an altitude below 1 000 ft, the lead zero must be added as 0400 for 400 ft. This differentiates the altitude from a flight level.
To enter a double data entry such a speed/altitude, the separating slash must be used. If entering only the first part of a double entry, omit the slash. To enter only the second part of a double entry, a leading slash must be used i.e. /0400.

Ident.: DSC-22_10-40-10-A-00009973.0001001 / 18 AUG 10
Applicable to: ALL

MESSAGES

The scratchpad displays various messages for flight crew information. Theses messages are prioritized by importance to the flight crew as either amber or white.

Amber messages are:
- Navigation messages
- Data entry messagesh
- EFIS repeat messages.

Amber messages are categorized into two types:

- Type 1 message that is a direct result of a flight crew action. Type 1 messages are displayed immediately in the scratchpad ahead of other messages.
- Type 2 messages inform the flight crew of a given situation or request a specific action. Stored in “last in”, “first out” message queue that holds maximum of 5 messages.
  Type 2 messages are displayed in the scratchpad only if there are no Type 1 messages or other data and will remain until all the messages have been viewed and cleared with the CLR key.

White messages are advisory only.

Ident.: DSC-22_10-40-10-A-00009974.0001001 / 18 AUG 10
Applicable to: ALL

CHARACTERS

Small and large fonts are displayed according to the following rules:

- The title line and the scratchpad are displayed in large font
- Datafields are usually displayed in large font
- Label lines are displayed in small font
- Flight crew entries and modifiable data are displayed in large font
- Defaulted/computed and non modifiable data are displayed in small font.

MCDU FUNCTION KEYS

The Multipurpose Control and Display Unit function keys enable the flight crew to quickly call up MCDU pages.
The following summarizes the purpose of each key:

DIR	Calls up the DIR TO page and enables the flight crew to proceed directly from the present position to any waypoint entered manually or selected in the active flight plan.
PROG	Calls up the progress page corresponding to the phase of the active flight plan that is in progress. This page displays navigation information and active data such as the optimum and maximum recommended cruise flight levels. It allows the flight crew to update the FMGES position, and to get a bearing and distance to any location.
PERF	Calls up the performance pages, which display the optimum speed or Mach number for each phase. The flight crew can amend these pages. The first page to be displayed is the one corresponding to the current flight phase (except for preflight and done phases). The flight crew can then use the appropriate 6L or 6R key to call up pages corresponding to future flight phases.

INIT	Calls up the flight plan initialization page (INIT A), which also gives access to the INIT FUEL PRED page and IRS INIT page. The flight crew uses the INIT pages to initialize flight management for the flight. The flight crew primarily uses the INIT A page to insert the flight plan. The flight crew uses the IRS INIT page to align the inertial reference system. The flight crew uses the INIT FUEL PRED page to insert aircraft weight, FOB, CG and other fuel requirements. The FMGES uses this data to compute predictions and fuel planning parameters. The flight crew can access the INIT A page, for flight plan initialization, only in the preflight phase. In flight, they can only modify the alternate flight plan. IRS INIT page is accessed via the "IRS INIT" prompt on the INIT A page. In the flight phase, it is only accessible for information purposes. The INIT FUEL PRED page (not accessible after engine start) is called up by pressing the "→" (NEXT PAGE) key.
DATA	Calls up the DATA INDEX page. This provides the flight crew access to various reference pages that display aircraft position, aircraft status, runways, waypoints, NAVAIDs, routes and data stored by the flight crew.
F-PLN	Calls up the flight plan A and B pages, that contain a leg-by-leg description of the active primary flight plan. The flight crew can use the scroll keys to review the entire active flight plan. They can make all lateral and vertical revisions to the flight plan via these pages, by using the left keys for lateral revision and the right keys for vertical revision.
RAD NAV	Calls up the RADIO NAV page. This page displays the radio NAVAIDs that are tuned automatically or manually via the FMGEC.
FUEL PRED	Calls up the fuel prediction page. When the engines start, this page displays the predicted remaining fuel at the destination and the alternate, and fuel management data.
SEC F-PLN	Calls up the index page for the secondary flight plan. The flight crew can use this page to call up the secondary flight plan and all the functions related to it (copying, deleting, reviewing, activating, and the INIT and PERF pages).
ATC COMM	Calls up the ATC applications (if activated).
MCDU MENU	Calls up the MCDU MENU page, that displays the subsystems currently addressed via the MCDU. The key next to the name of a subsystem enables the flight crew to select that subsystem. When the MCDU MENU annunciator lights up, the flight crew should press the MCDU MENU key. The menu displays [REQ] next to the name of the subsystem that requires attention.

AIRPORT	Calls up the flight plan page that includes the next airport along the current flight plan. The first push of the AIRPORT key displays the destination. Successive pushes show the alternate, the origin, and the destination again.

Ident.: DSC-22_10-40-10-A-00009977.0011001 / 18 AUG 10

Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

MCDU FUNCTION KEYS

The Multipurpose Control and Display Unit function keys enable the flight crew to quickly call up MCDU pages.
The following summarizes the purpose of each key:

DIR	Calls up the DIR TO page and enables the flight crew to proceed directly from the present position to any waypoint entered manually or selected in the active flight plan.
PROG	Calls up the progress page corresponding to the phase of the active flight plan that is in progress. This page displays navigation information and active data such as the optimum and maximum recommended cruise flight levels. It allows the flight crew to update the FMGES position, and to get a bearing and distance to any location.
PERF	Calls up the performance pages, which display the optimum speed or Mach number for each phase. The flight crew can amend these pages. The first page to be displayed is the one corresponding to the current flight phase (except for preflight and done phases). The flight crew can then use the appropriate 6L or 6R key to call up pages corresponding to future flight phases.
INIT	Calls up the flight plan initialization (INIT) A page, which also gives access to the B page and IRS INIT page. The flight crew uses the INIT pages to initialize Flight Management for the flight. The flight crew primarily uses the INIT A page to insert the flight plan. The flight crew uses the IRS INIT page to align the inertial reference system. The flight crew uses the INIT B page to insert aircraft weight, Fuel on Board, CG, and other fuel requirements. The FMGES uses this data to compute predictions and fuel planning parameters. The flight crew can access the INIT A page, for Flight Plan initialization, only in the preflight phase. In flight, they can only modify the Alternate Flight Plan. IRS INIT page is accessed via the "IRS INIT" prompt on the INIT A page. In the flight phase, it is only accessible for information purposes. The INIT B page (not accessible after engine start) is called up by pressing the “← →” (NEXT PAGE) key.

DATA	Calls up the data index page. This provides the flight crew access to various reference pages that display aircraft position, aircraft status, runways, waypoints, navaids, routes and data stored by the flight crew.
F-PLN	Calls up the flight plan A and B pages, that contain a leg-by-leg description of the active primary flight plan. The flight crew can use the scroll keys to review the entire active flight plan. They can make all lateral and vertical revisions to the flight plan via these pages, by using the left keys for lateral revision and the right keys for vertical revision.
RAD NAV	Calls up the RADIO NAV page. This page displays the radio navaids that are tuned automatically or manually via the FMGEC.
FUEL PRED	Calls up the fuel prediction page. When the engines start, this page displays the predicted remaining fuel at the destination and the alternate, and fuel management data.
SEC F-PLN	Calls up the index page for the secondary flight plan. The flight crew can use this page to call up the secondary flight plan and all the functions related to it (copying, deleting, reviewing, activating, and the INIT and PERF pages).
ATC COMM	Calls up the ATC applications (if activated).
MCDU MENU	Calls up the MCDU MENU page, that displays the subsystems currently addressed via the MCDU. The key next to the name of a subsystem enables the flight crew to select that subsystem. When the MCDU MENU annunciator lights up, the flight crew should press the MCDU MENU key. The menu displays [REQ] next to the name of the subsystem that requires attention.
AIRPORT	Calls up the flight plan page that includes the next airport along the current flight plan. The first push of the AIRPORT key displays the destination. Successive pushes show the alternate, the origin, and the destination again.

MCDU DISPLAY

The MCDUs display:
- Position and accuracy information
- Tuned navaids
- Lateral and vertical flight plans (waypoints, pseudo waypoints, constraints)
- Predictions (SPD, TIME, ALT, WIND)
- Fuel predictions and fuel management information (estimated fuel on board, extra fuel)
- Performance data.

FCU

Ident.: DSC-22_10-40-20-00010437.0002001 / 01 OCT 12
Applicable to: ALL

The Flight Control Unit (FCU) is located on the glareshield and is constituted of three control panels: One for the automatic flight controls and two for the Electronic Flight Instrument System (EFIS).
The FCU has two channels, each of which can independently command the central panel. If one channel fails, the other channel can control all the functions.

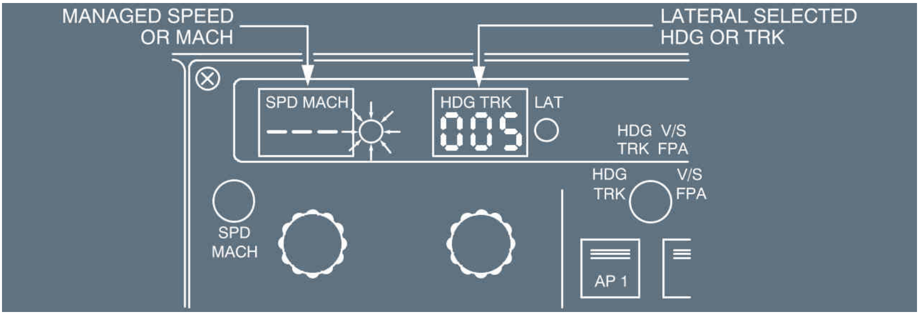
FCU PHILOSOPHY

Ident.: DSC-22_10-40-20-00010438.0001001 / 01 OCT 12
Applicable to: ALL

The flight crew can use two types of guidance to control the aircraft in auto flight. The Flight Management Guidance and Envelope System (FMGES) manages one type. The other uses target quantities, manually entered by the flight crew.
When the aircraft uses target quantities from the FMGES (managed guidance), the FCU windows display dashes and the white dots next to those windows light up. When the aircraft uses target quantities that the flight crew enters (selected guidance), the windows display the selected numbers and the white dots do not light up.



Note: *The altitude window always displays an altitude that the flight crew selects (never dashes).*

The FCU has four knobs:
- SPD-MACH
- HDG-TRK
- ALT
- V/S-FPA.

It is possible to rotate, push in and pull-out the knobs:
- In order to arm or engage managed guidance for a mode, the flight crew pushes in the associated knob. If, for example, they push in the HDG knob, this engages or arms the NAV mode.
- In order to engage a selected guidance mode, the flight crew turns the knob to set the desired value, then pulls the knob out to engage the mode with its target value that is equal to the selected value.

Note: *In managed guidance (lateral, vertical guidance or managed speed), the corresponding window is dashed. If the flight crew turns and does not pull a knob, it displays a value that is the sum of the current target and the turn action value. The value remains displayed 45 s before the dashes reappear. This rule does not apply to the ALT knob/window.*

LOC pb

Press this pushbutton to arm, engage, or disengage the LOC mode.

HDG V/S - TRK FPA pb

The flight crew uses this pushbutton to select HDG (associated with V/S) or TRK (associated with FPA). Pushing it:

- Displays the Flight Path Vector (FPV) on the Primary Flight Display (PFD) or deletes it.
- On the PFD, changes the FD crossbar display (with the aircraft attitude as its reference) to the aircraft Flight Path Director (with the flight path vector as its reference) and vice versa.
- Changes heading reference into track reference in the HDG/TRK window and vice versa.
- Changes vertical speed reference target into flight path angle reference target in the V/S-FPA window and vice versa.

Altitude Selector Knob
Mode Engagement
V/S or FPA Selector Knob

The FCU altitude window always displays a target value selected by the flight crew. It never displays dashes.

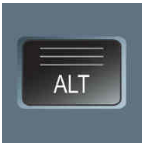
ALTITUDE Selector knob

When turned, sets the target altitude in the FCU window.

Display range: 100 to 49 000 ft
- The outer knob has two positions: 100 and 1000
- The inner knob sets the altitude in the FCU window, in increments of 100 or 1 000 ft, depending on the position of the outer knob.

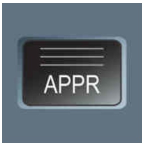
MODE ENGAGEMENT

ALT pb



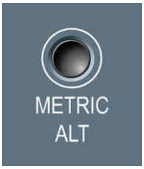
When pushed, commands an immediate level-off.

APPR pb



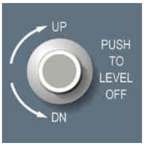
When pushed, arms, disarms, engages, or disengages the approach modes:
- LOC and G/S modes if an ILS/GLS ◁ approach is selected in the active F-PLN
- APP NAV-FINAL modes, if a non precision approach is selected in the active F-PLN.

PFD METER Selector pb



Displays the target altitude (either the FCU-selected altitude, or the FM altitude constraint) and the current altitude in meters on the PFD.

V/S or FPA Selector knob



When turned, if in V/S or FPA mode, selects a vertical speed or flight path angle target. If not in V/S or FPA mode (V/S / FPA window is dashed), preselects a vertical speed or flight path angle target. When the V/S or FPA mode engages (flight crew action or mode reversion), this preselected value becomes the target.
A push on the HDG V/S - TRK FPA pb allows to change the display between V/S or FPA.

Note: *If the V/S or FPA mode is not engaged within 45 s after preselection, the preselected value is cancelled and the dashes reappear.*

Range (V/S) : – 6 000 to + 6 000 ft/min
2 clicks = 100 ft/min
If the flight crew turns the knob slowly, each click equals 100 ft/min

Range (FPA)	:	– 9.9 ° to + 9.9 ° 1 click = 0.1 °

One rotation of the knob corresponds to 32 clicks. One complete rotation sets:
FPA = 3.2 °
V/S = 1 600 ft/min

When the flight crew pushes the V/S knob or FPA knob, the system commands an immediate level-off by engaging the V/S or FPA mode with a target of zero. If the flight crew then turns the knob to set a new value for V/S or FPA, the aircraft changes flight path accordingly.

This section shows the symbology and definition of speeds.
Source of computation is also given when applicable.

Intentionally left blank

CHARACTERISTIC SPEEDS

Ident.: DSC-22_10-50-20-00020243.0001001 / 03 DEC 19
Applicable to: ALL

The characteristic speeds displayed on the PFD are computed by the FE (Flight Envelope). VLS (of normal landing configuration: CONF 3 or FULL), F, S and Green Dot speeds are also displayed on the MCDU TAKEOFF and/or APPR, GO AROUND pages.
These values are computed by the FMGC.
Computations made by FE and FMGC are based on the gross weight information transmitted by the FCMC (Fuel Control and Monitoring Computer).

VS : Stalling speed.
Not displayed.
For a conventional aircraft, the reference stall speed, VSmin, is based on a load factor that is less than 1 g. This gives a stall speed that is lower than the stall speed at 1 g. All operating speeds are expressed as functions of this speed. (For example, VREF = 1.3 VSmin).
Because the A330 has a low-speed protection feature (alpha limit) that the flight crew cannot override, the airworthiness authorities have reconsidered the definition of stall speed for this aircraft.
All the operating speeds must be referenced to a speed that can be demonstrated by flight test. This speed is designated VS1 g.

Airworthiness authorities have agreed that a factor of 0.94 represents the relationship between VS1 g for A330 and VSmin for conventional aircraft types.
As a result the authorities allow the A330 to use the following factors:
V2 min = 1.2 × 0.94 VS1 g = 1.13 VS1 g
VREF = 1.3 × 0.94 VS1 g = 1.23 VS1 g

These speeds are identical to those that the conventional 94 % rule would have defined for this aircraft. The A330 has exactly the same maneuver margin that a conventional aircraft would have at its reference speeds.
The FCOM uses VS for VS1 g.

VLS : Lowest Selectable speed.

Represented by the top of an amber strip along the airspeed scale on the PFD.

It is equal to:
- 1.13 VS, at takeoff
- 1.18 VS, when the flaps are retracted
- 1.23 VS, when in clean configuration. (It remains at this value until landing).

VLS is corrected for Mach effect to maintain a 0.3 g buffet margin.
In addition, VLS is increased when the speedbrakes are extended.

The VMCG/VMCA/VMCL is taken into account for VLS computation as follows:
- At takeoff, until retraction of one step of flaps, VLS is equal to or greater than the lowest of:
  - V2/1.05, or
  - 1.05 VMCA maximum certified.
- In all the other phases, it is equal to or greater than VMCL.

F :
- At takeoff or go-around: F is the minimum recommended speed at which the flaps may be retracted from CONF 3 to CONF 1+F or from CONF 2 to CONF 1+F.
- During approach: F is the target speed, when the aircraft configuration is CONF 2 or CONF 3.

Represented by “F” on the PFD airspeed scale.
At takeoff, it is equal to about 1.18 VS of CONF 1 + F, and is limited to a minimum of VMCL + 5 kt.
In approach, when the aircraft is in CONF 2, the takeoff value is increased by 14 %. It is limited to a minimum of VMCL + 15 kt and to a maximum of VFE CONF 3 – 2 kt.
Then, when the aircraft is in CONF 3, the takeoff value is increased by 4 %. It is limited to a minimum of VMCL +10 kt and to a maximum of VFE CONF FULL – 2 kt.

S :
- At takeoff or go-around: S is the minimum recommended speed at which the slats may be retracted from CONF 1+F to CONF 0 or from CONF 1 to CONF 0.
- During approach: S is the target speed, when the aircraft configuration is CONF 1.

Represented by “S” on the PFD airspeed scale.
Equal to 1.21 VS of clean configuration.
In approach, S is limited to a maximum of VFE CONF 1* - 2 kt.

0 : Green dot speed.
Engine-out operating speed in clean configuration.
(Best lift-to-drag ratio speed).
Corresponds also to the final takeoff speed.
Represented by a green dot on the PFD scale.

With all engines running:
- Below 20 000 ft equal to 0.6 × weight (metric tons) +107 kt
- Above 20 000 ft, add 1 kt per 1 000 ft

With at least one engine-out, subtract 10 kt, in the above situations.

Intentionally left blank

LIMIT SPEEDS

Ident.: DSC-22_10-50-30-00020244.0001001 / 17 MAR 17
Applicable to: ALL

VA : Maximum design maneuvering speed. This corresponds to the maximum structural speed permitted for full control deflection, if alternate or direct law is active.

VMCG : Minimum speed, on the ground during takeoff, at which the aircraft can be controlled by the use of primary flight controls only, after a sudden failure of the critical engine, the other engines remaining at takeoff power.

VMCA : Minimum control speed in flight at which the aircraft can be controlled with a maximum bank of 5 °, if one engine fails, the other engine remaining at takeoff power (takeoff flap setting, gear retracted).

VMCL : Minimum control speed in flight at which the aircraft can be controlled with a maximum bank of 5 °, if one engine fails, the other engine remaining at takeoff power (approach flap setting).

VFE : Maximum speed for each flap configuration.

VLE : Maximum speed with landing gear extended.

VLO : Maximum speed for landing gear operation.

VMO : Maximum speed.

VFE NEXT: Maximum speed for the next (further extended) flap lever position.

Intentionally left blank

PROTECTION SPEEDS

Ident.: DSC-22_10-50-40-00020245.0001001 / 17 MAR 17
Applicable to: ALL

Vα PROT, Vα MAX and VSW are computed by the PRIM, based on aerodynamic data.

Vα PROT:	Angle-of-attack protection speed. Corresponds to the angle-of-attack at which the angle-of-attack protection becomes active. Represented by the top of a black and amber strip along the PFD speed scale, in normal law.
Vα MAX :	Maximum angle-of-attack speed. Corresponds to the maximum angle-of-attack that may be reached in pitch normal law. Represented by the top of a red strip along the PFD speed scale, in normal law.
VSW :	Stall warning speed. Represented by a red and black strip along the speed scale when the flight control normal law is inoperative.
VMAX :	Represented by the bottom of a red and black strip along the speed scale. Determined by the FE according to the aircraft configuration. It is equal to VMO (or speed corresponding to MMO), VLE or VFE.

Intentionally left blank

OTHER SPEEDS

Ident.: DSC-22_10-50-50-00020246.0001001 / 05 DEC 17
Applicable to: ALL

V1 : The highest speed, during takeoff, at which the flight crew has a choice between continuing the takeoff or stopping the aircraft.
Represented by “1” on the airspeed scale (or the V1 value when it is off the airspeed scale).
Inserted manually through the MCDU by the crew.
Displayed on the MCDU TAKEOFF page.

VR : The speed at which the pilot rotates in order to reach V2 at an altitude of 35 ft at the latest after an engine failure.
Inserted manually through the MCDU by the crew.
Displayed on the MCDU TAKEOFF page.

V2 : Takeoff safety speed that the aircraft attains at the latest at an altitude of 35 ft with one engine failed and maintains during the second segment of the takeoff.
Represented by the SPEED SELECT symbol on the speed scale.
Minimum value equal to 1.13 VS for the corresponding configuration.
Inserted manually through the MCDU by the crew.
Displayed on the MCDU TAKEOFF page.

VREF : Reference speed used for normal final approach.
Equal to 1.23 × VS of configuration FULL.
Displayed on the MCDU APPR page if landing is planned in CONF FULL (VLS CONF FULL).

VAPP : Final approach speed.
Displayed on MCDU APPR page.
Calculated by the FMGCs.
Represents: VAPP = VLS + wind correction.
The wind correction is limited to a minimum of 5 kt and a maximum of 15 kt.
The flight crew may modify VAPP through the MCDU.

- During autoland or when A/THR is on or in case of ice accretion, or gusty crosswind greater than 20 kt, VAPP must not be lower than VLS +5 kt.

Intentionally left blank

GENERAL

Ident.: DSC-22_20-10-00009965.0001001 / 16 MAR 11
Applicable to: ALL

The Flight Management (FM) part controls the following functions:
- Navigation
- Management of flight planning
- Prediction and optimization of performance
- Management of navigation radios
- Management of displays (MCDU, ND, PFD).

Intentionally left blank

NAVIGATION

Ident.: DSC-22_20-20-05-00009966.0001001 / 17 MAR 11
Applicable to: ALL

Essential navigation functions are:
- Computation of position
- Evaluation of position accuracy
- Radio navigation tuning
- Alignment of Inertial Reference System.

Intentionally left blank

GENERAL

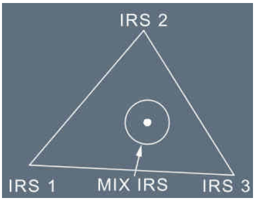
Ident.: DSC-22_20-20-10-00011522.0002001 / 18 AUG 10
Applicable to: ALL

Each FMGEC computes its own aircraft position (called the "FM position") from a MIX IRS position and a computed radio position or GPS position.
The FMGES selects the most accurate position, considering the estimated accuracy and integrity of each positioning equipment.
GPS/INERTIAL is the basic navigation mode, provided GPS data is valid and successfully tested. Otherwise, navaids plus inertial or inertial only are used. (*Refer to DSC-22_20-20-10 Navigation Modes*).

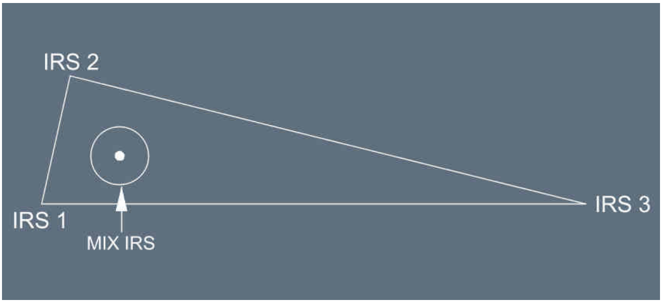
MIX IRS POSITION

Ident.: DSC-22_20-20-10-00011523.0001001 / 18 AUG 10
Applicable to: ALL

Each FMGEC receives a position from each of the three IRSs, and computes a mean-weighted average called the "MIX IRS" position.



- If one of the IRSs drifts abnormally, the MIX IRS position uses an algorithm that decreases the influence of the drifting IRS within the MIX IRS position.



- If one of the IRSs fails, each FMGEC uses only one IRS (onside IRS or IRS3). Each IRS position and inertial speed are continuously tested. If the test fails, the corresponding IRS is rejected.

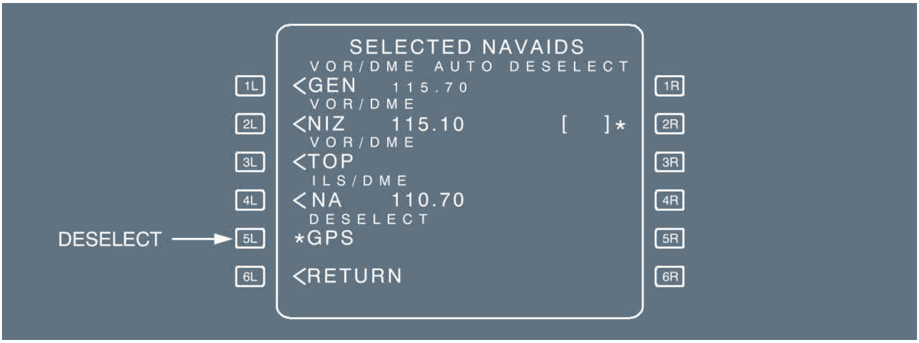
GPS POSITION

Ident.: DSC-22_20-20-10-00011524.0005001 / 20 DEC 13
Applicable to: ALL

Each IRS computes a mixed IRS/GPS position called the GPIRS position. For this, each IRS can independently select their GPS source in order to maximize the availability of GPS data. Of the three GPIRS positions that each FMGEC receives, the FMS selects one GPIRS position based on a figure of merit and priority.

The FMS uses the following hierarchy to perform the selection:
- Onside GPIRS position
- GPIRS 3
- Opposite GPIRS position.

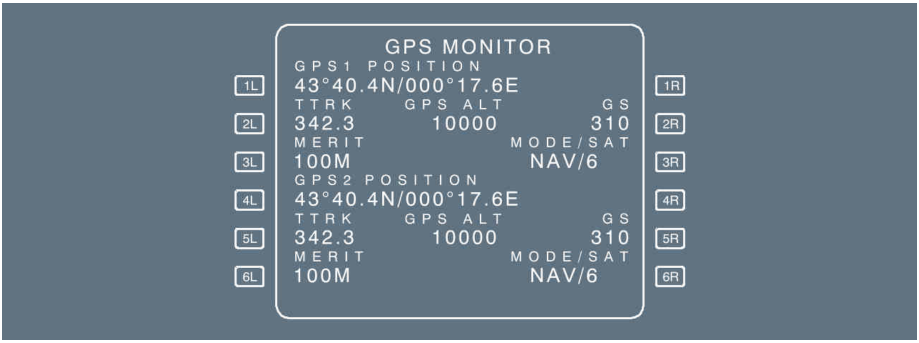
If the GPIRS data does not comply with an integrity criterion that is based on a Horizontal Integrity Limit (HIL) and on the automatic detection of failed satellites, the FMS rejects the GPS mode and uses the radio position update.
The flight crew can deselect/select the GPS position on the SELECTED NAVAIDS page, if necessary.



```
        SELECTED NAVAIDS
  VOR/DME   AUTO DESELECT
<GEN    115.70
  VOR/DME
<NIZ    115.10        [   ]*
  VOR/DME
<TOP
  ILS/DME
<NA     110.70
  DESELECT
*GPS

<RETURN
```

Information about the GPS position is displayed on the GPS MONITOR page.



```
             GPS MONITOR
GPS1 POSITION
43°40.4N/000°17.6E
TTRK         GPS ALT            GS
342.3         10000            310
MERIT                     MODE/SAT
100M                         NAV/6
GPS2 POSITION
43°40.4N/000°17.6E
TTRK         GPS ALT            GS
342.3         10000            310
MERIT                     MODE/SAT
100M                         NAV/6
```

<u>Note:</u> *In nominal case, ADIRU1 selects GPS1 and ADIRU2 selects GPS2. The GPS selection by ADIRU3 depends on the position of the ATT HDG selector switch. If one of the GPS source is rejected by the ADIRUs, all ADIRUs will select the same GPS source. As a result, the data of the GPS that is not selected is dashed on the GPS MONITOR page. The “GPS PRIMARY LOST” message may not be displayed.*

RADIO POSITION

Ident.: DSC-22_20-20-10-00011525.0002001 / 20 SEP 12
Applicable to: ALL

Each FMGEC uses onside navaids to compute its own radio position. These navaids are displayed on the SELECTED NAVAIDS page.

The available navaids are:
- DME/DME
- VOR/DME
- LOC
- DME/DME-LOC
- VOR/DME-LOC.

It uses LOC to update the lateral position, using LOC beam during ILS approach.
LOC is also used for quick update, when in GPS/IRS mode if GPS ◁ , or in IRS mode otherwise.
If one or more navaids fail, each FMGEC can use offside navaids to compute the VOR/DME or DME/DME radio position.
The radio navaid selection is displayed on the DATA "SELECTED NAVAIDS" page.

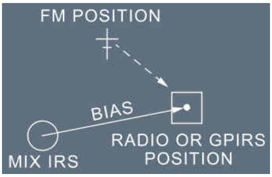
FM POSITION

Ident.: DSC-22_20-20-10-00011526.0009001 / 18 AUG 10
Applicable to: ALL

At flight initialization, each FMGEC displays an FM position that is the mixed IRS/GPS position (GPIRS):

- At takeoff, the FM position is updated to the runway threshold position, as stored in the database and corrected by the takeoff shift when entered by the flight crew.
- In flight, the FM position approaches the radio position, or the GPS position at a rate that depends upon the aircraft altitude.

Note: The FM position update at takeoff is inhibited when GPS PRIMARY is active.



For each IRS, the FMGECs compare the FM position with the IRS position. When this difference exceeds a threshold (depending on the elapsed time since IRS alignment), the "CHECK IRS (1, 2 or 3)/FM POSITION" message is displayed on the MCDUs.
When the FWC detects an abnormal IRS drift, the ECAM triggers the "FM/IR POSITION DISAGREE" message.

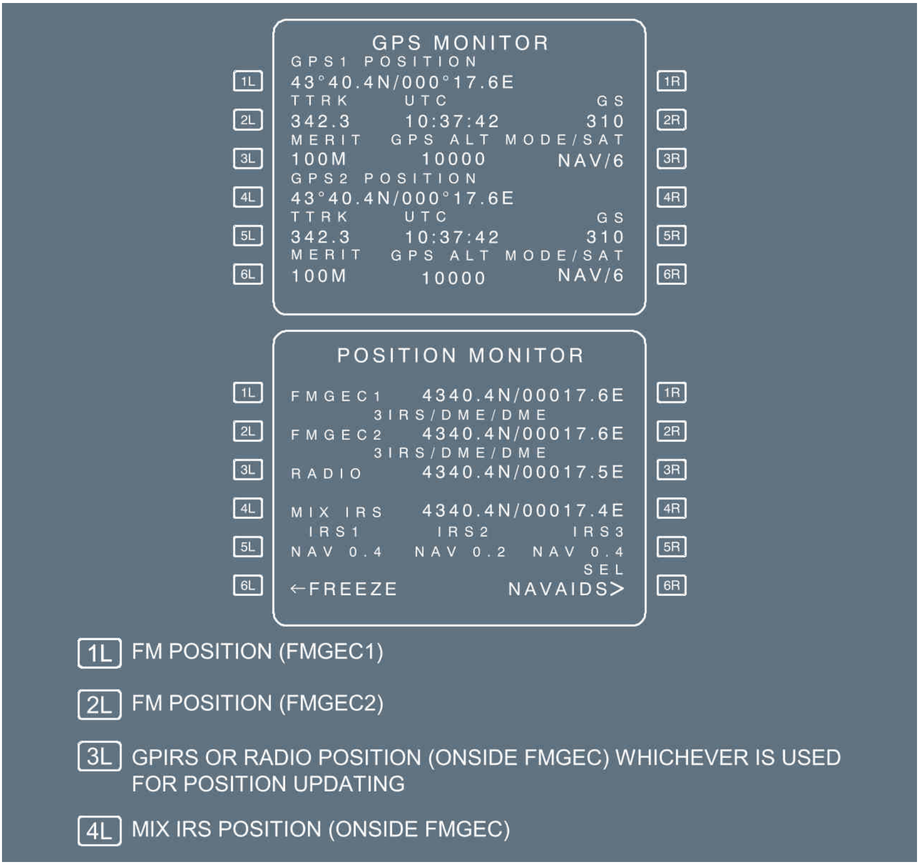
BIAS

Each FMGEC computes a vector from its MIX IRS position to the radio or GPIRS position. This vector is called the "bias".
Each FMGEC continuously updates its bias, if a radio position, or a GPIRS position is available.
If an FMGEC loses its radio/GPIRS position, it memorizes the bias and uses it to compute the FM position, which equals the MIX IRS position plus the bias. Until the radio or the GPIRS position is restored, the bias does not change.
The flight crew can manually update the FM position. This also updates the bias.

POSITION MONITOR

Ident.: DSC-22_20-20-10-00011527.0009001 / 07 MAY 13
Applicable to: ALL

The flight crew may check the position computation using the GPS MONITOR or POSITION MONITOR page.



```
              GPS MONITOR

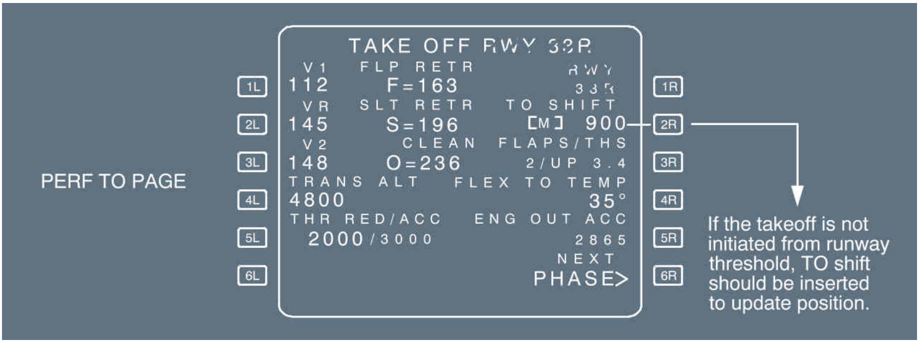
TAKEOFF UPDATE

Ident.: DSC-22_20-20-10-00012327.0006001 / 04 AUG 16
Applicable to: ALL

A takeoff update requires that the takeoff runway be part of the flight plan. This provides the most accurate position update.
If the takeoff run starts at an intersection, enter a takeoff shift on the PERF TO page to refine the takeoff update.
An accurate takeoff update ensures a precise aircraft position during departure.



PERF TO PAGE

TAKE OFF RWY 33R
V1 FLP RETR RWY
112 F=163 33R
VR SLT RETR TO SHIFT
145 S=196 [M] 900
V2 CLEAN FLAPS/THS

TRANS ALT FLEX TO TEMP
4800 35°
THR RED/ACC ENG OUT ACC
2000/3000 2865
NEXT
PHASE>

If the takeoff is not initiated from runway threshold, TO shift should be inserted to update position.

NAVIGATION MODES

Ident.: DSC-22_20-20-10-00011528.0002001 / 15 NOV 21
Applicable to: ALL

The FMGES updates the FM position via the use of radio navaids or GPS, if available. It can use four different FM navigation modes to make this update.

The decreasing order of priority is:
- IRS-GPS
- IRS-DME/DME
- IRS-VOR/DME
- IRS only.

During approach flown with ILS / GLS or SLS , the system performs a temporary lateral update, via one of the following modes:
- IRS-GPS/LOC
- IRS-DME/DME-LOC
- IRS-VOR/DME-LOC
- IRS-LOC.

GENERAL

Ident.: DSC-22_20-20-20-00012229.0009001 / 16 JAN 18
Applicable to: ALL

The FMGES continuously computes an Estimated Position Uncertainty (EPU).
It is an estimate of how much the FM position diverged, and it is a function of the navigation mode that the system uses.

CURRENT NAV MODE	EPU (RATE or THRESHOLD)	REMARK
IRS/GPS	$\sqrt{(FOM^2 + 100^2)}$ (in meters)	FOM = Figure of Merit of GPS position. If above 0.28 NM, the FMS rejects the GPS position.
IRS/DME/DME	Moves toward 0.28 NM.	EPU decreases from the initial value to 0.28 NM.
IRS/VOR/DME	0.1 NM + 0.05 X DME DIST. Minimum: 0.28 NM.	Dependent on the distance between the aircraft and the VOR/DME.
IRS ONLY	+8 NM/h for the first 30 min. 0 NM/h for the following 60 min. +4 NM/h for the following 30 min. 0 NM/h for the following 60 min. +2 NM/h after.	EPU increases continuously.

Note: *After an IRS alignment or at takeoff, the EPU is set to 0.2 NM.*

ESTIMATED POSITION UNCERTAINTY

Ident.: DSC-22_20-20-20-00012230.0043001 / 09 DEC 15
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

The FMS displays the EPU to the flight crew and compares it with the Required Navigation Performance (RNP):
- If the EPU does not exceed the RNP, accuracy is HIGH
- If the EPU exceeds the RNP, accuracy is LOW.

The RNP is displayed in the REQUIRED field of the PROG page. The displayed RNP is (in a decreasing order of priority):
- The value that the flight crew entered
- The navigation database procedure value
- The system’s default value

When a flight crew enters an RNP that is higher than the published value, one of the following messages is displayed: "PROCEDURE RNP IS XX.XX" or "AREA RNP IS XX.XX".
When this occurs, the flight crew should verify the RNP value that was manually entered in the REQUIRED field of the PROG page, and clear or modify it if necessary.

The "AREA RNP IS XX.XX" message is also displayed at the change of flight area if the new RNP (default value) is smaller than the displayed RNP (manually entered).

DEFAULT AREA RNP VALUES	
EN ROUTE and OCEANIC	2 NM
TERMINAL and TAKEOFF	1 NM
APPROACH	GPS / RNAV(GNSS)0.3 NM OTHER CASES 0.5 NM

When one FMGEC changes the NAV accuracy from LOW to HIGH (or HIGH to LOW), the MCDU and the ND display the "NAV ACCUR UPGRAD" (or DOWNGRAD) message. These messages are inhibited when the navigation mode is IRS/GPS.

This message appears on the ND and any MCDU page

When in IRS/GPS mode, the GPS PRIMARY status combines two different criteria:

- The accuracy criterion previously described (HIGH/LOW accuracy)
- An integrity criterion: This is the capability to detect a failure and provide appropriate warning of it. This criterion indicates the confidence that the flight crew can have in the FMS position.

If the GPS PRIMARY status complies with both criteria, "GPS PRIMARY" is displayed on the MCDU (PROG page, [5R] field and scratchpad) and temporarily on the ND.
If the GPS PRIMARY status no longer complies with one of these criteria (Navigation accuracy downgraded or integrity lost), the GPS PRIMARY status is lost, and the MCDU and the ND display the "GPS PRIMARY LOST" message. It is possible to clear the scratchpad message on the MCDU, but not on the ND. During a non-precision approach, a triple-click warning is also triggered.

CAUTION	"HIGH" or "LOW" on the PROG page indicates the FM position accuracy, based on estimated uncertainty. When GPS PRIMARY mode is lost, the flight crew must periodically check this position accuracy. In GPS PRIMARY mode, the position accuracy is always at HIGH.

Message appears on ND and any MCDU page

When the GPS is manually deselected, the "GPS IS DESELECTED" message is displayed on the MCDU, 80 NM before T/D or at approach phase transition.

ESTIMATED POSITION UNCERTAINTY

Ident.: DSC-22_20-20-20-00012230.0042001 / 23 AUG 13
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

The FMS displays the EPU to the flight crew and compares it with the Required Navigation Performance (RNP):

- If the EPU does not exceed the RNP, accuracy is HIGH
- If the EPU exceeds the RNP, accuracy is LOW.

The RNP is displayed in the REQUIRED field of the PROG page. The displayed RNP is (in a decreasing order of priority):
- The value that the flight crew entered
- The navigation database procedure value
- The system's default value

When a flight crew enters an RNP that is higher than the published value, one of the following messages is displayed: "PROCEDURE RNP IS XX.XX" or "AREA RNP IS XX.XX".
When this occurs, the flight crew should verify the RNP value that was manually entered in the REQUIRED field of the PROG page, and clear or modify it if necessary.
The "AREA RNP IS XX.XX" message is also displayed at the change of flight area if the new RNP (default value) is smaller than the displayed RNP (manually entered).

DEFAULT AREA RNP VALUES

FM/GPS POSITION DISAGREEMENT

Ident.: DSC-22_20-20-20-00012338.0002001 / 18 AUG 10
Applicable to: ALL

The lower ECAM displays the "NAV FM/GPS POS DISAGREE" amber caution, when the GPS PRIMARY function is active, and when either of the FMGEC positions deviates from the GPS positions 1 or 2 by more than:

- 0.5' of latitude
- For longitude:
  - 0.5' of longitude, when the aircraft latitude is between 0° and 45°
  - 0.7' of longitude, when the aircraft latitude is between 45° and 60°
  - 1' of longitude, when the aircraft latitude is between 60° and 70°.

Above 70° of latitude, a longitude difference does not trigger the alarm.
The master caution light comes on, and the single chime sounds. This amber caution is inhibited during the takeoff phase.

GENERAL

Ident.: DSC-22_20-20-30-00011539.0001001 / 18 AUG 10
Applicable to: ALL

Radio navaids are tuned for two different purposes: Display and computation.

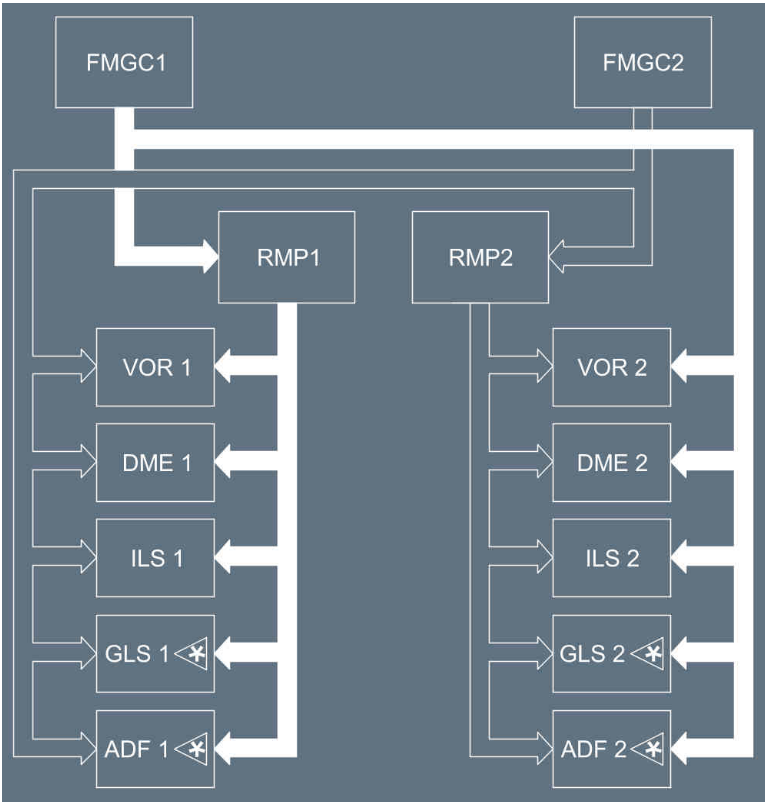
It is possible to perform tuning for display in three different ways:
- Automatic tuning via FMGEC software
- Manual tuning via the MCDU RAD NAV
- Manual tuning via the Radio Management Panel (RMP) if both FMGECs or both MCDUs fail.

The FMGES automatically tunes the radio navaids for computation of the radio position.

Note: *The manual selection of a VOR or VOR/DME may prevent the FMGES from automatically tuning a VOR/DME to compute position. In this case, the related MCDU displays “TUNE BBB FFF.FF” (BBB = ident, FFF.FF = frequency).*

ARCHITECTURE

Ident.: DSC-22_20-20-30-00011540.0008001 / 12 FEB 13
Applicable to: ALL



- In dual mode and independent mode, each FMGEC simultaneously tunes the navaids on its own side (one VOR, one DME, one ILS/GLS ◁✳ , and one ADF ◁✳). In these modes, the flight crew can also manually tune the VOR (and associated DME), the ILS/GLS ◁✳ , and the ADF ◁✳ .
- In single mode, the valid FMGEC tunes navaids on both sides. The flight crew can also use the RAD NAV page to manually tune both VORs, both ADFs ◁✳ and the ILS/GLS ◁✳ .

Manual tuning has priority over automatic tuning.

Note: *If one radio receiver fails, both FMGECs use the operative radio receiver to compute the position of the aircraft.*

VOR

Ident.: DSC-22_20-20-30-00011541.0001001 / 18 AUG 10
Applicable to: ALL

Each FMGEC may tune one VOR only (manually or automatically).

Automatic tuning complies with the following priorities for tuning the VOR:
1. The specified navaid for the approach
2. The navaid that the flight crew should use to compute the current radio position
3. For display purposes:
   - A specified navaid for the active flight leg
   - The “TO” waypoint (TO WPT), if it is a navaid
   - The “FROM” waypoint (FROM WPT), if it is a navaid
   - A waypoint farther along the flight path, if it is a navaid
   - The navaid closest to the current position of the aircraft.

The scratchpad displays “SPECIFIC VOR-D UNAVAIL” if the VOR or the VOR/DME that the flight crew requires for tuning is deselected.

Note: *If the manual selection of a VOR does not agree with the VOR requested for automatic tuning, the related MCDU displays : “TUNE BBB CRS XXX” (BBB = ident of the requested VOR) ; (XXX = course of the requested VOR)*

DME

Ident.: DSC-22_20-20-30-00011542.0003001 / 18 AUG 10
Applicable to: ALL

Each FMGEC automatically uses its four DME frequencies as follows:
- One DME frequency for display. It is possible to tune it manually or automatically. This DME frequency is also used for computation of the VOR/DME position.
- Two DME frequencies in DME/DME mode to calculate the radio position of the aircraft. The FMGEC automatically tunes these as a function of their best accuracy. The flight crew does not receive any indication that this process is happening.
- One DME frequency connected to ILS/DME.

ADF

Ident.: DSC-22_20-20-30-00011544.0001001 / 18 AUG 10
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The FMGEC automatically tunes one ADF in any area if the "TO" or "FROM" waypoint is a Non Directional Beacon (NDB), or in approach when the flight plan specifies an NDB approach and a fix in the approach is the "TO" waypoint. The scratchpad displays “SPECIFIC NDB UNAVAIL” if the NDB that the flight crew requires for automatic tuning is deselected.

ILS/MLS

Ident.: DSC-22_20-20-30-00011548.0001001 / 18 AUG 10
Applicable to: ALL

Each FMGEC automatically tunes one ILS frequency (and one MLS ◁ simultaneously):
- In PREFLIGHT or TAKEOFF phase, when the takeoff runway has an associated ILS/MLS
- In CLIMB, CRUISE, DESCENT, APPROACH, or GO-AROUND phase, when the type of approach in the flight plan is ILS/MLS
- When the direct distance to the destination is less than 300 NM.

The scratchpad displays “RWY/LS MISMATCH”, when the flight crew has manually tuned the ILS, and the entered frequency disagrees with the LS or LOC IDENT/FREQ requested for autotuning.

SELECTION OF NAVAIDS ON MCDU PAGES

Ident.: DSC-22_20-20-30-00011549.0001001 / 12 JUL 12
Applicable to: LV-GKO, LV-GKP

The MCDU displays the navaids tuned by the FMGEC on two pages:
- The RADIO NAV page
- The SELECTED NAVAIDS page.

THE RADIO NAV PAGE

This page shows which navaids have been automatically or manually tuned for display.

    If the closest navaid found in the database is of a different type (e.g. VOR instead of VOR/DME), the flight crew will obtain a partial tuning (e.g. VOR indication instead of VOR/DME indication).
  - ENTER the course.

NAVAID IDENTIFICATION

Ident.: DSC-22_20-20-30-00011551.0001001 / 14 MAY 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

CHECK the decoding of the ILS identifier on PFD and the VOR or ADF identifier on ND.
When the navaid identifier is decoded in agreement with that published, no audio check is necessary.
When the decoding is different from the published one, check the audio. Due to Morse coding inaccuracy, wrong decoding may sometimes occur.

ALIGNMENT OF INERTIAL REFERENCE SYSTEM

Ident.: DSC-22_20-20-40-00011552.0003001 / 18 AUG 10
Applicable to: LV-KHT, LV-KHU

The FMGES uses the reference point coordinates of the departure airport to align the IRS.
It automatically calls these up from the database after the flight crew has entered a company route or an origin-destination city pair and pressed the ALIGN IRS key on the MCDU. The flight crew can manually adjust these coordinates to the gate position. A normal alignment takes 10 min, a fast alignment takes 30 s.
A fast alignment is used to refine a position when time is limited.

DEPARTURE AIRPORT REFERENCE COORDINATES

PRESSING THIS KEY BROADCASTS THE COORDINATES TO IRS IN ALIGN PROCESS.

Note: *If the "IRS IN ALIGN" memo flashes during the alignment, this indicates that:*
- *It has detected excessive motion (it automatically restarts the alignment), or*
- *It has detected a mismatch between the position the MCDU has sent to the IRS and the last memorized IRS position, or*
- *It has detected a mismatch between the latitude the flight crew has entered (which is sent by the MCDU to the IRS) and the latitude the IRS has computed during the alignment.*

ALIGNMENT OF INERTIAL REFERENCE SYSTEM

Ident.: DSC-22_20-20-40-00011552.0008001 / 18 AUG 10
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The preferred way of initializing the ADIRS is to use the GPS position, because this does not require any flight crew intervention. Less than 1 min after setting the ADIRS to NAV, the INIT page displays the GPS position without displaying the ALIGN IRS prompt.
If the flight crew enters a CO RTE or FROM/TO, the INIT page displays the departure airport reference-point coordinates, and the ALIGN IRS prompt appears. If this prompt key is not pressed, the ADIRS is initialized to the GPS position at the end of the alignment time.
At any time during the alignment, the flight crew can manually adjust the coordinates displayed on the INIT page. The ALIGN IRS prompt reappears.
If the ALIGN IRS prompt key is pressed, the coordinates displayed on the INIT page are sent to the ADIRS for initialization. This is the alternate method for ADIRS initialization, when the GPS position is not available.
A normal alignment takes between 5 and 10 min (depending on the local latitude). At latitudes between 73° and 82° (North or South), the alignment takes about 17 min. The ADIRS cannot be aligned beyond 82° (North or South).
A fast alignment takes about 30 s, and it is used for improving the ADIRS initial position accuracy, when time is limited.

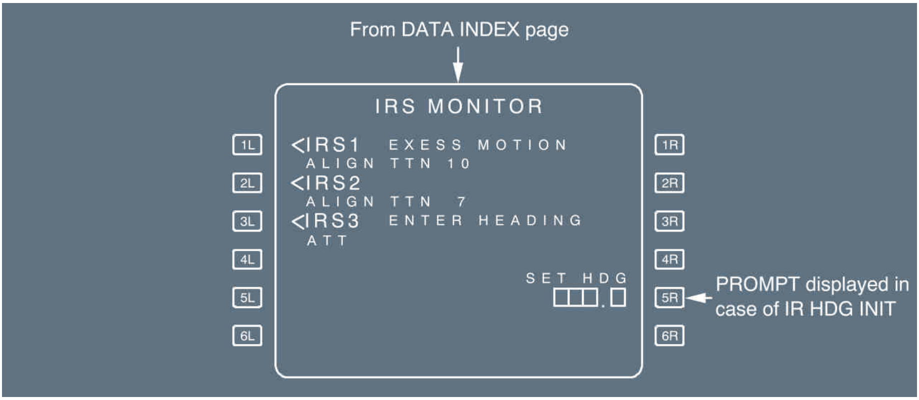
IR IN ATT MODE: HDG SET

Ident.: DSC-22_20-20-40-00011553.0001001 / 01 OCT 12
Applicable to: ALL

When one IRS at least is in ATT mode, the flight crew must set and periodically update the heading to have an attitude information. The entry is performed on the MCDU IRS MONITOR page.



From DATA INDEX page

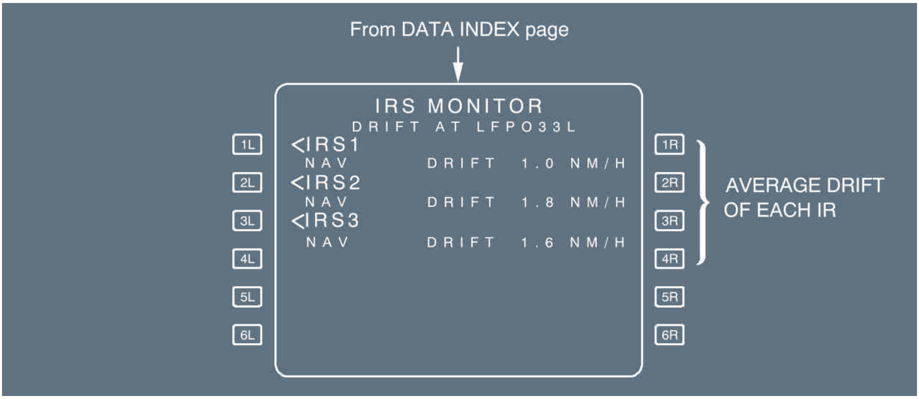
AVERAGE DRIFT COMPUTATION

Ident.: DSC-22_20-20-40-00012127.0001001 / 01 OCT 12
Applicable to: ALL

The FMGEC computes an average drift on the ground at the end of the flight for each IR. This drift is then displayed on the IRS page.
The drift is the difference between the IR position at landing and the geographic landing position (destination runway threshold plus a shift of 400 m).



```
        IRS MONITOR
      DRIFT AT LFPO33L
<IRS1
 NAV          DRIFT  1.0 NM/H
<IRS2
 NAV          DRIFT  1.8 NM/H
<IRS3
 NAV          DRIFT  1.6 NM/H
```

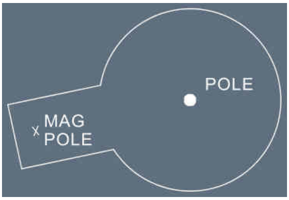
The FMGEC then computes the time since last alignment.

POLAR NAVIGATION

Ident.: DSC-22_20-20-40-00011554.0001001 / 27 MAY 13
Applicable to: LV-KHT, LV-KHU

The IRS can provide the MAG HEADING between latitudes 82°N and 60°S, except in the vicinity of North magnetic pole.
The FMGEC computes the aircraft position within polar area even at the North pole by using the MIX IRS position.

Note: *The IRS may be aligned up to latitude 73°N, without using a specific procedure. Between 73° and 82° (North or South), the required alignment time is longer and a specific procedure has to be performed. Beyond 82° North or South, no ADIRS alignment is possible.*



As a general rule, the MCDU displays all parameters referenced to North, depending on the position of the NORTH REF pb-sw.

In order to provide the SAFEST and most FLEXIBLE operation, a MAG/TRUE NORTH REF pb-sw is available, with various messages provided on the EFIS ND, the MCDU, and the ECAM, indicating to the flight crew what reference should be applicable in the flight area the aircraft is located.

POLAR NAVIGATION

GENERAL

Ident.: DSC-22_20-20-50-00012129.0001001 / 09 MAR 15
Applicable to: ALL

Overall navigation performance is mainly based on two elements:
- The accuracy of the aircraft position calculation
- The validity of the flight path definition, as extracted from the navigation database.

The level of validation depends on the type of operations. For example, JAA TGL 10 requires that, for Precision RNAV in terminal area, providers and operators implement a quality assurance program for the navigation database, which may include a navigation database validation process. The highest level of validation is required for RNAV approach, with lateral and vertical navigation.
The navigation databases are revised every 28 days (AIRAC cycle). Flights should be conducted with a navigation database that is within its cycle. This should be checked on the AIRCRAFT STATUS MCDU PAGE.

Intentionally left blank

FLIGHT PLANNING

Ident.: DSC-22_20-30-05-00012128.0001001 / 18 AUG 10
Applicable to: ALL

The flight crew uses the MCDU to insert flight plans into the FMGES:
- A lateral flight plan that defines the intended horizontal flight path
- A vertical flight plan that defines the intended speed and altitude profile for the aircraft to follow while flying the lateral flight plan.

Note: The flight planning function is available for both the primary and secondary flight plans.

The FMGES can contain two different flight plans:
- The ACTIVE flight plan, which is the basis for:
  - Lateral and vertical guidance
  - MCDU and ND display
  - Radio navigation autotuning
  - Performance predictions
  - Fuel planning.
- The SECONDARY flight plan which the flight crew may use:
  - To prepare and store a second departure procedure before takeoff
  - To plan a diversion
  - To prepare the next flight leg
  - To compare predictions or evaluations.

Each flight plan is composed of the same elements:
- The primary flight plan, from origin to destination and missed approach
- The alternate flight plan, from destination to alternate destination.

The flight crew enters the flight plan in either of two ways:
- Automatically by selecting a company route. Such a selection will call all the elements of the route out of the database.
- Manually by selecting an ORIGIN/DEST pair, and then selecting all successive waypoints, procedures, and vertical constraints on the MCDU.

The flight crew may then modify the flight plan on the ground or in flight, by making lateral and vertical revisions.

Intentionally left blank

General

GENERAL

Ident.: DSC-22_20-30-10-05-00011404.0003001 / 05 MAR 19
Applicable to: ALL

To insert the lateral flight plan, the flight crew can use either a company route number or an ICAO four-letter city pair. The lateral flight plan includes the following elements:

- Departure
  - Takeoff runway
  - SID
  - En route transition.
- En route
  - En route waypoints and airways.
- Arrival
  - En route transition
  - STARs/VIAs
  - Landing runway with selected approach
  - Missed approach.
- Alternate flight plan.

These elements are defined by waypoints and legs between the waypoints.

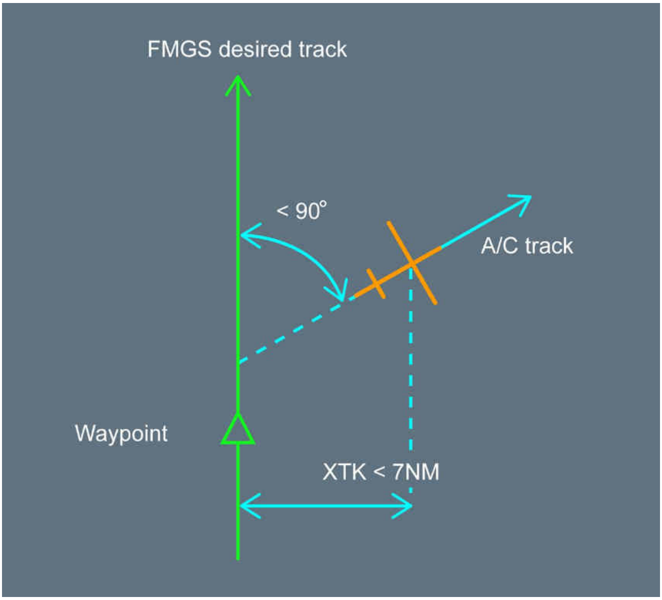
TOU 08

The FMGEC strings the legs in sequence automatically.
The flight plan has a discontinuity if any two waypoints do not have a leg defined between them.
The computer assumes that the aircraft will fly a direct leg between the two waypoints that define the discontinuity.

Note: *When the aircraft enters a flight plan discontinuity, the NAV mode automatically switches to the HDG/TRK mode.*

In HDG/TRK mode, a flight plan waypoint is sequenced if the following conditions are met:

- The waypoint is behind the aircraft and the aircraft is less than 7 NM from it
- The angle between the current aircraft track and the track of the leg is less than 90 °.



Note: *If the flight crew revises the lateral flight plan with the DIR TO INTERCEPT function, the waypoints of the revised flight plan are sequenced when the aircraft is in the above mentioned conditions.*

The FMGES automatically strings additional types of legs when departure or arrival procedures (SID-STAR-TRANS) are defined.

Some of these legs are specific legs, such as:
- DME arc leg
- Holding pattern to a fix or reverse turn
- Course-to-fix leg
- Radius-to-fix leg
- Heading leg
- MANUAL leg.

The flight crew cannot create these types of legs: They are part of the stored departure/arrival procedures they have selected.

The flight crew can create only direct legs between manually defined geographic points (navaids, airports, waypoints).

STAR
TRANS
Arrival
Cruise
TRANS
EOSID
SID
Takeoff Runway
Departure Airport
Departure
Destination Flight Plan

<u>Note:</u> *The departure and arrival procedures are defined in the database to minimize the amount of memory required.*

They are divided as follows:
- *DEPARTURE = SID + EN ROUTE TRANSITION*
- *ARRIVAL = APPR VIA + STAR + EN ROUTE TRANSITION*

The SID is the central common part of the departure procedure, as the STAR is of the arrival procedure. En route transitions (TRANS) are the various possible trajectories defined between the last point of the SID and the first en route waypoints and between the last en route waypoint and the first fix of the STAR. "APPR VIAs" are the possible trajectories defined between the last point of the STAR and the first point of the approach.

MANUAL LEGS

Ident.: DSC-22_20-30-10-05-00011405.0001001 / 18 AUG 10
Applicable to: ALL

A MANUAL leg stays on a constant TRK or HDG and has no termination point. The flight crew cannot insert it into a flight plan manually: it is part of a given procedure such as a SID or a STAR. When the aircraft is flying a MANUAL leg, the NAV mode remains engaged and predictions assume that the aircraft will fly a direct leg from its present position to the next waypoint (DIR TO). When the aircraft is cleared to fly to the next waypoint of the flight plan, the flight crew performs a DIR TO.

<u>Note:</u> *1. In NAV mode, a MANUAL leg is sequenced only by performing a DIR TO.*
2. The use of the descent mode (DES) on a MANUAL leg is not recommended.

FLIGHT PLAN CAPACITY

Ident.: DSC-22_20-30-10-05-00011407.0003001 / 04 NOV 20
Applicable to: ALL

In terms of flight plan capacity, the FMS takes into account 3 flight plans:
- The active flight plan
- The secondary flight plan
- The temporary flight plan.

Each flight plan can contain up to 200 legs. If a flight plan contains 200 legs, and if the flight crew attempts to perform a lateral revision that increases the number of legs of this flight plan, the FMS rejects the revision and the MCDU displays the F-PLN FULL message.

For the active and secondary flight plans, the primary parts must contain less than 165 legs, and the alternate parts must contain less than 35 legs.

LATERAL REVISIONS

Ident.: DSC-22_20-30-10-05-00011408.0003001 / 14 MAY 12
Applicable to: ALL

The flight crew can revise the lateral flight plan following two types of revisions:

1. Lateral revisions that have an immediate effect on the active flight plan:
   - The flight crew inserts a new waypoint directly on the F-PLN page, deletes or changes a waypoint from it.

When the flight crew enters a new waypoint that does not exists in the flight plan, the following waypoint moves down the flight plan, with a discontinuity shown after the new waypoint.

   - The flight crew adds a direct leg (DIR TO) from his present position to a selected waypoint. The flight crew can change the “TO” waypoint of the active leg. The DIR TO function gives access to DIR TO, DIR TO ABEAM or DIR TO/INTERCEPT. The active leg then goes from the present position (T/P) to the waypoint selected or inserted as the new “TO” waypoint.

2. Lateral revisions that lead to a temporary flight plan (TMPY) before they take effect:
   The flight crew creates a temporary flight plan then inserts it as a revision to the active flight plan. The flight crew does this when selecting, deleting, or modifying several waypoints of an airway or procedure at once (SID, STAR, HOLD, TAKEOFF or LANDING RWY). This modification is made on specific "LAT REV" pages from the flight plan page.

Possible revisions are:
- Insert or modify departure procedure
- Insert or modify arrival procedure
- Insert a waypoint
- Change the destination
- Insert an airway
- Insert an offset
- Insert a holding pattern
- Select or enable an alternate flight plan
- Fix information.

The purpose of the temporary flight plan is to allow the flight crew to review the revision on the MCDU and on the ND before inserting it into the active flight plan.
It is a copy of the active flight plan that has been changed according to the flight crew revision.
While it is displayed, the aircraft will continue to follow the original active flight plan.
No predictions are computed or displayed on the pages of the temporary flight plan.

GENERAL

Ident.: DSC-22_20-30-10-15-00009230.0001001 / 03 NOV 21
Applicable to: ALL

The lateral revision function allows the flight crew to create or modify the following parts of the flight plan:
- Airway
- Waypoint
- New destination
- Holding pattern
- Offset
- Alternate
- Fix information
  Each time the flight crew activates one of the revisions listed above, the flight crew accesses to a temporary flight plan that allows to check the modification before inserting it in the active flight plan. The flight crew selects these functions by pressing the left keys on F-PLN A or B.
- Direct to and overfly functions are accessed through MCDU keys. No temporary flight plan is created with these functions.
- “Update at” capability is a specific function that manually updates the FM position. It does not use a temporary flight plan, but the flight crew must confirm the insertion before it is activated.

TEMPORARY F-PLN (TMPY)

Ident.: DSC-22_20-30-10-15-00009231.0001001 / 15 FEB 11
Applicable to: ALL

When a pilot makes a lateral revision to the F-PLN, the FMGS creates a temporary flight plan. This is a copy of the active F-PLN, but is corrected by the lateral revision in progress.
The aircraft continues to follow the active F-PLN until the temporary revision is inserted.
The revision appears in yellow characters on both MCDUs and NDs.

- Lateral and vertical revisions cannot be made to a temporary F-PLN.
- Only one temporary F-PLN may be accessed at a time.
- The “DIRECT TO” function, when used, erases a temporary F-PLN.
- When a DIR TO is in process, a temporary revision cannot be displayed on the other MCDU.
- A TMPY F-PLN changes the title of the flight plan pages. (TMPY appears in all titles).
- No predictions are computed for a temporary flight plan (Dashes are displayed).

←ERASE          INSERT*
                     ↑↓
```

Press 6R to insert the TMPY F-PLN into the active F-PLN

Press 6L to erase a TMPY F-PLN (the crew does not want to activate the lateral revision)

Temporary data are displayed in yellow (ND and MCDU). Once inserted they become active and are displayed in green.

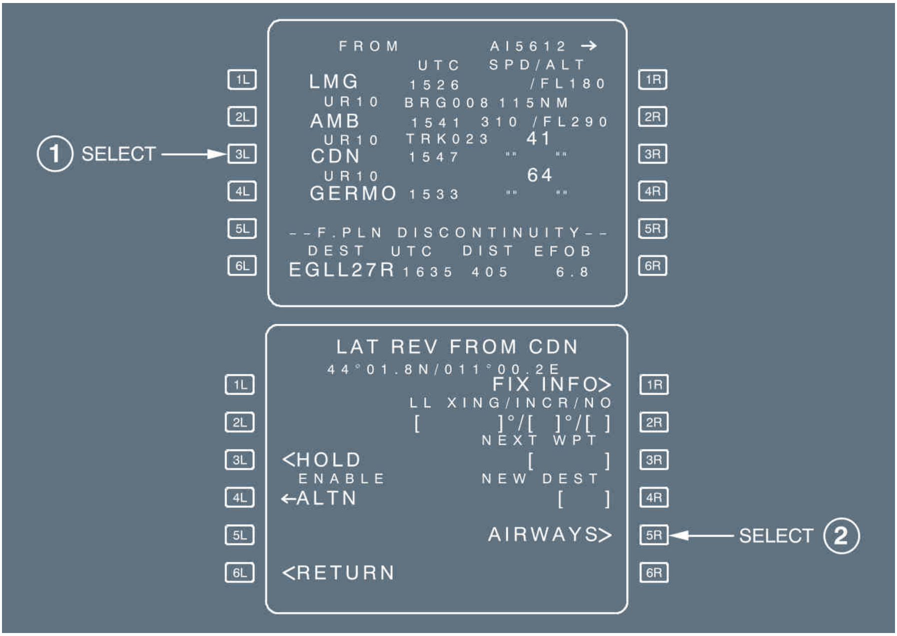
INSERTING AN AIRWAY WITH "VIA"

Applicable to: ALL

Ident.: DSC-22_20-30-10-15-A-00009232.0001001 / 14 MAY 12

GENERAL

The pilot can insert into the active flight plan, up to 5 successive airway segments going from a revised waypoint or ending at a given waypoint of the flight plan.



```

FLIGHT PLAN INSERTION

The flight crew inserts the flight plan either directly from the AIRWAYS page or from the TMPY F-PLN page. In both cases :

PRESS [6R] to insert the temporary flight plan. Clear the flight plan discontinuity as necessary.

INSERTING A WAYPOINT

Ident.: DSC-22_20-30-10-15-B-00009236.0001001 / 15 FEB 11
Applicable to: ALL

GENERAL

The pilot can insert waypoints by two methods :
- directly into the flight plan. All modifications go directly into the active flight plan. No temporary flight plan is created.
- by means of a lateral-revision at “NEXT WAYPOINT”, a process that creates a temporary flight plan.

The second method allows to check the temporary flight plan before inserting it.

Ident.: DSC-22_20-30-10-15-B-00009237.0003001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

WAYPOINT IDENTIFICATION

The flight crew can identify a waypoint by:
- Its identifier (if it is in the navigation database)
- A latitude/longitude (AxxByyy: A appears as either N for North, or S for South, and B appears as either, E for East or W for West)
- A Place/Bearing/Distance (PBD). The waypoint is defined by its bearing and distance from a place.

- A Place-Bearing/Place-Bearing (PBX). The waypoint is defined by the interception of 2 radials from 2 places.
- A Place/Distance (PD). The waypoint is defined by a distance from a place, along the F-PLN.

Note: *If a slash or a dash is not entered properly, the MCDU scratchpad displays a FORMAT ERROR message.*

When the FMGES receives a waypoint not in the database, it identifies waypoint as AxxByyy, PBDnn, PBXnn or PDnn (nn is a two-digit number between 01 and 99) and stores it in the stored waypoints file of the database.

Note: *When NAV mode is engaged, the flight crew cannot modify the "TO" waypoint (active leg) using the waypoint insertion function. If the flight crew wants to modify it, the DIR TO function will be used.*

Ident.: DSC-22_20-30-10-15-B-00009237.0001001 / 15 FEB 11
Applicable to: LV-GKO, LV-GKP

WAYPOINT IDENTIFICATION

The pilot can identify a waypoint by:
- Its identifier (if it is in the navigation data base)
- A Latitude/Longitude (AxxByyy: A appears as either N for North, or S for South, and B appears as either, E for East or W for West)
- A Place/Bearing/Distance (PBD). The waypoint is defined by its bearing and distance from a place.
- A Place-Bearing/Place-Bearing (PBX). The waypoint is defined by the interception of 2 radials from 2 places.
- A Place/Distance (PD). The waypoint is defined by a distance from a place, along the F-PLN.

Note: *If a slash or a dash is not entered properly, the Multifunction Control and Display Unit displays a “FORMAT ERROR” message.*

When the Flight Management Guidance System receives a waypoint not in the data base, it identifies it as AxxByyy, PBD xx, PBX xx or PD xx (xx is a two-digit number between 01 and 20) and stores it in the stored waypoints file of the database.

Note: *When NAV mode is engaged, the crew cannot modify the "TO" waypoint (active leg) using the waypoint insertion function. If the crew wants to modify it, the DIR TO function will be used.*

WRITE the waypoint identifier or LAT/LONG, Place/Bearing/Distance or Place-Bearing/Place-Bearing into the scratchpad. (Example : Place : LMG, Bearing: 330 °, Distance : 135 NM)
PRESS the appropriate key to enter the waypoint into the flight plan. The rule is that the new waypoint appears next to the pressed key, and the previous waypoint moves down the flight plan path.

This operation creates a discontinuity between the new waypoint and the previous one. The new flight plan will have to be cleared of the discontinuity and some waypoints erased.

WRITE the waypoint identifier and distance from this place.

According to the sign of the distance, the crew may define an along track waypoint before or after the revised place. (Example : AMB/-040).

PRESS the appropriate key adjacent to the place identifier. The system positions the waypoint automatically in the flight plan.

This operation does not create any discontinuity.
The system does not accept an along track waypoint entered at the FROM waypoint.

SELECT the lateral revision (LAT REV) function at an appropriate waypoint.
WRITE the waypoint identifier, or LAT/LONG, or Place/Bearing/Distance, or Place-Bearing / Place-Bearing into the scratchpad.
ENTER it in the brackets under NEXT WPT (next waypoint).
INSERT the temporary flight plan by depressing the [6R] key
CLEAR the F-PLN discontinuity as appropriate.

Applicable to: ALL

LATITUDE/LONGITUDE CROSSING WAYPOINT INSERTION

This function allows the insertion of one or several points along the flight-plan beyond the revised waypoint at fixed latitude or longitude intervals (INCR) from a specified latitude or longitude. These waypoints are not considered as part of the flight crew defined elements, the system deletes them when sequenced.

CORRESPONDING ND

WRITE the latitude (NXX, XXN, SXX or XXS), the required increment in degrees between the successive waypoints and the number of required waypoints.

(Example: The flight crew wants to get 3 points, every degree from latitude N46: the flight crew enters N46/1/3).

PRESS [2R] to insert into the LL XING/INCR/NO field.

PRESS [6R] to insert the new waypoints in the flight plan without discontinuity.

The system does not store these waypoints in the database.

FIX INFO

Ident.: DSC-22_20-30-10-15-C-00009242.0001001 / 01 OCT 12

Applicable to: LV-GKO, LV-GKP

When using FIX INFO function, the flight crew defines waypoint intersections of the flight plan with radials associated to a fix.

When the flight crew inserts the intersection point, the system identifies automatically this point, but does not store it in the navigation database.

FIX INFO function offers 2 possible waypoint insertions : radial intercept waypoint and abeam intercept waypoint.

Ident.: DSC-22_20-30-10-15-C-00009242.0003001 / 01 OCT 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

When using the FIX INFO function, the flight crew defines waypoint intersections of the flight plan with radials, circle or abeam associated to a fix.
When the flight crew inserts the intersection point, the system identifies automatically this point, but does not store it in the navigation database.

Ident.: DSC-22_20-30-10-15-C-00009244.0001001 / 14 MAY 12
Applicable to: LV-GKO, LV-GKP

INSERTING OF A RADIAL INTERCEPT WAYPOINT

The flight crew accesses the radial intercept function from the lateral revision page at origin or at the “from” waypoint.

INSERTING A NEW DESTINATION

Ident.: DSC-22_20-30-10-15-00009246.0001001 / 14 MAY 12
Applicable to: ALL

The pilot may define a new destination and insert it through the lateral revision page. The pilot may then call up the new destination from any waypoint along the flight plan except the FROM waypoint, the destination, and the missed-approach waypoint. When the new destination has been inserted, a flight plan discontinuity appears between the revision waypoint and the new destination. All waypoints beyond the revision waypoint (including the previous destination and associated missed approach) are deleted.

HOLDING PATTERN

Ident.: DSC-22_20-30-10-15-D-00009247.0001001 / 15 FEB 11
Applicable to: ALL

Holding pattern description, associated guidance and flight crew procedures are put together in this chapter.
The flight management and guidance computer (FMGC) has three types of holding pattern that the pilot can use in a flight plan.

Ident.: DSC-22_20-30-10-15-D-00009248.0001001 / 21 NOV 11
Applicable to: ALL

HOLD TO FIX (HF)

The holding pattern is always part of an arrival or departure procedure. The aircraft flies it once and then exits the holding pattern automatically at the fix. The predicted speed in the holding pattern is the lowest of ICAO speed limit, max endurance speed, or any speed constraint.
Guidance to the fix in the holding pattern is similar to that on any leg of a flight plan. The HF patterns are part of the navigation database and cannot be created by the crew.

Ident.: DSC-22_20-30-10-15-D-00009249.0001001 / 21 NOV 11
Applicable to: ALL

HOLD TO ALTITUDE (HA)

This type of holding pattern is also part of an arrival or departure procedure.
The aircraft flies the hold until it reaches the specified altitude. Then it exits the hold automatically at the fix.
The predicted speed for the holding pattern is the lowest of the ICAO speed limits, the max endurance speed or any speed constraint.
The size of the holding pattern is a function of the predicted speed.
Guidance in a hold to altitude (HA) is similar to that for any leg of a flight plan.
The HAs are in the navigation database as part of arrival or departure procedures and cannot be created by the crew.

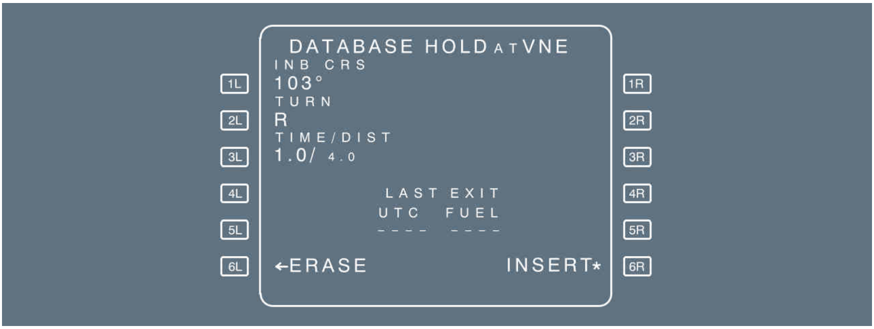
HOLD TO ALTITUDE AT LFBO
(DEPARTURE PROCEDURE)

Ident.: DSC-22_20-30-10-15-D-00009250.0001001 / 14 MAY 12
Applicable to: LV-GKO, LV-GKP

HOLD WITH MANUAL TERMINATION (HM)

This type of holding pattern may be part of an arrival procedure, or the pilot may enter it at present position or at any flight plan waypoint.
The pilot will use this type of holding pattern to comply with a defined procedure or a clearance limit or to meet an operational need (such as losing altitude, holding for weather improvement, or absorbing an ATC delay).
This type of holding pattern is exited under pilot decision and not automatically.
There are 3 types of HM, all are modifiable.

DATABASE HOLD



DATABASE HOLD AT VNE
INB CRS
103°
TURN
R
TIME/DIST
1.0/ 4.0
LAST EXIT
UTC FUEL
---- ----
←ERASE INSERT*

If the holding pattern is part of the database, it is named DATABASE HOLD and all its associated data (inbound course, turn direction, time/distance) are defined in the data base. Flight crew can modify this data.

             1228   3.2
<RETURN
```

If the pilot inserts into the active flight plan a holding pattern that is manually corrected from a hold defined by the FMGS, the screen displays a “HOLD AT ...” page. The field 2R displays REVERT TO DATABASE or REVERT TO COMPUTED to restore the database data if necessary.

PREDICTIONS AND GUIDANCE ASSOCIATED WITH AN HM HOLDING PATTERN (HOLD WITH MANUAL TERMINATION)

Before Deceleration

Although the hold is inserted into the flight plan, the FMGES does not take it into account for predictions until the aircraft enters the hold.
However, if the hold is not deleted by the crew, the FMGES schedules a deceleration point and displays it on the ND.

The FMGES predicts the estimated time and amount of fuel remaining at which the aircraft must exit holding so as to comply with the fuel policy specified on the fuel prediction page. When the aircraft enters the holding pattern, the FMGES revises all predictions and assumes the aircraft will fly one turn of the holding pattern.

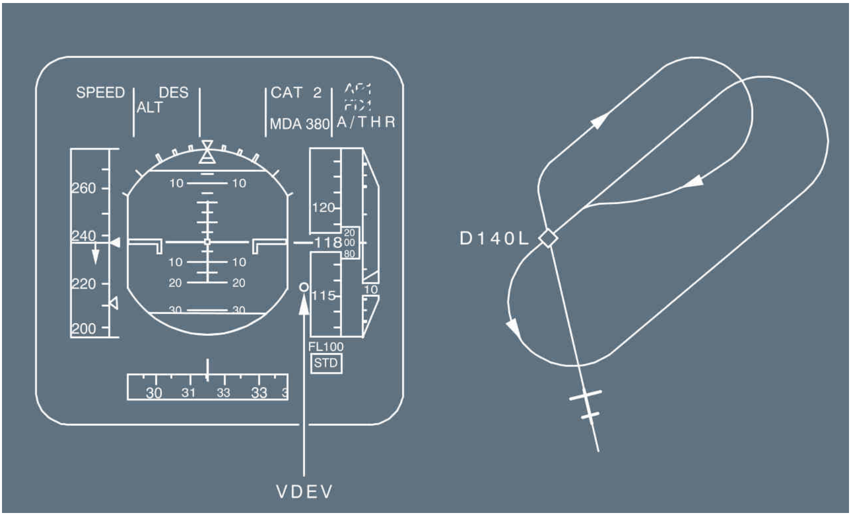
All predictions are revised if there is one additional holding pattern when the holding fix is overflown.

On Reaching the Speed Change Pseudo Waypoint

The FMGES either causes the aircraft to decelerate to the hold speed (if managed speed is active and NAV mode engaged), or displays “SET HOLD SPD” (set hold speed) on the MCDU and primary flight display if the flight crew has selected a speed target.

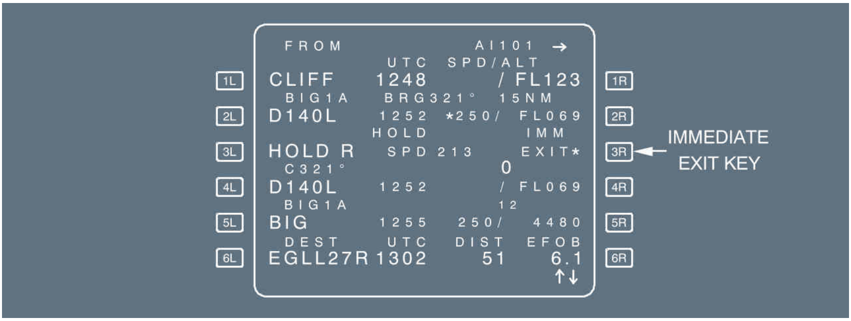
The default hold speed is the lowest of:
- Maximum endurance speed
- ICAO limit holding speed
- Speed constraint (if any).

When no specific speed limit applies, the default hold speed is the Maximum Endurance speed, which is approximately equal to Green Dot in clean configuration (it can vary between Green Dot and Green Dot +10 kt, depending on the aircraft weight, altitude and temperature). The flight plan predictions for time and fuel do not yet consider that the hold will be flown. However, the navigation display shows the hold entry and holding pattern trajectory.



Deceleration receives priority, so that when the aircraft is in descent with the descent mode engaged, it will deviate above the descent path to decelerate. (VDEV becomes positive on the progress page).
The flight plan page displays an immediate exit prompt.

If the flight crew presses the key next to “IMM EXIT” before arriving at the holding fix, the aircraft will not enter the holding pattern, but will resume its phase-related managed-speed profile.



```

After Reaching the Hold Entry Fix

The aircraft enters the hold. The MCDU HOLD page displays the associated holding data:
- The inbound course (INB CRS)
- The TURN direction (L or R)
- The TIME/DIST
- The LAST EXIT time and the associated fuel to reach the alternate airport with no extra fuel.

The FMS assumes that the aircraft will fly one turn of the holding pattern, and revises the predictions accordingly.

When the holding pattern is defined by a leg time (and not a leg distance), the system revises the size of the hold as a function of the target speed:
- If managed speed is active, the system uses the predicted holding speed to calculate the size of the holding pattern.
- If the selected speed is active, the system uses the target speed the flight crew selects at the entry fix sequencing to calculate the size of the holding pattern.
- The VDEV displayed on the primary flight display and the PROG page when the aircraft is flying in the HM (hold pattern with manual termination) is the difference between the aircraft's current altitude, and the altitude at which it should be, when it reaches the hold exit fix in order to be positioned correctly on the descent path.

HOLD EXIT PROCEDURE

Position (1) If “IMM EXIT” pressed, aircraft will exit at next fix overfly.
Position (2) If “IMM EXIT” pressed, aircraft will make an immediate turn to the fix where hold will be exited.

- **If managed speed is active** , the computer sets the target speed to the applicable speed of the current phase (for example, speed constraint, ECON speed, or speed limit).

  The computer then bases its predictions on the assumption that the flight will continue on the descent path, if the aircraft is in a descent.

- **If DES mode is engaged**

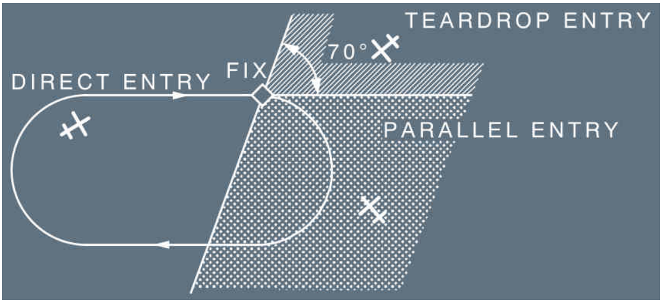
  the following applies:
  - The holding pattern is never included in the descent path computation.
  - The flight crew cannot enter altitude and speed constraints at the hold exit fix (this is only allowed at the hold entry fix).
  - The vertical guidance in the HM during the descent phase calls for a constant -1 000 ft/min, but the computer considers altitude constraints that will take effect farther down the flight path as it calculates vertical guidance and predictions. The system will not allow the aircraft to descend below the next altitude constraint. If the aircraft reaches the next altitude constraint, it will level off, and the altitude constraint mode will engage.

With Resume Hold Pressed

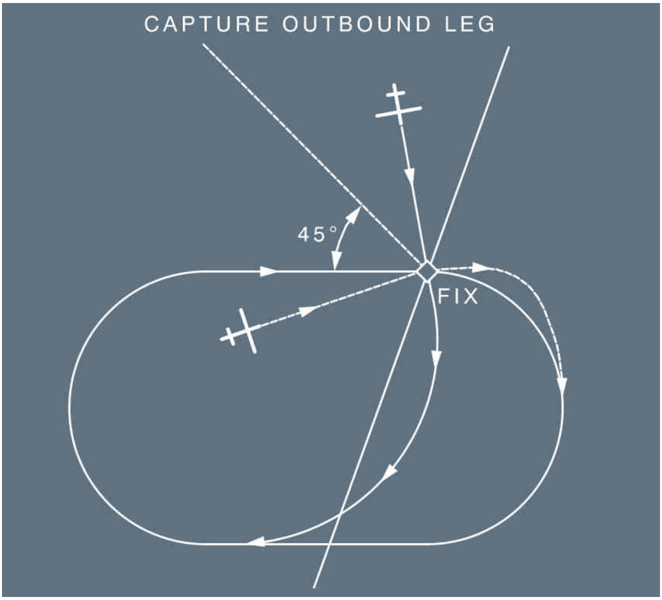
If the flight crew presses the key next to “RESUME HOLD”, the aircraft remains in the holding pattern, and the display again shows “IMM EXIT”.
After that, each time the aircraft flies over the holding fix, the system updates the predictions for one more holding circuit.

HOLDING PATTERN ENTRIES

The FMGES offers three types of entry into holding patterns:
1. Direct entry
2. Teardrop entry
3. Parallel entry

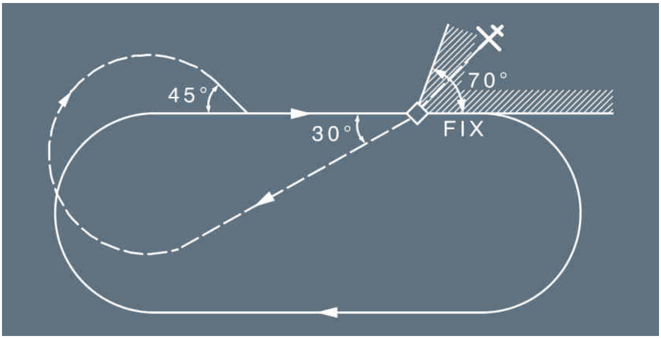


1. The Direct Entry

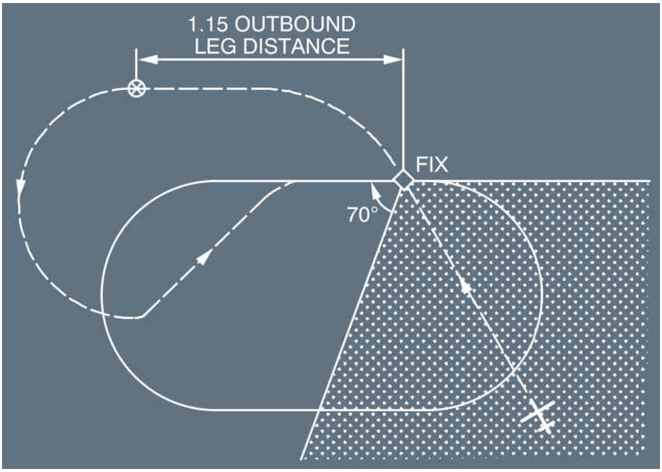


CAPTURE OUTBOUND LEG
45°
FIX

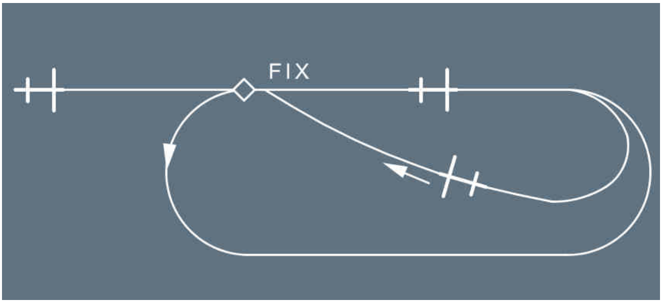
2. The Teardrop Entry



3. The Parallel Entry



Note: *If the leg the aircraft is flying toward the holding fix is on a "limit" between a teardrop entry and a parallel entry, the FMGEC may compute and display either of the two entries. The pilot should keep this in mind and not assume that the FMGEC is malfunctioning.*
If the flight plan leg toward the hold entry fix is on a course that is the reciprocal of the inbound course of the holding pattern, the aircraft will fly a parallel entry.



Ident.: DSC-22_20-30-10-15-D-00009250.0009001 / 01 OCT 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

HOLD WITH MANUAL TERMINATION (HM)

This type of holding pattern may be part of an arrival procedure, or the pilot may enter it at present position or at any flight plan waypoint.

The pilot will use this type of holding pattern to comply with a defined procedure or a clearance limit or to meet an operational need (such as losing altitude, holding for weather improvement, or absorbing an ATC delay).
This type of holding pattern is exited under pilot decision and not automatically.
There are 3 types of HM, all are modifiable.

PREDICTIONS AND GUIDANCE ASSOCIATED WITH AN HM HOLDING PATTERN (HOLD WITH MANUAL TERMINATION)

Before Deceleration

If an altitude constraint is defined at the hold entry fix, the FMGES duplicates this constraint on the hold exit.
However, different constraints may be inserted at the entry and exit fixes.
Although the hold is inserted into the flight plan, the FMGES does not take it into account for predictions until the aircraft enters the hold.
However, if the hold is not deleted by the crew, the FMGES schedules a deceleration point and displays it on the ND.

The FMGES predicts the estimated time and amount of fuel remaining at which the aircraft must exit holding so as to comply with the fuel policy specified on the fuel prediction page. When the aircraft enters the holding pattern, the FMGES revises all predictions and assumes the aircraft will fly one turn of the holding pattern.

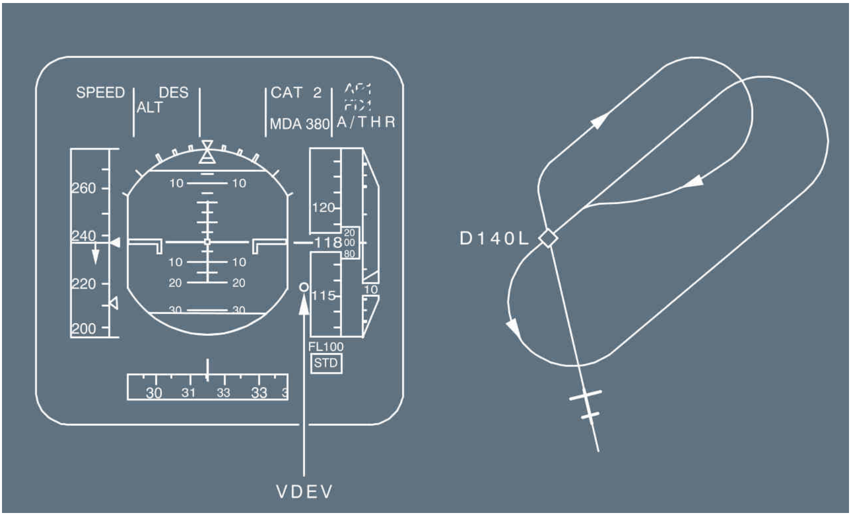
All predictions are revised if there is one additional holding pattern when the holding fix is overflown.

On Reaching the Speed Change Pseudo Waypoint

The FMGES either causes the aircraft to decelerate to the hold speed (if managed speed is active and NAV mode engaged), or displays “SET HOLD SPD” (set hold speed) on the MCDU and primary flight display if the flight crew has selected a speed target.

The default hold speed is the lowest of:
- Maximum endurance speed
- ICAO limit holding speed
- Speed constraint (if any).

When no specific speed limit applies, the default hold speed is the Maximum Endurance speed, which is approximately equal to Green Dot in clean configuration (it can vary between Green Dot and Green Dot +10 kt, depending on the aircraft weight, altitude and temperature). The flight plan predictions for time and fuel do not yet consider that the hold will be flown. However, the navigation display shows the hold entry and holding pattern trajectory.



Deceleration receives priority, so that when the aircraft is in descent with the descent mode engaged, it will deviate above the descent path to decelerate. (VDEV becomes positive on the progress page).
The flight plan page displays an immediate exit prompt.

If the flight crew presses the key next to “IMM EXIT” before arriving at the holding fix, the aircraft will not enter the holding pattern, but will resume its phase-related managed-speed profile.

PROCEDURE TO INSERT A HOLD (HOLD WITH MANUAL TERMINATION)

The HOLD prompt enables the crew to enter a holding pattern, with manual termination (HM), at the revised waypoint or at the present position.

The flight crew accesses the HOLD page from a lateral revision at the present position (PPOS) or at a waypoint.

SELECT lateral revision at present position (PPOS), or at an applicable waypoint.
PRESS the HOLD prompt [3L] key.

A TMPY F-PLN is created and if applicable, the database hold is proposed.
If no database hold is available, the computed hold is proposed.

CHECK and (if necessary) MODIFY the HOLD data
CHECK the temporary flight plan and INSERT it, if appropriate.

PROCEDURE TO DELETE A HOLD (HOLD WITH MANUAL TERMINATION)

CLEAR the HOLD directly in the flight plan as it can be done for a normal waypoint.

OFFSET

Ident.: DSC-22_20-30-10-15-E-00009253.0001001 / 14 MAY 12
Applicable to: LV-GKO, LV-GKP

The OFFSET prompt enables the crew to define a lateral offset to the left or right of the active flight plan. Once inserted, the offset applies from the present position (PPOS) all along the flight plan to the first waypoint (WPT) at which a holding pattern is defined, or to the last waypoint before the runway.
In most cases, the pilot will use it en route because of an ATC clearance or to avoid bad weather expected along the flight-plan route.
Accessed from lateral revision (LAT REV) at the present position page, an offset may be defined between 1 and 50 NM in one-nautical-mile steps.

After inserting the offset in the flight plan, the flight plan page shows OFST in its title, and the navigation display shows the offset flight plan in a solid green line and the original flight plan in a dashed green line.

The offset is cleared:
- Automatically (holding pattern, approach), or
- Manually with the clear (CLR) key.

Note: *If the crew enters an OFFSET when the aircraft is too close to the ending offset waypoint, the FMGES may refuse to accept it, in which case the MCDU displays the “ENTRY OUT OF RANGE” message.*

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The OFFSET function enables the flight crew to define a lateral offset to the left or right of the active flight plan. The offset can be immediate or deferred to start on a downstream leg. The offset will end by default or at a pre-planned end waypoint. Additionally, the flight crew can specify the intercept angle used for the transitions to and from the offset path.

In most cases, the flight crew will use it en route because of an ATC clearance or to avoid bad weather expected along the flight-plan route.
The OFFSET page is accessed from the Lateral Revision (LAT REV) page at the FROM waypoint or at any waypoint downpath the flight plan, except the destination airport.
An offset may be defined between 1 and 50 NM in one-nautical-mile steps.
After inserting the offset in the flight plan, the flight plan page shows OFST in its title, left or right arrows are displayed on every label line between the start and end waypoints of the offset, and the Navigation Display (ND) shows the offset flight plan with a solid green line and the original flight plan with a dashed green line.

The offset is cleared:
- Automatically (holding pattern, approach), or
- Manually with the clear (CLR) key, or by entering "0" in the offset value field [1L], or by using the delete prompt on the OFFSET page.

Note: *If the flight crew enters an offset when the aircraft is too close to the ending offset waypoint, the FMGES may refuse it. In that case the MCDU displays the “ENTRY OUT OF RANGE” message.*

MANUAL CANCELLATION OF OFFSET

There are two standard methods of cancelling an offset :
1. SELECT DIR TO a waypoint (the next waypoint, for example)
2. SELECT a Lateral Revision (LAT REV) at FROM WPT

CLEAR the OFFSET field.
PRESS [6R] to activate the temporary flight plan (cancelling OFFSET).

ALTERNATE FUNCTION

Ident.: DSC-22_20-30-10-15-F-00009256.0001001 / 15 FEB 11
Applicable to: ALL

The ALTERNATE FUNCTION performs two actions :
- It reviews and defines alternate airports and inserts them into the flight plan.
- It allows a diversion to be activated through the ENABLE ALTN command.

Ident.: DSC-22_20-30-10-15-F-00009257.0001001 / 14 MAY 12
Applicable to: LV-GKO, LV-GKP

REVIEW AND SELECTION OF ALTERNATE AIRPORT

Several alternate airfields may be stored in the database and assigned to a destination. When the pilot selects a company route (CO RTE) (or a city pair), the computer strings the preferred alternate into the active flight plan.
The pilot may review the alternate airports on the ALTN page, and if the one selected is not suitable because of weather or fuel considerations, another alternate may be strung into the active flight plan.
The pilot may define an additional alternate airport into the list, if necessary.

The ALTERNATE page shows the track and distance (airway or direct) between destination and alternate, as well as fuel management data (EXTRA fuel, assuming the associated airfield is the alternate airport). This data will help the pilot to change the preferred alternate, if necessary. Access the ALTERNATE page through the ALTN prompt on LAT REV page at destination. The alternate airfields are attached to the destination.

ENTERING NEW ALTERNATE INTO THE F-PLN

If the preferred alternate is not suitable, proceed as follows :

SELECT F-PLN key on MCDU
SELECT LAT REV at destination.
SELECT ALTN [5L] key.
SELECT an AIRFIELD IDENTIFIER
INSERT the temporary flight plan

Note: *If weather and destination airfield conditions allow it, you may select “NO ALTN”, fuel predictions will be computed without alternate fuel.*

SELECTION OF OTHER ALTERNATE

Fuel management information for flight to another alternate airfield may be obtained by selecting the OTHER ALTN field.

SELECT LAT REV at DESTINATION.
SELECT ALTN [5L] key.
ENTER the airfield identifier in the brackets.

- *If the airfield is not in the database, the NEW RUNWAY page automatically appears.*
- *If the airfield is in the database and there is a company route (CO RTE) to it, the ROUTE SELECTION page automatically appears.*

SELECT the route, as appropriate, or RETURN to the ALTN page.
ENTER the distance into the brackets (if required). XTRA fuel and track (TRK) will appear.
SELECT the other alternate (OTHER ALTN) as a primary alternate, if convenient. (EXTRA fuel and DIST revert to AIRWAY distance).
INSERT it, if you want to have it as a primary alternate.

Note:
- *The pilot can always overwrite the “OTHER ALTN”. The new “OTHER ALTN” then replaces the previous one, which is lost.*
- *The pilot can select OTHER ALTN as a primary alternate (active flight plan), to replace any alternate on the initial list.*
- *If the pilot selects the other alternate as a primary alternate, and overwrites the OTHER ALTN field by entering a new airport, the first one will remain a primary alternate and the system will memorize a second OTHER ALTN .*

The pilot may enter a distance in OTHER ALTN field. The system will compute the extra fuel, and the track for this distance.

PREDICTED DATA FOR ALTERNATE

Data predictions are based on :

- Aircraft weight being equal to landing weight at the primary destination.
- Flight at flight level 220, if the airway distance is less than 200 NM; otherwise, at flight level 310.
- Cost index 0
- Constant wind (as entered in the alternate field of the DES WIND page).
- Constant delta ISA (equal to delta ISA at primary destination)
- Airway distance for a company route, otherwise direct distance manually entered by the pilot in OTHER ALTN field (used only for preliminary predictions).

The pilot may enter a distance in OTHER ALTN field. The system will compute the extra fuel, and the track for this distance.

PREDICTED DATA FOR ALTERNATE

Data predictions are based on :

- Aircraft weight being equal to landing weight at the primary destination.
- Flight at FL 100, if the alternate F-PLN length is less than 100 NM; at FL 220 if the alternate F-PLN length is comprised between 100 NM and 200 NM; at FL 310 otherwise.
- Cost index 0
- Constant wind (as entered in the alternate field of the DES WIND page).
- Constant delta ISA (equal to delta ISA at primary destination)
- The along flight path distance from the destination to the alternate airport. If the flight crew enters an ALTN fuel value, this value is the one taken into account.

ENABLE ALTN

Ident.: DSC-22_20-30-10-15-00009258.0001001 / 03 MAY 23
Applicable to: ALL

This enables the flight crew to initiate a diversion by entering the alternate flight plan just after the revision waypoint (with a discontinuity).
The flight crew may have to adjust the resulting flight plan (use “direct to”, or add or suppress waypoints), depending on the circumstances.

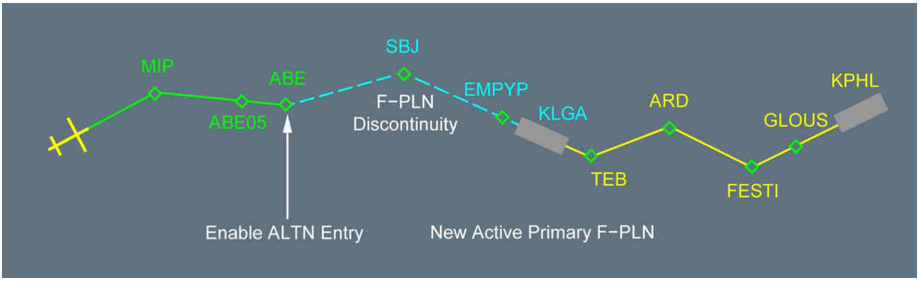
TO ACTIVATE THE PRIMARY ALTN:

SELECT a LAT REV at the TO waypoint (or at another suitable waypoint).
SELECT the ENABLE ALTN.
INSERT the temporary F-PLN.

L2 *The temporary flight plan is created and displayed.*

L1 ENTER an appropriate waypoint in DIRECT TO and adjust the flight plan.
ADJUST the cost index on the PERF page and the defaulted CRZ FL on the PROG page, as required.



When ENABLE ALTN is selected at ABE, a flight plan discontinuity is created from ABE down to destination and the alternate route is linked to the active flight plan.

DIR KEY (DIRECT-TO-FUNCTION)

Ident.: DSC-22_20-30-10-15-G-00009259.0001001 / 03 APR 18
Applicable to: ALL

GENERAL

The pilot uses the “Direct To” function to define a direct leg from the present position to any waypoint on the active flight plan or to any waypoint.
The designated waypoint may be entered by its identifier (if it is stored in the database) or by a latitude/longitude, place/bearing/distance, or a place-bearing/place-bearing.

Note: 1. *If the autopilot or flight director is in the heading/track or localizer mode, the DIR TO function engages NAV mode.*
2. *A lateral revision of the flight plan obtained with a DIR TO may also affect the vertical profile of the flight plan.*

Three functions are available through the DIR TO key :
- the DIR TO defines a direct leg from present position to a specified waypoint.
  NAV mode engages simultaneously to the DIR TO selection.
  When the pilot uses DIR TO, the present position (PPOS) becomes the “FROM” waypoint and the active flight plan shows it as T-P (turn point).
- the DIR TO/ABEAM function, defines the abeam waypoints along the direct leg. These waypoints are the projection on the direct leg of the initial F-PLN waypoints, located between the aircraft position and the specified waypoint.
  NAV mode engages simultaneously to the DIR TO/ABEAM selection.
- the DIR TO/INTCPT function allows to define a specified RADIAL INBOUND or OUTBOUND an inserted waypoint. The current aircraft track is used to compute the INTCPT point with the specified radial.
  NAV mode is armed simultaneously to the DIR TO/INTCPT selection.

The ND displays the DIR TO leg as a temporary flight plan leg, between current aircraft position and specified waypoint. In case of a DIR TO/INTCPT the leg is not displayed when the angle between the current aircraft track and the intercept radial exceeds 160 °.

Ident.: DSC-22_20-30-10-15-G-00009260.0001001 / 14 MAY 12
Applicable to: ALL

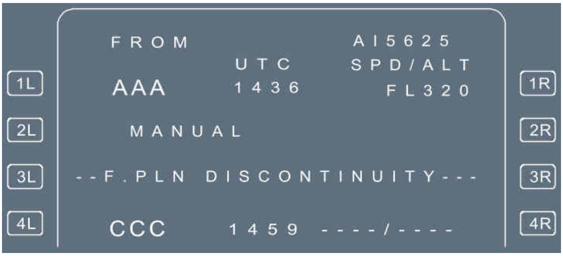
DISCONTINUITY

Clear the discontinuity and the waypoints that are not included in the new flight plan.

Ident.: DSC-22_20-30-10-15-G-00009261.0001001 / 15 FEB 11
Applicable to: ALL

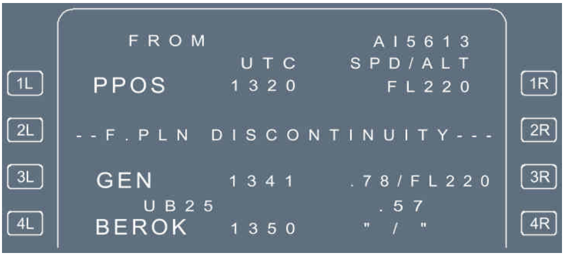
PARTICULAR CASES FOR USE OF DIR TO

- If the pilot is flying a manual leg (part of a SID or STAR), the flight plan page displays “F-PLN DISCONTINUITY”, preceded by “MANUAL” (See below).
  These legs are specific heading or track legs flown with no defined end waypoint.



```
        FROM                     AI5625
                      UTC        SPD/ALT
1L     AAA            1436         FL320     1R
2L       MANUAL                              2R
3L   --F.PLN   DISCONTINUITY---              3R
4L     CCC          1459    ----/----        4R
```

- When the pilot encounters a flight plan discontinuity, or if a major reset occurs, the flight plan page displays “PPOS - F-PLAN DISCONTINUITY”, and the pilot looses managed guidance in both the lateral and vertical plans.
  The autopilot or flight director reverts to the basic HDG V/S (or TRK FPA) modes. Predictions remain available and are based on the assumption that the aircraft will fly a direct leg from its present position to the next waypoint.



```
          FROM                   AI5613
                      UTC        SPD/ALT
1L     PPOS           1320         FL220     1R
2L   --F.PLN   DISCONTINUITY---              2R
3L     GEN            1341      .78/FL220    3R
            UB25                  .57
4L     BEROK          1350       "  /  "     4R
```

- **In both of these cases, the only way to get back to a standard flight plan is to perform a “DIR TO” a designated waypoint.**

Note: *During cruise, the DIR TO function is not available as long as uplink wind data, received through ACARS ◁ or ATSU ◁ , is not inserted or cancelled on the CRUISE WIND page.*

Ident.: DSC-22_20-30-10-15-G-00009262.0001001 / 11 MAR 13

PROCEDURE FOR DIR TO/ABEAM

Example : DIR TO/ABEAM to BEROK

PRESS the DIR key on the MCDU.
WRITE the waypoint identifier in the scratchpad (Here : BEROK).
PRESS [1 L] to enter the waypoint in the DIR TO field.
SELECT the ABEAM PTS function

The display reverts to F-PLN A page.

PROCEDURE FOR DIR TO/INTERCEPT

PRESS the DIR key.
WRITE the waypoint identifier in the scratchpad.
PRESS [1L] to enter the waypoint in the DIR TO field.

In the [1R] and [2R] field, the MCDU displays the functions radial inbound and radial outbound from the waypoint.
If the waypoint belongs to the flight plan, the system displays the track of the flight plan as defaulted radial inbound. The crew can modify it.

WRITE the required in or out radial in the scratchpad.
PRESS [1R] or [2R] key to enter the radial in the required field.

The ND displays the entered radial in amber dotted line : the pilot can still modify it.

PRESS [1R] or [2R] key to confirm the DIR TO/INTERCEPT selection.

The display reverts to F-PLN A page, the system arms the NAV mode, and engages HDG mode. The FROM waypoint is the aircraft position at the time of the DIR TO/INTERCEPT selection. The MCDU indicates it as INBND or OUTBND.

Note: 1. *If the waypoint does not belong to the flight plan, the system strings the DIR TO/INTERCEPT leg to this waypoint, and inserts a discontinuity following the waypoint.*
2. *A DIR TO/INTERCEPT cancels any active offset.*
3. *If the current AP/FD lateral mode is HDG or TRK, NAV becomes armed.*
If the NAV mode was engaged, NAV becomes armed. FCU HDG or TRK must be used to guide the aircraft.
The ND displays an intercept point, if the intercept angle is less than 120 °. The system constantly updates it to reflect the current aircraft track and position with respect to the intercept radial. The NAV mode engages when reaching the intercept point.

POSITION UPDATE AT

Ident.: DSC-22_20-30-10-15-00009265.0003001 / 05 MAR 19
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

To manually change the position computed by the FMGEC (FM position and bias), the pilot uses “POSITION UPDATE AT” on the progress page.
Use this facility with extreme caution: It is apt to be inaccurate, because it relies on the pilot’s estimation of when a designated position has been reached.

WRITE the identifier for the navaid (or waypoint, or airport), or the coordinates, or the PBD or PB/PB at which an update is intended.
Press [3L] to ENTER the ident in the “POSITION UPDATE AT” field. The coordinates of the point, along with its identifier (or “ENTRY” if the identifier is not in the database), appear in that field.
PRESS [3R] to activate the update when you estimate that you are at the position.

Note: *The system reinitializes the Estimated Position Error computation when a position update is performed. This may lead to the appearance of a “NAV ACCUR DOWNGRAD” or “NAV ACCUR UPGRAD” message.*

If the “POSITION UPDATE AT” does not take effect properly, it corrupts the FM position.

- In an area with good radio navaid coverage :
  - If the update error is small, subsequent radio position updating will correct the FM position.
  - If the update error is large, the system will reject any radio updating because its internal “reasonableness test” will reject the various navaids. Thus the FM position will only be the MIX IRS position corrected by the position bias determined at the time of the update, and the error will be maintained.
- In an area without proper navaid coverage, radio position updating will not be available and the FM position, if incorrect, will remain incorrect until a new manual update is performed.
- Therefore, the pilot should use “POSITION UPDATE AT” only in case of a major position problem such as:
  - on the ground, no flight plan appears on the navigation display and ARC/ROSE NAV mode is selected.
  - A “CHECK A/C POSITION” message appears and the position monitor page indicates an obvious position mismatch.
  - A “CHECK IRS/FM POSITION” message appears on the MCDU.
  - A “FM/IR POSITION DISAGREE” message appears on the ECAM.

When the GPS PRIMARY ◁ is operative, the "POSITION UPDATE AT" is inhibited.

UPDATE AT

Ident.: DSC-22_20-30-10-15-00009265.0001001 / 05 MAR 19
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

To manually change the position computed by the FMGEC (FM position and bias), the pilot uses “UPDATE AT” on the progress page.
Use this facility with extreme caution: It is apt to be inaccurate, because it relies on the pilot’s estimation of when a designated position has been reached.

WRITE the identifier for the navaid (or waypoint, or airport), or the coordinates, or the PBD or PB/PB at which an update is intended.
Press [3L] to ENTER the ident in the "UPDATE AT" field. The coordinates of the point, along with its identifier (or "ENTRY" if the identifier is not in the database), appear in that field.
PRESS [3R] to activate the update when you estimate that you are at the position.

Note: *The system reinitializes the Estimated Position Error computation when a position update is performed. This may lead to the appearance of a "NAV ACCUR DOWNGRAD" or "NAV ACCUR UPGRAD" message.*

If the "UPDATE AT" does not take effect properly, it corrupts the FM position.

- In an area with good radio navaid coverage :
  - If the update error is small, subsequent radio position updating will correct the FM position.
  - If the update error is large, the system will reject any radio updating because its internal “reasonableness test” will reject the various navaids. Thus the FM position will only be the MIX IRS position corrected by the position bias determined at the time of the update, and the error will be maintained.
- In an area without proper navaid coverage, radio position updating will not be available and the FM position, if incorrect, will remain incorrect until a new manual update is performed.
- Therefore, the pilot should use “UPDATE AT” only in case of a major position problem such as:
  - on the ground, no flight plan appears on the navigation display and ARC/ROSE NAV mode is selected.
  - A “CHECK A/C POSITION” message appears and the position monitor page indicates an obvious position mismatch.
  - A “CHECK IRS/FM POSITION” message appears on the MCDU.
  - A “FM/IR POSITION DISAGREE” message appears on the ECAM.

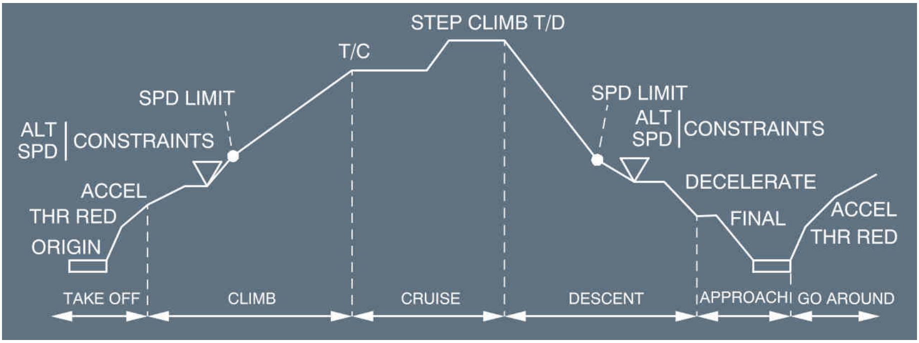
When the GPS PRIMARY ◁ is operative, the FM position will always converge towards the GPS position at a rate depending on the aircraft altitude. Therefore when GPS PRIMARY is operative, an “update at” that is inaccurate will have a temporary effect on the FM position.

General

GENERAL

Ident.: DSC-22_20-30-20-05-00011409.0001001 / 14 MAY 12
Applicable to: ALL

The vertical flight plan is divided into the following flight phases:
Preflight - Takeoff - Climb - Cruise - Descent - Approach - Go-Around - Done.
All but “Preflight” and “Done” phases are associated with speed and altitude profiles.



Each phase has an assigned profile of target speeds. For each phase the FMGES computes an optimum (ECON) speed as a function of the strategic parameters (CI, CRZ FL, ZFW, ZFWCG, block FUEL, winds and temperature) and performance criteria.
ECON speed is the basis of the managed speed profile.

The ECON speed can be modified by:
- Presetting a speed or Mach number on the MCDU (PERF page) for the next phase
- Selecting on the FCU a speed or a Mach number for the active phase
- Inserting speed constraints or speed limits on the MCDU vertical revision (VERT REV) page.

The vertical flight plan includes vertical constraints (altitude, speed, time) that may be stored in the data base or entered manually by the flight crew through vertical revision pages.
The flight crew may also define step climbs or step descents for cruise purposes. If the flight crew plans to climb to a higher flight level or descend to a lower level, they can use a vertical revision at any waypoint to insert the new level.
When all the vertical data has been defined, the FMGEC computes the vertical profile and the managed speed/Mach profile from takeoff to landing.

VERTICAL FLIGHT PLANNING

Ident.: DSC-22_20-30-20-05-00011410.0003001 / 17 MAR 11
Applicable to: ALL

DATA ENTRY

The vertical flight plan provides the FMGES with all the data required to calculate performance and predictions. This data is either entered by the flight crew or calculated by the FMS.

There are three categories of data:

- Strategic data, that applies to the overall flight profile:
  - Cost Index (CI)
  - Cruise Flight Level (CRZ FL) and STEP ALTS, if any
  - Zero-Fuel Weight (ZFW)
  - Zero-Fuel Weight Center of Gravity (ZFWCG)
  - Block Fuel.
- Weather data (data entered by the flight crew or measured data):
  - Winds (for climb, cruise, descent, approach)
  - Sea level atmospheric pressure (QNH) at destination
  - Surface temperature (TEMP) at destination
  - Temperature in cruise phase
  - The Tropopause altitude (TROPO).
- Tactical data for the flight phases:
  - Phase switching conditions:
    - Setting of the thrust levers to TOGA or FLEX positions
    - Reaching acceleration altitude (ACCEL ALT)
    - Entering cruise (T/C)
    - Initiation of descent (T/D)
    - Passing a deceleration pseudo waypoint (DECEL PSEUDO WPT)
    - Touchdown.
  - Speed profile:
    - V2
    - Economy climb speed or Mach (ECON CLB SPD/MACH)
    - Preselected speed or Mach (SPD/MACH PRESELECTION)
    - Economy cruise Mach (ECON CRZ MACH)
    - Constant Mach
    - Economy descent Mach or speed (ECON DES MACH/SPD)
    - Approach speed (VAPP).
  - Vertical limitations:
    - Speed limits (SPD LIMIT)
    - Speed and altitude constraints (SPD AND ALT CSTR)
    - Time constraint or Required Time of Arrival (RTA).

In addition to data entered by the flight crew, the FMS uses some real flight data parameters (CRZ SAT, actual wind) to improve the accuracy of the computed predictions.

FLIGHT PHASES

Ident.: DSC-22_20-30-20-05-00016084.0006001 / 25 MAY 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

The vertical flight plan is divided into flight phases. For each phase, the FMGES computes the optimum speed or Mach Profile. These flight phases are:
Preflight - Takeoff - Climb - Cruise - Descent - Approach - Go-Around - Done.

FLIGHT PHASES	OPTIMUM SPEED PROFILE	SWITCHING CONDITIONS TO NEXT PHASE
PREFLIGHT	-	SRS takeoff mode engaged and N1 is more than 85 % (EPR is more than or equal to 1.25) or Ground Speed is more than 90 kt
TAKEOFF	V2 (V2+10 kt)	At acceleration altitude or by engagement of another vertical mode
CLIMB	ECON CLB SPD / MACH	Reaching cruise flight level
CRUISE	ECON CRZ MACH	No step descent, and distance to destination is less than 200 NM, or all engines are operative and selected altitude below Max [FL 200, highest DES ALT CSTR]
DESCENT	ECON DES MACH / SPD	- Overflying (DECEL) pseudo waypoint with NAV (or LOC*/LOC or F-LOC* ◁ /F-LOC ◁) mode engaged, or - Manual activation of the approach phase.
APPROACH	VAPP (GS Min)	1. To Go-Around: when thrust levers at TOGA detent, or 2. To Done: 30 s after landing, or 3. To Climb: when inserting a new CRZ FL
GO-AROUND	VAPP or current SPD whichever is higher. Green Dot at acceleration altitude.	1. To Approach: Manual activation of the approach phase, or 2. To Climb: Above acceleration altitude by - Selecting ALTN, or - Inserting NEW DEST.
DONE	-	To preflight: when INIT or PERF key is pressed

Note: *During the preflight phase, the flight crew inserts the flight plan which includes all data needed for the flight.*
During the Done phase, the FMGES erases the data entered for the flight. If the Descent or the Approach phase is inadvertently activated (e.g. manual approach phase activation), the flight crew may reselect a CRZ FL on the PROG page to reactivate the Cruise phase.

FLIGHT PHASES

Ident.: DSC-22_20-30-20-05-00016084.0001001 / 27 FEB 18
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

The vertical flight plan is divided into flight phases. For each phase, the FMGES computes the optimum speed or Mach Profile. These flight phases are:
Preflight - Takeoff - Climb - Cruise - Descent - Approach - Go-Around - Done.

FLIGHT PHASES	OPTIMUM SPEED PROFILE	SWITCHING CONDITIONS TO NEXT PHASE
PREFLIGHT	/	SRS takeoff mode engaged and N1 > 85 % (EPR ≥ 1.25) or Ground Speed > 90 kt
TAKEOFF	V2 (V2+10)	At acceleration altitude or by engagement of another vertical mode.
CLIMB	ECON CLB SPD / MACH	Reaching cruise FL
CRUISE	ECON CRZ MACH	No step descent, and distance to destination < 200 NM, or all engine operative and selected altitude below Max [FL 200, highest DES ALT CSTR]
DESCENT	ECON DES MACH / SPD	- Overflying (DECEL) pseudowaypoint with NAV (or LOC*/LOC or F-LOC*/F-LOC ◁*) mode engaged and altitude < 7 200 ft AGL (9 500 ft AGL for FMS R1A and subsequent). - Manual activation of the approach phase.
APPROACH	VAPP (GS Min)	1. To Go-Around: when thrust levers at TOGA detent, or 2. To Done: 30 s after landing, or 3. To Climb: when inserting a new CRZ FL
GO-AROUND	VAPP or current SPD whichever is greater. Green Dot at ACC ALT	1. To Approach: Manual activation of the approach phase, or 2. To Climb: Above acceleration altitude by - Selecting ALTN, or - Inserting NEW DEST
DONE	/	To preflight: when INIT or PERF key depressed.

Note: *During the preflight phase, the flight crew inserts the flight plan, which includes all data needed for the flight.*
During the done phase, the FMGEC erases the data entered for the flight. If the descent or the approach phase is inadvertently activated (manual approach phase activation, for example), the flight crew may reselect a CRZ FL on the PROG page to reactivate the CRZ phase.

VERTICAL REVISION

Ident.: DSC-22_20-30-20-05-00011412.0003001 / 01 OCT 12
Applicable to: ALL

The flight crew uses vertical revisions to enter or modify:
- The speed limit in the climb and descent phases
- An altitude or speed constraint at the revised waypoint
- A step climb or a step descent
- New wind data
- A time constraint.

The vertical revision page is accessed by pressing a right hand select key of the flight plan page.

VERTICAL CONSTRAINTS (SPEED, ALTITUDE, TIME)

Ident.: DSC-22_20-30-20-05-A-00011413.0005001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

The flight crew enters speed, altitude and time constraints, either to comply with ATC requests and specified procedures, or at the discretion of the flight crew, in response to operational variables.

SPEED LIMIT

A speed limit is associated with altitude as a maximum speed below a specified altitude (only one in climb and one in descent).

ALTITUDE CONSTRAINT

Altitude constraints may be attached to specific waypoints in the climb, descent, or approach phases.
To meet the altitude constraint, the aircraft must fly over the waypoint at an altitude equal, above or below the altitude constraint as specified by the flight crew or the database.

Note: *The database may contain an altitude constraint window (two altitudes between which the aircraft must fly passing over a given waypoint), but the flight crew cannot enter such a constraint manually.*

An altitude constraint is considered as missed if the system predicts more than 250 ft of difference between the constraint value and the predicted aircraft altitude.
Altitude constraints are observed in CLB or DES or APP NAV-FINAL modes.

The FMS automatically deletes from the F-PLN:
- The altitude constraints (AT, AT OR ABOVE or AT OR BELOW) with values greater than the CRZ FL
- The upper constraint of altitude constraint windows with the upper constraint greater than the CRZ FL.

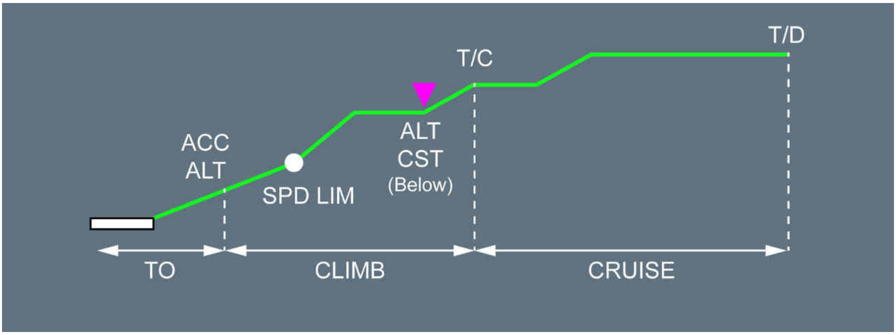
The MCDU and the ND no longer display the deleted altitude constraints. These altitude constraints are no longer used for the computation of the FMS climb and descent profile.
In that case, the scratchpad of the MCDU displays the CSTR DEL ABOVE CRZ FL message.
The FMS does not delete the altitude constraints at the CRZ FL. The FMS computes the T/D, in order to respect these altitude constraints. However these altitude constraints are not used for guidance. If the flight crew initiates the descent before reaching the T/D, the aircraft descents below the altitude constraints, and the altitude constraints are missed (amber on the MCDU and on the ND).

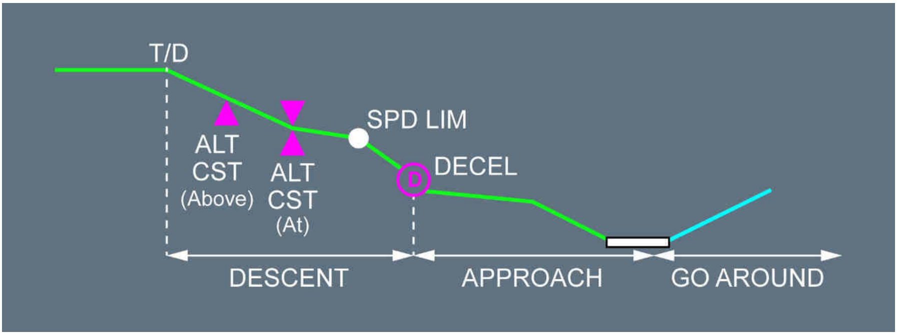
Ident.: DSC-22_20-30-20-05-A-00011413.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP

The flight crew enters speed, altitude and time constraints, either to comply with ATC requests and specified procedures, or at the discretion of the flight crew, in response to operational variables.

SPEED LIMIT

A speed limit is associated with altitude as a maximum speed below a specified altitude (only one in climb and one in descent).





ALTITUDE CONSTRAINT

Altitude constraints may be attached to specific waypoints in the climb, descent, or approach phases.
To meet the altitude constraint, the aircraft must fly over the waypoint at an altitude equal, above or below the altitude constraint as specified by the flight crew or the database.

Note: *The database may contain an altitude constraint window (two altitudes between which the aircraft must fly passing over a given waypoint), but the flight crew cannot enter such a constraint manually.*

An altitude constraint is considered as missed if the system predicts more than 250 ft of difference between the constraint value and the predicted aircraft altitude.
Altitude constraints are observed in CLB, or DES, or APP NAV-FINAL modes.

The FMS automatically deletes from the F-PLN:
- The altitude constraints (AT, AT OR ABOVE, or AT OR BELOW) with values equal to the CRZ FL, or greater than the CRZ FL
- The altitude constraint windows with the upper constraint equal to the CRZ FL, or greater than the CRZ FL.

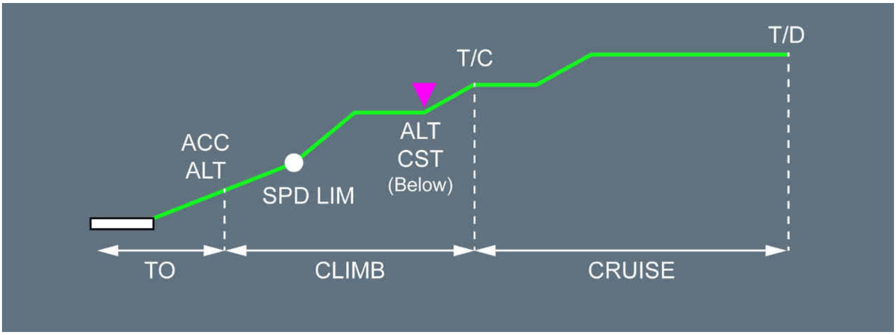
The MCDU and the ND no longer display the deleted altitude constraints. These altitude constraints are no longer used for the computation of the FMS climb and descent profile.
In that case, the scratchpad of the MCDU displays the CSTR DEL ABOVE CRZ FL message.

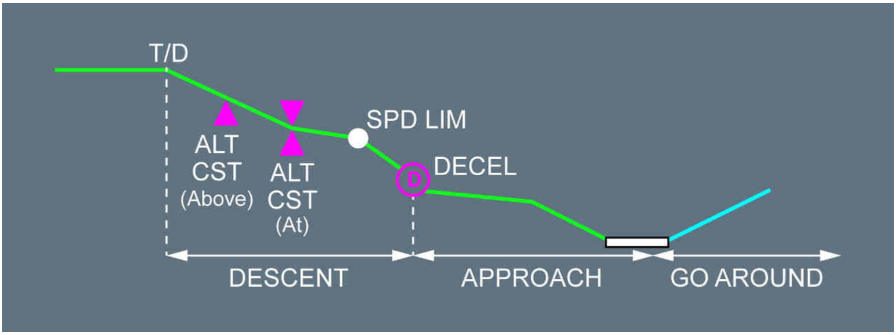
Ident.: DSC-22_20-30-20-05-A-00011413.0004001 / 03 NOV 23
Applicable to: LV-KHT, LV-KHU

The flight crew enters speed, altitude and time constraints, either to comply with ATC requests and specified procedures, or at the discretion of the flight crew, in response to operational variables.

SPEED LIMIT

A speed limit is associated with altitude as a maximum speed below a specified altitude (only one in climb and one in descent).





ALTITUDE CONSTRAINT

Altitude constraints may be attached to specific waypoints in the climb, descent, or approach phases.
To meet the altitude constraint, the aircraft must fly over the waypoint at an altitude equal, above or below the altitude constraint as specified by the flight crew or the database.

Note: *The database may contain an altitude constraint window (two altitudes between which the aircraft must fly passing over a given waypoint), but the flight crew cannot enter such a constraint manually.*

An altitude constraint is considered as missed if the system predicts more than 250 ft of difference between the constraint value and the predicted aircraft altitude.
Altitude constraints are observed in CLB or DES or APP NAV-FINAL modes.

The FMS automatically deletes from the F-PLN:

- The altitude constraints (AT, AT OR ABOVE, or AT OR BELOW) with values greater than the CRZ FL
- The altitude constraint windows with the upper constraint greater than the CRZ FL.

The MCDU and the ND no longer display the deleted altitude constraints. These altitude constraints are no longer used for the computation of the FMS climb and descent profile.
In that case, the scratchpad of the MCDU displays the CSTR DEL ABOVE CRZ FL message.
The FMS does not delete the altitude constraints at the CRZ FL. The FMS computes the T/D, in order to respect these altitude constraints. However these altitude constraints are not used for guidance. If the flight crew initiates the descent before reaching the T/D, the aircraft descents below the altitude constraints, and the altitude constraints are missed (amber on the MCDU and on the ND).

Ident.: DSC-22_20-30-20-05-A-00026431.0001001 / 03 NOV 23
Applicable to: ALL

SPEED CONSTRAINT

Speed constraints are managed by the FMS when:

- The NAV mode is engaged, and
- The speed target is managed, and
- The speed constraint is equal or above the maneuvering speed.

In all other cases, the speed constraints are disregarded.

TIME CONSTRAINT

Time constraint may be attached to any waypoint except the FROM waypoint.

Note: *No constraint can be associated with go-around waypoints.*

Intentionally left blank

TIME CONSTRAINT/RTA

Applicable to: ALL

Ident.: DSC-22_20-30-20-25-A-00008899.0001001 / 15 FEB 11

GENERAL

A Required Time of Arrival (RTA) is a time requirement to be met over a specified waypoint of the lateral flight plan, including destination but excluding the origin and FROM waypoints. When the predictions are available, the time constraint value is replaced by the predicted time at the related waypoint, highlighted by a star (*):

- **if the RTA is predicted as matched,**

  the star (*) is magenta
- **if the RTA is predicted as missed**

  the star (*) is amber.

No specific symbol is provided on the ND.
A time constraint is cleared in the same way as any other constraints. If a time constraint is automatically deleted, the MCDU displays an “RTA DELETED” message.

Ident.: DSC-22_20-30-20-25-A-00008900.0001001 / 22 MAR 16

ENTERING A REQUIRED TIME OF ARRIVAL

SELECT the F-PLN key on MCDU

WIND - TEMPERATURE - QNH

Ident.: DSC-22_20-30-20-25-B-00008910.0001001 / 15 FEB 11
Applicable to: ALL

GENERAL

In order to receive the best predictions, the pilot must enter wind and temperature values for the different phases and for various waypoints of the cruise phase.
The system uses the temperature value at a given altitude, associated with the tropopause as entered on the INIT A page to optimize the temperature profile.

Ident.: DSC-22_20-30-20-25-B-00008913.0003001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

ENTERING THE TRIP WIND AND TEMPERATURE DURING THE F-PLN INITIALIZATION

The trip wind is a mean wind component for the entire flight from origin to destination. The flight crew can enter it before engine start on the INIT FUEL PRED page. It is usually defined by the airlines flight operations on the computerized flight plan.
The FMGES does not consider the trip wind for alternate predictions.
The trip wind is used as long as no winds are entered in the CLIMB WIND, CRUISE WIND and DESCENT WIND pages.
When the flight crew enters a CLB, CRZ or DES wind, the FMGES disregards the trip wind.

PRESS the INIT key.
INSERT the temperature at cruise FL.
On the INIT FUEL PRED page INSERT the TRIP WIND.
The trip wind is defined as a headwind component (HDXX, XXHD or - XX), or as a tailwind (TLXX, XXTL or + XX).
The FMGES uses the trip wind to compute preliminary performance, time and fuel predictions.
CHECK the predictions on the F-PLN B page.
For the ALTN F-PLN, an average wind may be entered on the DESCENT WIND page for alternate cruise flight level.

Note: *Wind can be automatically received (and inserted) through ACARS system* ◁ .

When a CLB, CRZ or DES wind is entered, the system ignores the TRIP WIND. When temperature and winds are inserted, the FMGES computes the ISA profile, and the F-PLN B page displays the forecast wind profile (by linear interpolation and propagation).

ENTERING THE WIND AND TEMPERATURE DURING F-PLN INITIALIZATION

When completing the INIT A page and once the wind and cruise FL temperature forecasts are available, the pilot may enter them, if significantly different, by pressing the wind prompt.
He will access the different wind pages using NEXT PHASE key and PREV PHASE key. He will slew the CRZ WIND page to access the various waypoints of the cruise winds.

The pilot will enter wind data as follows:
- For climb phase; by inserting either the HISTORY WIND data (as recorded during the last descent) or by inserting winds (at up to 5 altitudes) on the CLIMB WIND page.
- for cruise phase; by inserting winds (at up to 4 FL) at various CRZ waypoints on the CRZ WIND pages. The 4 levels are the same for all the cruise waypoints. The pilot may enter the temperature of each waypoint and at destination on this page.
- For descent phase; by inserting winds (at up to 5 FL/altitudes) on the DES WIND page.
- For the ALTN F-PLN, an average wind may be entered on the DES WIND page for alternate cruise flight level.

Note: *Wind can be automatically received (and inserted) through ACARS system ◁ .*

Once a CLIMB, CRZ or DESCENT WIND is entered, the system ignores the TRIP WIND.
Once temperature and winds are inserted, the FMGES computes the ISA profile, and the F-PLN B page displays the forescast wind profile (by linear interpolation and propagation).

WIND ENTRY RULES

When from an empty field, a wind entry is performed, direction/velocity/altitude (or flight level) must be entered simultaneously. One entry in each bracket.
Overwriting a wind cancels the previous one.
Entered wind data can be cleared, the field reverts to brackets. Propagated wind cannot be cleared.
Entering a new altitude over an existing altitude replaces that existing altitude at all cruise waypoints. Any winds entered at the overwritten altitude are lost at all cruise waypoints.

ENTERING THE HISTORY WIND (F-PLN INITIALIZATION)

The pilot may insert the history wind but cannot modify this page.
If convenient, PRESS the (6R) prompt to insert. After insertion, the [6R] prompt is suppressed but the page still displays the wind values for information.

ENTERING THE CLIMB WIND (F-PLN INITIALIZATION)

If history winds are not convenient.

SELECT CLIMB WIND page from INIT A page or VERT REV page.

WRITE new winds into the scratchpad and ENTER.

Winds entered on CLIMB, CRZ and DESCENT WIND pages are always true North referenced.
Tower wind entered on PERF is magnetic referenced.
The pilot can enter “GRND” in the altitude field for wind at destination.
CLIMB WIND cannot be modified when the climb phase is active.
At climb phase transition, wind data switches from blue to green colour and any attempted modification will trigger the “NOT ALLOWED” message.
The system extrapolates the highest wind entry to all higher levels.
The system interpolates winds between 2 entered levels.

ENTERING THE CRUISE WINDS AND TEMPERATURES

At flight plan initialization, the CRZ WIND page displays all cruise waypoints with empty brackets. In flight, only downpath waypoints are displayed.

SELECT VERT REV at WPT.
PRESS the WIND prompt.
SELECT NEXT PHASE.
SLEW until relevant waypoint is displayed.
WRITE and ENTER the new temperature into the scratchpad.
WRITE and ENTER the new wind data into the scratchpad.

WIND and temperature may be entered through ACARS pages. If ACARS is installed.

The crew should modify the entered winds and temperatures in flight, if a significant difference is expected (greater than 30 kt or 30 ° for the wind data and greater than 5 °C for the temperature).
The FMS propagates the crew (or ACARS) wind and temperature entries downpath, until a waypoint for which a different temperature or wind has been entered (for the same flight level), or until the last cruise waypoint.
The forecast winds at a waypoint are determined as follows:

- **If the predicted altitude at the waypoint matches an altitude defined in the CRUISE WIND page,** the forecasted wind is the corresponding entered or propagated wind, displayed at that waypoint on the CRUISE WIND page.

- **If the predicted altitude lies between two altitudes entered on the CRUISE WIND page,** the wind direction and velocity are linearly interpolated.

- **If the predicted altitude is above or below the set of CRUISE altitudes,** the forecasted wind is a constant value extrapolated from the entered or propagated wind at the highest (or lowest) altitude displayed on the CRUISE WIND page for that point.

Once in flight, the FMGES considers the real, measured wind up to 200 NM ahead of the aircraft, to permanently update the wind profile. This updated wind profile is used to compute the predictions and the performance data, but is not displayed to the crew.
The CRZ WIND pages display the propagated values in small blue font, and the crew (or ACARS) entries in large blue font.

Note: *The CRZ WIND page displays ACARS ◁* or crew entered data. It never displays computed or propagated data (F-PLN B page only).*

EFFECT OF WIND ENTRIES ON OPTIMUM FLIGHT LEVEL

The computation of the OPT FL considers the wind entries made at the different altitudes (normally at the different CRZ FL).
When flying the subsequent CRZ FL, the OPT FL proposed by the PROG page may be affected by the wind entries made at the previous CRZ FL ; these winds are propagated automatically and may be significantly different from the actual winds.
We recommend the following procedure : if the propagated winds at the lower altitudes are significantly different from the actual winds, enter the wind at these altitudes or if not available, the wind measured at the current CRZ FL.

ENTERING THE DESCENT WINDS

The flight crew will enter as many as one wind at 5 different FL or altitudes. This wind data will be used for descent profile and prediction computation.
From the vertical revision page, or from the CRZ WIND page:

PRESS the WIND prompt.
SELECT the DESCENT WIND page.

ENTER up to 5 different “wind/altitude”.

A wind is written as true direction/velocity/flight level or altitude in feet.
If the flight crew enters “GRND” in the altitude field, the system uses the associated wind as wind at destination.
The descent profile is corrected, as well as the tower wind entered in the PERF APPR page. (The wind direction is then modified of the magnetic variation, if the airfield is magnetic North referenced).

When the winds have been entered, the F-PLN B page displays the forecast wind profile at all descent waypoints, using values it has interpolated from manual entries. Descent winds are not modifiable when the descent, approach or go-around phase is active. At descent phase transition, wind data switch from blue to green, and any attempted modification triggers the “NOT ALLOWED” message.

Ident.: DSC-22_20-30-20-25-B-00008930.0001001 / 15 FEB 11
Applicable to: ALL

ENTERING THE ALTERNATE WIND

Alternate wind is entered on the DESCENT WIND page. If an ALTN wind is not defined, the predictions are computed with a wind defaulted to zero. Alternate wind can be modified at any time. In addition, the alternate cruise (ALTN CRZ) level defaults to:

- FL 220, if the length of the alternate flight plan (ALTN F-PLN) is less than 200 NM.
- FL 310, if the length of the ALTN F-PLN is greater or equal to 200 NM.

The ALTN wind profile is as follows:

- ALTN CLB wind	:	Mean wind between ALTN CRZ wind, as entered on the DESCENT WIND page, and the wind at primary DEST, as entered on the PERF APPR page.
- ALTN CRZ wind	:	If no ALTN WIND has been entered on the DESCENT WIND page, the WIND at primary DEST (as entered on the PERF APPR page) is considered. In case of no entry by the flight crew, zero wind is assumed.
- ALTN DES wind	:	Mean wind between ALTN CRZ WIND and wind at FL 100. Wind at FL 100 = interpolation between wind at ALTN CRZ FL and zero at ALTN DEST.

Ident.: DSC-22_20-30-20-25-B-00008932.0001001 / 01 OCT 12
Applicable to: ALL

ENTERING THE APPROACH WIND TEMPERATURE AND QNH

The wind at destination is entered on the PERF APPR page, in the 3L field. If the airport is magnetic North-referenced, the PERF APPR page displays MAG WIND. If the airport is true North-referenced, the PERF APPR page displays TRUE WIND.
The wind entry is copied into the true wind reference on the DESCENT WIND page, at ground level (GRND), and the F-PLN B page, at destination. A ground entry, on the DESCENT WIND page, is in the same way, automatically copied to the F-PLN B page and the PERF APPR page (magnetic or true, depending on the airfield reference).
The wind is modifiable in the descent, approach, and go-around phases.

SELECT the PERF key on the MCDU
PRESS the NEXT PHASE key (6R)
WRITE QNH and temperature and enter them.
WRITE the surface wind (magnetic or true, depending on the airport reference) into the scratchpad and enter it.

Note: *At each wind entry, the descent profile is recomputed, therefore it is recommended to enter all winds, temperature and QNH at the same time to minimize recomputation time.*

CONSTANT MACH SEGMENT

Applicable to: ALL

Ident.: DSC-22_20-30-20-25-C-00008934.0001001 / 15 FEB 11

GENERAL

The pilot can enter the start and end points of a constant Mach segment, and its associated Mach number from the VERT REV page.

Only one Constant Mach segment may be defined in the active flight plan, and one in the secondary flight plan. No Constant Mach segment can be defined in the alternate flight plan.

Ident.: DSC-22_20-30-20-25-C-00008936.0001001 / 14 MAY 12

ENTERING A CONSTANT MACH SEGMENT

SELECT the F-PLN key on MCDU.
SELECT a VERT REV at revised waypoint

(except destination and alternate flight plan waypoint).

WRITE the Mach/start waypoint pair.

It is possible to enter only the Mach or the waypoint. But, for the first entry, a Mach entry is mandatory.
The waypoint must be located in front of the aircraft and must be part of the cruise.

ENTER it in 4L field

The END WPT prompt appears in the 4R field.

GENERAL

Ident.: DSC-22_20-40-10-00012240.0001001 / 18 AUG 10
Applicable to: ALL

The performance function:
- Optimizes a flight plan
- Computes predictions.

OPTIMIZATION

Ident.: DSC-22_20-40-10-00012241.0001001 / 18 FEB 15
Applicable to: LV-GKO, LV-GKP

The FMGEC minimizes cost by optimizing the following items:
- Takeoff, approach, and go-around speeds (F, S, Green Dot, VAPP)
- Target speed for CLB, CRZ and DES phases (ECON SPD/MACH)
- Flight Level (for flight crew's information)
- Descent profile from CRZ FL down to the destination airport.

These items depend on the data the flight crew inserts during lateral and vertical flight planning and revision procedures.
Most are displayed on the PERF pages associated with the appropriate flight phases.

WIND PROFILE

To obtain the best predictions, the flight crew must enter the wind for the various flight phases and specifically for waypoints in cruise.

■ **ON GROUND:**
During flight planning initialization, enter the winds for the climb and cruise phases using the HISTORY WIND and WIND pages. Enter manually or with ACARS, different wind values in the climb and cruise phases. The system will compute a wind for all waypoints of the F-PLN using linear interpolation between manual/ACARS entries.
The wind profile will be displayed on the F-PLN B page, and is called forecast wind profile. Flight crew or ACARS entries are displayed in large font, and system-computed winds in small font.

■ **IN FLIGHT:**
The system updates the predictions and the current ECON speed, using the measured wind at the present position. It combines actual wind and forecast winds to compute the wind ahead of the aircraft, but this is totally transparent to the flight crew.
During cruise, the flight crew will enter the descent winds and the approach wind. The system will update the final predictions, compute the optimum descent profile and compute the optimum speed in descent and approach.

The forecast wind profile will be used to compute fuel and time predictions, as well as ECON speed/Mach targets.

OPTIMUM TAKEOFF, APPROACH AND GO-AROUND SPEEDS

The FMGEC computes takeoff speeds (F, S, Green Dot) during the preflight and takeoff phases, using the performance model in the database and the takeoff weight.
The flight crew has to insert V1, VR, and V2 in the PERF TO page manually.
The FMGEC uses the performance model and either the predicted landing weight or the current gross weight at transition to the approach phase to compute approach speeds (VLS, VAPP, F, S, Green Dot). On the PERF APPR page, the selected LDG CONF determines the applicable VLS and VAPP, the latter being updated by the WIND correction that the flight crew enters on the same page. The FMGEC uses the performance model and gross weight to compute go-around speeds (F, S, Green Dot).

```

OPTIMUM TARGET SPEED FOR CLIMB, CRUISE AND DESCENT (ECON SPD/MACH)

The FMGES computes the optimum target speed (ECON SPD/MACH) as a function of:
- The Cost Index (CI)
- The Cruise Flight Level (CRZ FL)
- The Gross Weight (GW)
- The wind and temperature models
- The performance factor.

The computer processes the ECON SPDs for the climb and descent phases before the initiation of the flight phase, and freezes the values once the flight phase becomes active.
When there is no time or speed constraint/limit, ECON SPEED is the optimum speed for the selected cost index. It refers to fuel and time cost and not directly to fuel saving.
The FM calculates ECON CLB speed before the climb phase begins, and this speed cannot be changed during the climb phase itself.

The ECON DES speed is used to compute the optimum descent profile and the associated top of descent (T/D).
The computer continually updates ECON CRUISE MACH (SPD), taking into account current weather conditions and modifications to the flight plan.

Note: *If the cruise FL is below FL 250, ECON CRUISE SPEED is computed.*
If the cruise FL is above FL 250, ECON CRUISE MACH is computed.

The optimum flight level indicates the most economic flight level for a given cost index, weight, weather data.
It requires a 15 min minimum cruise time. It is continuously updated in flight until 15 NM from the top of descent. It is dashed after this point.

The OPT FL is a compromise between fuel and time saving. As a result, the flight crew may observe jumps in OPT FL due to slight GW, ISA or wind changes.
The computation of the OPT FL considers the wind entries made at the different altitudes (normally at the different CRZ FL).
When flying the subsequent CRZ FL, the OPT FL proposed by the PROG page may be affected by the wind entries made at the previous CRZ FL; these winds are propagated automatically and may be significantly different from the actual winds.

Note: *For simplification purposes, the FCOM/QRH gives the OPT FL at a given Mach number. It does not consider the cost index, therefore the FMGES and the FCOM/QRH values are different.*

The FM updates it continuously during the cruise phase, and displays it on the PROG page.

The PROG page displays dashes for this quantity:
- At least 15 NM before top of descent
- When the system detects an engine-out condition
- When DES phase is activated.

OPTIMUM DESCENT PATH

The vertical flight path is computed to minimize fuel consumption while satisfying the various altitude constraints of the F-PLN and the descent speed profile in order to reach VAPP at 1 000 ft.

The computer calculates the descent profile before the descent phase is initiated, taking into account:
- All the lateral and vertical flight plan data
- The descent and approach winds, as inserted into the DESCENT WIND page and PERF APPR page, and the required maximum cabin rate of descent.

During descent, the descent profile is updated only if the flight plan is modified or if data for the APPR phase (WIND, VAPP, or LDG CONF) are changed.

OPTIMIZATION

Ident.: DSC-22_20-40-10-00012241.0007001 / 18 FEB 15
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The FMGEC minimizes cost by optimizing the following items:
- Takeoff, approach, and go-around speeds (F, S, Green Dot, VAPP)
- Target speed for CLB, CRZ and DES phases (ECON SPD/MACH)
- Flight Level (for flight crew's information)
- Descent profile from CRZ FL down to the destination airport.

These items depend on the data the flight crew inserts during lateral and vertical flight planning and revision procedures.
Most are displayed on the PERF pages associated with the appropriate flight phases.

WIND PROFILE

To obtain the best predictions, the flight crew must enter the wind for the various flight phases and specifically for waypoints in cruise.

- **ON GROUND:**
  During flight planning initialization, enter the winds for the climb and cruise phases using the HISTORY WIND and WIND pages. Enter manually or with AOC, different wind values in the climb and cruise phases. The system will compute a wind for all waypoints of the F-PLN using linear interpolation between manual/AOC entries.
  The wind profile will be displayed on the F-PLN B page, and is called forecast wind profile.
  Flight crew or AOC entries are displayed in large font, and system-computed winds in small font.

- **IN FLIGHT:**
  The system updates the predictions and the current ECON speed, using the measured wind at the present position. It combines actual wind and forecast winds to compute the wind ahead of the aircraft.
  During cruise, the flight crew will enter the descent winds and the approach wind. The system will update the final predictions, compute the optimum descent profile and compute the optimum speed in descent and approach.

The forecast wind profile will be used to compute fuel and time predictions, as well as ECON speed/Mach targets.

OPTIMUM TAKEOFF, APPROACH AND GO-AROUND SPEEDS

The FMGEC computes takeoff speeds (F, S, Green Dot) during the preflight and takeoff phases, using the performance model in the database and the takeoff weight.
The flight crew has to insert V1, VR, and V2 in the PERF TO page manually.
The FMGEC uses the performance model and either the predicted landing weight or the current gross weight at transition to the approach phase to compute approach speeds (VLS, VAPP, F, S, Green Dot). On the PERF APPR page, the selected LDG CONF determines the applicable VLS and VAPP, the latter being updated by the WIND correction that the flight crew enters on the same page. The FMGEC uses the performance model and gross weight to compute go-around speeds (F, S, Green Dot).

OPTIMUM TARGET SPEED FOR CLIMB, CRUISE AND DESCENT (ECON SPD/MACH)

The FMGES computes the optimum target speed (ECON SPD/MACH) as a function of:
- The Cost Index (CI)
- The Cruise Flight Level (CRZ FL)
- The Gross Weight (GW)
- The wind and temperature models
- The performance factor.

The computer processes the ECON SPDs for the climb and descent phases before the initiation of the flight phase, and freezes the values once the flight phase becomes active.
When there is no time or speed constraint/limit, ECON SPEED is the optimum speed for the selected cost index. It refers to fuel and time cost and not directly to fuel saving.
The FM calculates ECON CLB speed before the climb phase begins, and this speed cannot be changed during the climb phase itself.
The ECON DES speed is used to compute the optimum descent profile and the associated top of descent (T/D).
The computer continually updates ECON CRUISE MACH (SPD), taking into account current weather conditions and modifications to the flight plan.

Note: *If the cruise FL is below FL 250, ECON CRUISE SPEED is computed.*
If the cruise FL is above FL 250, ECON CRUISE MACH is computed.

CLIMB PHASE NOT ACTIVE

CLIMB PHASE ACTIVE (speed manually selected 270)

The active mode field changes from MANAGED to SELECTED, and the FM will use the entered speed for climb predictions computation. The flight crew can revert to managed mode by pressing the 3L key.

PRESET TARGET SPEED/MACH FOR DES PHASE

The flight crew can change the speed and/or Mach displayed in the MANAGED field by inserting a speed and/or Mach in the MANAGED field.
Although the entered speed is selected by the flight crew, the FMGES uses it to compute the descent flight path and the top of descent. It is therefore, part of the managed descent profile.

PROG PAGE (CRZ PHASE)

The optimum flight level (OPT FL) indicates the most economic flight level for a given cost index, weight, weather data.
It requires a 5 min minimum cruise time, at a minimum cruise flight level of FL 100. It is continuously updated in flight until the aircraft is predicted to reach the top of descent within 5 min.

The OPT FL is a compromise between fuel and time saving. As a result, the flight crew may observe jumps in OPT FL due to slight GW, ISA or wind changes.
The computation of the OPT FL considers the wind entries made by the flight crew, as well as the winds propagated by the FMS from previously entered winds.

Note: *For simplification purposes, the FCOM/QRH gives the OPT FL at a given Mach number. It does not consider the cost index, therefore the FMGES and the FCOM/QRH values are different.*

The FM updates it continuously during the cruise phase, and displays it on the PROG page.

The PROG page displays dashes for this quantity:
- When the system detects an engine-out condition
- When DES phase is activated.

OPTIMUM DESCENT PATH

The vertical flight path is computed to minimize fuel consumption while satisfying the various altitude constraints of the F-PLN and the descent speed profile in order to reach VAPP at 1 000 ft.

The computer calculates the descent profile before the descent phase is initiated, taking into account:
- All the lateral and vertical flight plan data
- The descent and approach winds, as inserted into the DESCENT WIND page and PERF APPR page, and the required maximum cabin rate of descent.

During descent, the descent profile is updated only if the flight plan is modified or if data for the APPR phase (WIND, VAPP, or LDG CONF) are changed.

Intentionally left blank

COST INDEX (CI)

Ident.: DSC-22_20-40-20-00012222.0001001 / 18 AUG 10
Applicable to: ALL

The cost index is a fundamental input for the ECON SPEED or ECON MACH computation. ECON SPEED and ECON MACH reduce the total flight cost in terms of flight time and fuel consumption (and not only in terms of fuel saving).
CI is the ratio of flight time cost (CT) to fuel cost (CF).
CI = CT/CF (kg/min or 100 lb/h).
CI = 0 corresponds to minimum fuel consumption (MAX Range).
CI = 999 corresponds to minimum time.
CI = Long Range Cruise (*Refer to PRO-NOR-SRP-01-50 Preparation for Descent and Approach - Cost Index for Long-Range Cruise*).

It is recommended to modify the CI in flight:
- In case a fuel problem is encountered, CI = 0 may be selected. The ECON SPD profile is then computed to ensure minimum fuel consumption.
- In case the aircraft is behind its schedule, CI = 999 may be selected. The ECON SPD profile is then computed to ensure minimum time.

OPTIMUM STEP POINT

Only one optimum step point may be computed from the current cruise FL to a higher cruise FL. After insertion, the optimum step point is fixed and no longer updated.
The step altitude, time and fuel savings are provided before the insertion of an optimum step climb point on the STEP ALTS page.

Note: *The airline's operations department usually defines the cost index to optimize each company route. The flight crew does not ordinarily modify the cost index during a flight.*

Intentionally left blank

GENERAL

Ident.: DSC-22_20-40-30-00012136.0001001 / 18 AUG 10
Applicable to: ALL

The FMGEC computes predictions for the primary flight plan and the secondary flight plan and displays them on the Multipurpose Control and Display Units (MCDUs) and on the Navigation Display (ND) of the Electronic Flight Instrument System (EFIS).
The computations use the current state of the aircraft (GW, CG, position, altitude, speed, engaged mode of the autopilot or flight director, time, wind, temperature) for the active flight plan.

PREDICTIONS FOR THE PRIMARY FLIGHT PLAN

Ident.: DSC-22_20-40-30-00012137.0001001 / 18 AUG 10
Applicable to: ALL

The predictions displayed on the MCDU assume that the FMGES will guide the aircraft along the preplanned lateral and vertical flight plans.
The predictions displayed on the ND assume that the aircraft will continue to operate in the modes (selected or managed) that are currently active.
As long as the aircraft is flying the flight plan under managed guidance, the predictions on the MCDU will match those on the ND.

If the flight crew does not fly the flight plan, the MCDU predictions assume that:
- The flight crew will fly back towards the flight-planned route.
- The flight crew will immediately resume flying the FMGEC managed modes.

If the flight crew does not fly the managed speed profile, the MCDU predictions assume that they will maintain the selected speed until they reach:
- In the climb or descent phase, the next speed limit or speed constraint if any, or next phase
- In cruise, the top of descent.

Then, the predictions assume that the flight crew will revert to managed speed.

COMPUTATION OF PREDICTIONS

Ident.: DSC-22_20-40-30-00012138.0001001 / 18 AUG 10
Applicable to: ALL

The system calculates various predictions for the active flight plan and updates them continually during flight as functions of:
- Revisions to the lateral and vertical flight plans
- The cost index
- Current winds and temperature
- Present position versus lateral and vertical flight plans

- Current guidance modes
- Speed control (managed/selected).

The MCDU and the ND show these predictions, each of which is based on specific assumptions.

Note: *During computation, prediction fields on the MCDU pages show dashes.*

PREDICTIONS DISPLAYED ON THE NAVIGATION DISPLAY

Ident.: DSC-22_20-40-30-00012139.0001001 / 01 OCT 12
Applicable to: ALL

These predictions consist of symbols positioned along the lateral flight plan (NAV mode engaged) or the track line (NAV mode not engaged). These symbols (named as pseudo waypoints) and their meanings are:

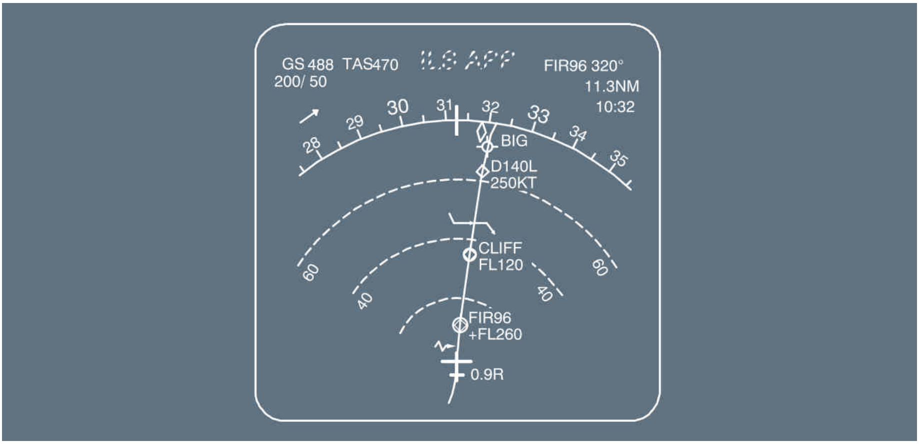
Pseudo waypoint	Definition
	Level symbol, at the position (top of climb or level-off) where the aircraft will reach: - The FCU selected altitude (blue arrow) - The constrained altitude, if it is more restrictive than the FCU altitude and if appropriate modes are engaged (magenta arrow).
	Top of descent or continue descent symbol: - Top of descent (always white) - Continue descent symbol (white if DES is not armed, blue if it is).
	Start of CLIMB symbol: - White if CLB is not armed - Blue if CLB is armed.
	Intercept point symbol: The point where the aircraft is predicted to intercept the descent path, if there is any vertical deviation when the aircraft is in DES mode (white if DES is not engaged, blue if it is).
•	Speed change symbol: The point at which the aircraft will initiate an automatic ACCEL or DECEL from current speed to a new computed speed if it encounters a SPD LIM, SPD CSTR, or HOLDING SPD (magenta).
	Decelerate point symbol: - Indicates the point at which the aircraft is predicted to decelerate for approach (and thus switch to the approach phase) - Magenta, if in managed speed and NAV or approach mode is engaged - White, if in selected speed or HDG/TRK mode - Automatic deceleration only occur when displayed in magenta.

Continued on the following page

Continued from the previous page

Pseudo waypoint	Definition
○	ALT CSTR symbol set around the constrained waypoint: - Magenta, when the ALT CSTR is predicted to be satisfied - Amber, when the ALT CSTR is predicted to be missed - White, when the ALT CSTR is not taken into account by the guidance, and the NAV mode is engaged.
◠	Energy circle symbol (green arc) centered on the aircraft position and oriented to the current track line. Represents the Required Distance to Land. Only displayed if the lateral guidance mode is heading or track, and the current FMS flight phase is in cruise, descent or approach, and the aircraft is within 180 NM of the destination.
Crosstrack error XX.XR or XX.XL (X is a number)	The crosstrack error displays the lateral deviation between the aircraft position and the track of the F-PLN active leg. The value is limited to 99.9 NM left or right.
INTCPT	Intercept waypoint is displayed on the ND at the point at which the present track intercepts the F-PLN.

The predicted time of arrival at the TO WPT is located in the upper right-hand corner of the ND. It assumes direct distance from the aircraft position to the TO WPT and assumes current ground speed will be constant.



As a general rule, the ND indicates what the aircraft will fly, with the current active FG modes.

For example:

- The continuous green line on the ND represents the track the aircraft is currently flying:
  - If HDG/TRK is engaged, the track line is green and the flight plan is dashed
  - If NAV mode is engaged, the green line is the flight plan.
- If the speed target is manually selected, the speed-change symbol is no longer displayed because it will not be taken into account.
- When the aircraft is not following the vertical flight plan (OP CLB,OP DES, V/S) but the NAV mode is engaged, the system disregards any altitude constraints and puts white circles around the waypoints that have these constraints and positions level symbols accordingly.
- Pseudo waypoints are adjusted each time predictions are updated.

PREDICTIONS DISPLAYED ON THE MCDU

Ident.: DSC-22_20-40-30-00012140.0001001 / 14 MAY 12
Applicable to: ALL

The predictions displayed on the MCDU assume that AP (or FD order) is controlling the aircraft and flying it along the preplanned lateral and vertical flight plan.

Therefore:

- If the aircraft is guided along the flight plan (managed guidance), the MCDU predictions correspond exactly to what the aircraft is doing.
- If the aircraft is not guided along the flight plan (selected guidance), the MCDU predictions assume that it will return immediately to the flight plan, intercepting at a predetermined angle, and will then proceed under managed guidance.
- If the aircraft does not fly the managed speed profile (ECON, SPD CSTR...), the MCDU predictions assume that it will remain at the present selected speed/Mach until it reaches the next SPD CSTR or SPD LIM or enters the next flight phase.
- The TO waypoint information in the right upper corner are updated as if the aircraft would still fly toward it.

CONSTRAINT SYMBOLS (STAR)

Ident.: DSC-22_20-40-30-00012143.0001001 / 14 MAY 12
Applicable to: ALL

When a time speed or an altitude constraint is part of the vertical flight plan, it appears on the F-PLN A page only at the time of insertion, or when predictions are not yet available. Once available, the time speed and altitude predictions are displayed for all F-PLN waypoints: When a speed or an altitude constraint is at a waypoint, a star symbol appears adjacent to the speed or altitude prediction. If the star is magenta, the constraint is predicted to be matched. If the star is amber, the constraint is predicted to be missed.

Note: *If an altitude constraint is predicted as missed, the system tells you what will be the error at the specific waypoint.*

VERTICAL DEVIATION

Ident.: DSC-22_20-40-30-00012144.0001001 / 18 AUG 10

Applicable to: ALL

During descent, the system tells you how far you are from the computed descent profile (PFD and MCDU) and predicts where you may rejoin it.

VDEV on the PFD and PROG page, predictions on the MCDU F-PLN page, symbols on the ND display, allows you to assess your vertical position versus the computed flight profile.

The energy circle displayed on ND, representing the required distance to land from present position and current speed down to destination at VAPP, may also be used to tell you if you need to modify the flight path you intend to fly.

OPERATION RULES CONCERNING PREDICTIONS

Ident.: DSC-22_20-40-30-00012145.0001001 / 18 AUG 10
Applicable to: ALL

The flight crew must keep the flight plan data properly updated during the flight in order to get accurate and meaningful predictions.
The flight crew should rely on the ND for short-term predictions. It indicates what the aircraft will do under the currently engaged modes (selected or managed).
The flight crew should rely on the MCDU for long-term predictions when managed guidance is active or about to be reengaged.

OTHER COMPUTATIONS

Ident.: DSC-22_20-40-30-A-00012146.0001001 / 18 AUG 10
Applicable to: ALL

ENGINE-OUT CASE

The FMGES computes an engine-out target speed for each flight phase.
It computes an engine-out maximum altitude (EO MAX ALT) at long-range cruise speed, and displays it on the PROG page. The new speed target becomes Green Dot in climb phase or EO CRZ SPD in level flight.
The system computes the flight plan predictions down to the primary destination assuming that the cruise phase is at the lower of CRZ FL or EO MAX ALT.
For the engine-out obstacle strategy, the system computes a drift down descent at Green Dot and down to a level off altitude.

Ident.: DSC-22_20-40-30-A-00012147.0001001 / 18 AUG 10
Applicable to: ALL

FUEL PLANNING

After the F-PLN, CRZ FL, CI, ZFW, and ZFWCG insertion, the FMGEC may compute on flight crew request the minimum fuel to meet the requirements of the flight taking into account a predetermined fuel policy (Navigation Database).
Fuel predictions are automatically performed after the F-PLN, CRZ FL, and ZFW insertion. The FMGEC has to know the FOB either inserted by the flight crew (BLOCK FUEL) or computed by the system.

Ident.: DSC-22_20-40-30-A-00012148.0001001 / 18 AUG 10
Applicable to: ALL

EQUI-TIME POINT (ETP)

The ETP is a pseudo waypoint along the lateral flight plan at which the time to reach two reference waypoints is the same, taking distance and winds into account.

Ident.: DSC-22_20-40-30-A-00012149.0001001 / 18 AUG 10
Applicable to: ALL

TIME MARKER

This pseudo waypoint may be created for display on MCDU/ND.

Ident.: DSC-22_20-40-30-A-00012150.0001001 / 03 MAY 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

RECOMMENDED MAXIMUM ALTITUDE (REC MAX)

The recommended maximum altitude is the lowest of the maximum altitude that:
- The aircraft can reach with a 0.3 g buffet margin
- The aircraft can fly in level flight at MAX CRZ rating
- The aircraft can maintain a V/S of 300 ft/min at MAX CLB thrust
- The aircraft can fly at a speed above the Green Dot and below the VMO/MMO
- The aircraft is certified at.

The REC MAX altitude is displayed on the PROG page.
Anti-ice is not taken into account for this computation. If icing conditions are expected, use the performance application of the EFB.
A maximum altitude using a 0.2 g buffet margin is also computed. It is not displayed, but the system uses it to limit CRZ ALT entry.

Ident.: DSC-22_20-40-30-A-00012150.0003001 / 03 MAY 23
Applicable to: LV-GKO, LV-GKP

RECOMMENDED MAXIMUM ALTITUDE (REC MAX)

The recommended maximum altitude is the lowest of the maximum altitude that:
- The aircraft can reach with a 0.3 g buffet margin
- The aircraft can fly in level flight at MAX CRZ rating
- The aircraft can maintain a V/S of 300 ft/min at MAX CLB thrust
- The aircraft can fly at a speed above the Green Dot and below the VMO/MMO
- The aircraft is certified at.

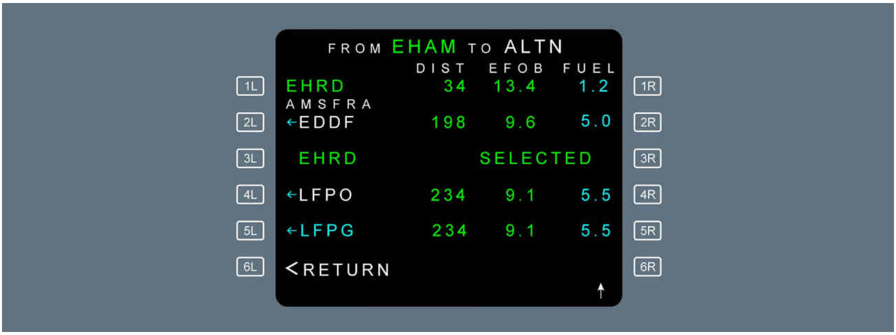
The REC MAX altitude is displayed on the PROG page.
Anti-ice is not taken into account for this computation. If icing conditions are expected, use the performance application of the EFB.
A maximum altitude using a 0.2 g buffet margin is also computed. It is not displayed, but the system uses it to limit CRZ ALT entry.

Note: *A REC MAX value exceeding FL 411 should be disregarded.*

Ident.: DSC-22_20-40-30-A-00012151.0004001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

PREDICTIONS FOR ALTERNATES

Predictions for alternates are displayed on the ALTERNATE page.



```
     FROM EHAM TO ALTN
              DIST  EFOB  FUEL
EHRD            34  13.4   1.2
AMSFRA
←EDDF          198   9.6   5.0
 EHRD            SELECTED

                             ↑
```

They are based on:
- A default cruise FL equal to 220 if the airway distance is less than 200 NM. Otherwise, it is FL 310
- Simplified wind/temperature models based on flight crew entries:
  - ALTN CRZ wind as entered in the primary DESCENT WIND page
  - Wind temperature at primary destination (APPR page).
    A zero wind and/or zero ISA deviation is assumed by default if there is no flight crew entry.
- Initial aircraft weight is equal to landing weight at primary destination
- A track equal to mean track between active primary and alternative destination
- A constant delta ISA and a constant cruise wind
- Cost index = 0 (minimum fuel).

Note: 1. *No step can be inserted in alternate flight plan.*
2. *No predictions are displayed for the selected alternate on flight plan pages, but the flight crew can read ALTN trip fuel and time on the INIT FUEL PRED page before engine start, and estimated time and estimated fuel on board at alternate on the FUEL PRED page after engine start.*

Ident.: DSC-22_20-40-30-A-00012151.0001001 / 18 AUG 10
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

PREDICTIONS FOR ALTERNATES

Predictions for alternates are displayed on the ALTERNATES page.

- Cost index = 0 (minimum fuel).

Note: *1. No step can be inserted in alternate flight plan.*
2. No predictions are displayed for the selected alternate on flight plan pages, but the flight crew can read ALTN trip fuel and time on the INIT B page before engine start, and estimated time and estimated fuel on board at alternate on the FUEL PRED page after engine start.

Ident.: DSC-22_20-40-30-A-00012152.0001001 / 18 AUG 10
Applicable to: ALL

PREDICTIONS FOR SECONDARY FLIGHT PLAN

Predictions are provided on the SEC F-PLN, SEC INIT and SEC PERF pages as for the active primary flight plan.
However, the predictions are provided for the SEC F-PLN on the condition that primary and secondary flight plans have their active leg common (same TO WPT).

Ident.: DSC-22_20-40-30-A-00012153.0004001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

PREDICTIONS FOR FUEL

Up to 8 fuel policy records may be specified in the navigation database.
If a specific data is not provided in the database fuel policy, the value is the default value given here after:

PARAMETERS		DEFAULT VALUES
RTE RSV	(Percentage of route reserve)	5 %
RSV MIN	(Minimum value of route reserve)	0 kg
RSV MAX	(Maximum value of route reserve)	25 600 kg (56 500 lb)
RSV FLT	(Reserve remains computed in flight)	Yes
RSV ALTN	(Reserve is computed with alternate trip fuel)	No
FINAL TIME	(Time for final holding pattern)	30 min
FINAL FIX	(Fuel burnt in the final holding pattern)	0 kg
FINAL ALT	(Altitude for final holding pattern)	1 500 ft AGL
TAXI	(Fuel for taxi)	600 kg (1 300 lb)
FINAL DEST	(Final holding pattern is flown at ALTN)	ALTN

Furthermore, RTE RSV, FINAL TIME and TAXI may be modified on the MCDU through the INIT FUEL PRED or FUEL PRED pages.

Ident.: DSC-22_20-40-30-A-00012153.0001001 / 19 APR 17
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

PREDICTIONS FOR FUEL

Up to 8 fuel policy records may be specified in the navigation database.
If a specific data is not provided in the database fuel policy, the value is the default value given here after:

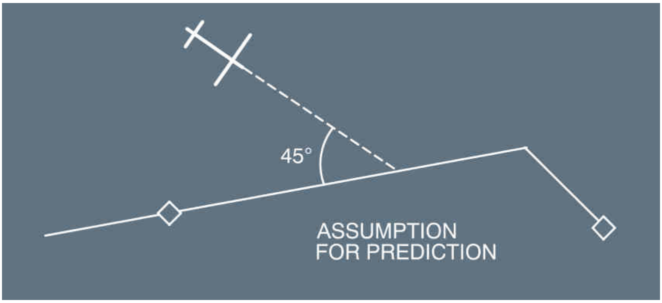
PARAMETERS		DEFAULT VALUES
RTE RSV	(Percentage of route reserve)	5 %
RSV MIN	(Minimum value of route reserve)	0 kg
RSV MAX	(Maximum value of route reserve)	25 600 kg (56 500 lb)
RSV FLT	(Reserve remains computed in flight)	yes
RSV ALTN	(Reserve is computed with alternate trip fuel)	no
FINAL TIME	(Time for final holding pattern)	30 min
FINAL FIX	(Fuel burnt in the final holding pattern)	0 kg
FINAL ALT	(Altitude for final holding pattern)	1 500 ft AGL
TAXI	(Fuel for taxi)	600 kg (1 300 lb)
FINAL DEST	(Final holding pattern is flown at ALTN)	ALTN

Furthermore, RTE RSV, FINAL TIME and TAXI may be modified on the MCDU through the INIT B or FUEL PRED pages.

RETURN-TO-TRAJECTORY ASSUMPTIONS

Ident.: DSC-22_20-40-30-00012154.0001001 / 19 DEC 12
Applicable to: ALL

If the aircraft is not on the lateral flight plan, the FMGEC assumes (for prediction) that it will return immediately to the active lateral leg with a 45 ° convergence angle or that it will fly directly to the "TO" waypoint whenever the required convergence angle is greater than 45 °.



If the flight crew flies outside the planned flight plan, predictions are still available but they assume an immediate return to flight plan.

INTRODUCTION TO PERF AND IDLE FACTORS

Ident.: DSC-22_20-40-30-00012155.0001001 / 21 MAR 17
Applicable to: ALL

The FMGES contains a performance database to compute the predictions and the performance data. This performance database has a model of several aircraft configurations (aircraft type/engine model) to tune the performance and the FMGES predictions. For some aircraft configurations, the model can differ from the real aircraft performance. In these cases, the FMGES has to correct the computation of the performance and the predictions. This is the aim of PERF and IDLE factors. With time, the real aircraft drag and engine performance can deviate from the nominal model. The airline Flight Operations should periodically revise the value of these factors to adapt FMGES predictions to actual aircraft performance.

PERF FACTOR

Applicable to: ALL

Ident.: DSC-22_20-40-30-B-00012157.0001001 / 28 JAN 13

GENERAL

The FMGES uses the PERF factor to correct the predicted fuel flow that is used for the computation of the fuel predictions.

The PERF factor modifies the predicted fuel flow, according to the following formula:

$$\text{FFpred} = \text{FFmodel} \times \left(1 + \frac{\text{PERF FACTOR}}{100}\right)$$

FFpred is the FF used for prediction.
FFmodel is the FF from the aero-engine model.

This correction is applied throughout the entire flight, and modifies the performance predictions and the ECON speed or Mach.
For example: Entering a PERF factor of +1.5 means that Flight Operations have evaluated the aircraft fuel deviation as 1.5 %, compared to the basic performance model (0.0).

IDLE FACTOR

Ident.: DSC-22_20-40-30-C-00014708.0001001 / 21 MAR 17
Applicable to: ALL

GENERAL

The FMGES uses the IDLE factor to adjust the computation of the vertical profile during the descent phase (IDLE segment).

The FMGES computes the vertical profile and the predictions from the Top of Descent (T/D) to the first altitude constraint with the following assumptions:
- The aircraft has a given thrust
- The aircraft has a given speed (within the speed target range).

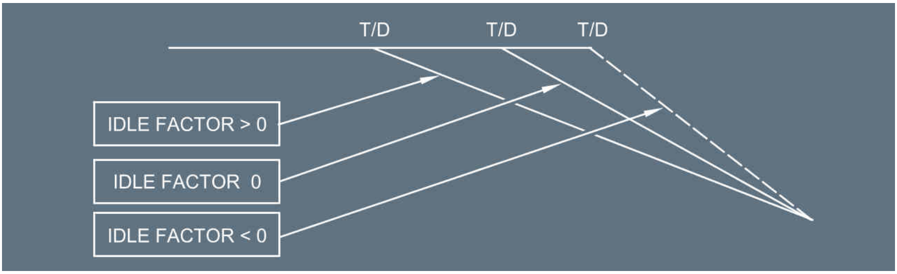
The IDLE Factor adjusts the value of the given thrust by an addition of a delta (DELTA) thrust to IDLE thrust. With this additional thrust, the IDLE Factor gives flexibility to maintain the aircraft on the computed vertical profile in case of external perturbations, such as windy conditions (previously entered by the flight crew in WIND pages).
Depending on the IDLE factor value, the FMGES modifies the position of the T/D and computes a vertical profile in function of the given thrust (IDLE + DELTA).

Therefore, the IDLE factor has a direct impact on:
- The computation of vertical profile
- The capability of the aircraft to maintain the vertical profile.

Ident.: DSC-22_20-40-30-C-00014709.0001001 / 21 MAR 17
Applicable to: ALL

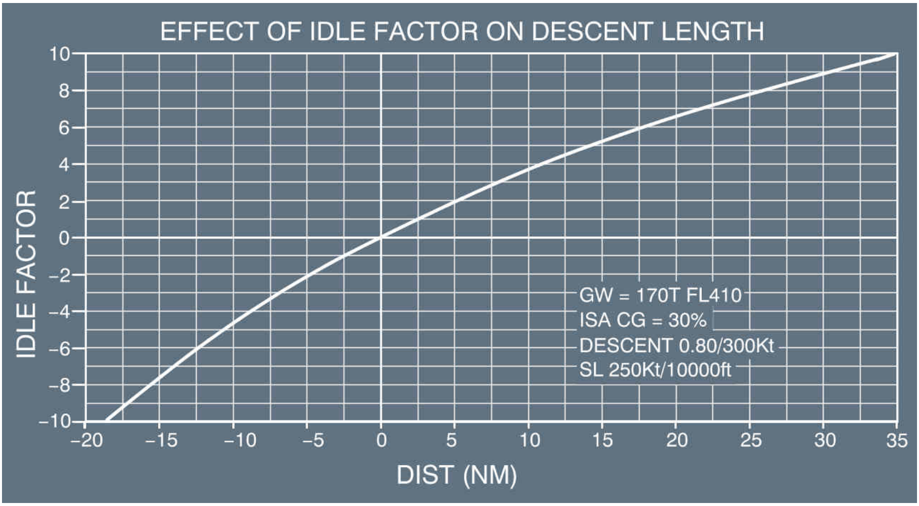
IMPACT ON VERTICAL PROFILE

- If the IDLE factor is positive, the vertical profile is less steep than with IDLE factor 0. The descent phase starts earlier.
- If the IDLE factor is negative, the descent path is steeper than with IDLE factor 0. The descent phase start later.



Ident.: DSC-22_20-40-30-C-00014714.0004001 / 28 JAN 13
Applicable to: LV-KHT, LV-KHU

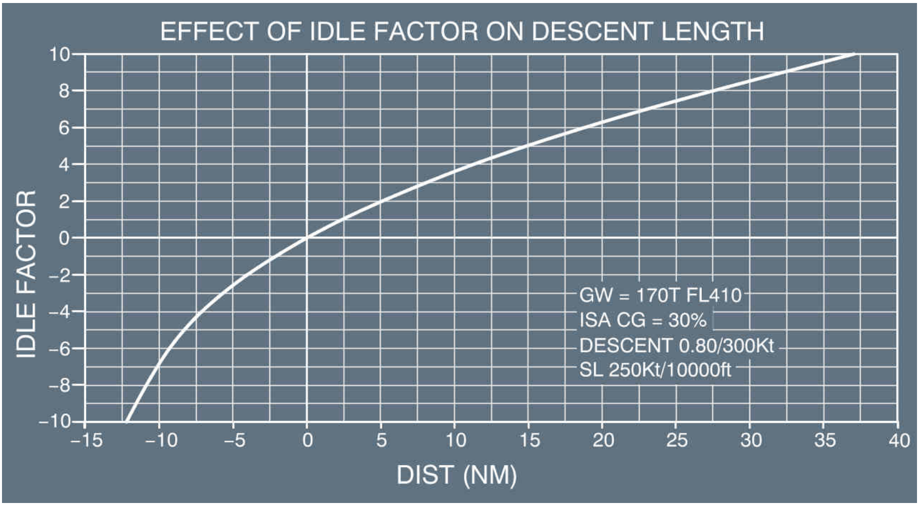
The following figure shows the IDLE factor effect on the descent length.



Example: IDLE factor of +4 increases the computed descent by 11 NM.

Ident.: DSC-22_20-40-30-C-00014714.0002001 / 28 JAN 13
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The following figure shows the IDLE factor effect on the descent length.

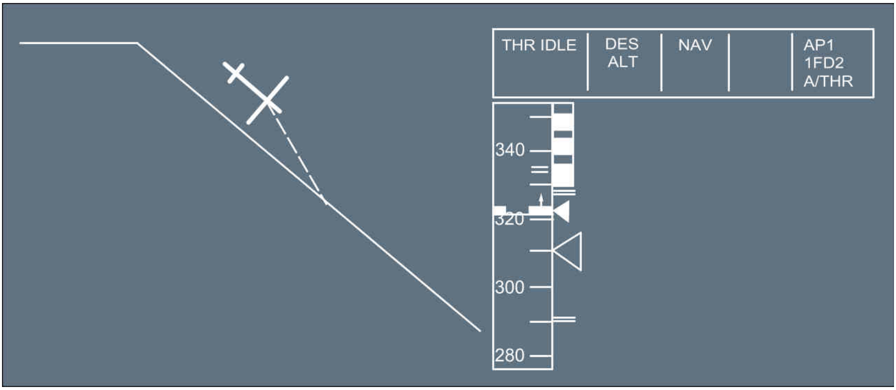


Example: IDLE factor of +4 increases the computed descent by 12 NM.

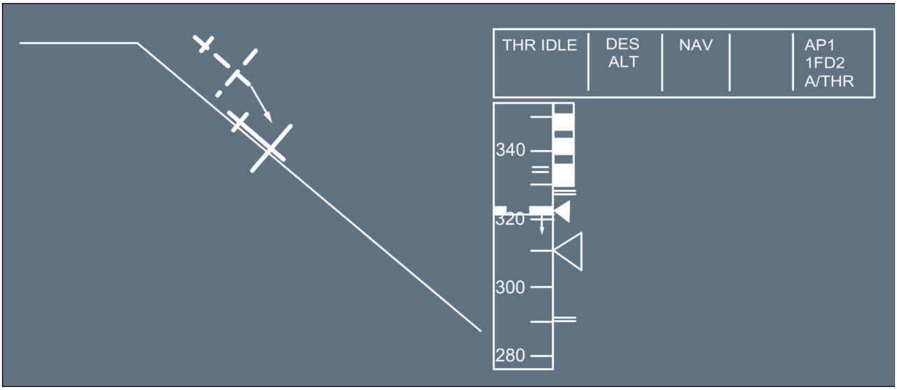
Ident.: DSC-22_20-40-30-C-00014710.0001001 / 30 JAN 13
Applicable to: ALL

IMPACT ON GUIDANCE

In DES mode, the FMGES maintains the aircraft on the vertical profile and keeps the IAS within the speed target range.
If the aircraft deviates above the profile, the IAS will increase to return to the vertical profile.



When the aircraft returns to the descent profile, the IAS will decrease to the target speed.



PROCEDURE TO MODIFY THE PERF AND IDLE FACTORS

Ident.: DSC-22_20-40-30-00014711.0001001 / 28 JAN 13
Applicable to: ALL

PROCEDURE TO MODIFY THE PERF AND IDLE FACTORS (ON GROUND ONLY)

- PRESS the MCDU DATA key and then the A/C STATUS prompt in order to access the A/C STATUS page.
- ENTER the change code in the CHG CODE field.
  The default value for this code is “ARM” but it is possible to modify it on airline request.

  The applicable code is then coded:
  - In the Airline Modifiable Information (AMI) file for aircraft with FMS2 Honeywell or Thales
  - In the Navigation Database policy file for aircraft with FMS1 Honeywell Legacy.

  When a valid change code is entered, the IDLE and PERF factors are displayed in blue.
- ENTER the new IDLE and PERF factors in the scratchpad separated by a "/".
  For example: "-2/+1"
- PRESS the corresponding key to insert the new IDLE and PERF factors.

The new IDLE and PERF factors are displayed in large blue font.

Note: *Only authorized personnel should take the responsibility to update the IDLE and PERF factor values.*

Intentionally left blank

TAKEOFF SURVEILLANCE FUNCTION

Ident.: DSC-22_20-45-10-10-00022057.0001001 / 05 JUN 18
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The Takeoff Surveillance (TOS) function checks the takeoff data that the flight crew enters and selects on the FMS pages.
The takeoff surveillance function applies to the FMS pages that are associated with the active flight plan only.

The checks aim to ensure that the takeoff data is:
- Consistent
- Compatible with the aircraft performance data that is required for takeoff.

The FMS performs the following takeoff checks:
- The ZFW check
- The takeoff speeds check.

Ident.: DSC-22_20-45-10-10-00022058.0001001 / 03 NOV 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

ZFW CHECK

The FMS checks that the ZFW value that the flight crew enters on the FUEL PRED page is within the acceptable range.
If the entered ZFW is not within the acceptable range, the MCDU scratchpad displays the ENTRY OUT OF RANGE message.

Ident.: DSC-22_20-45-10-10-00022059.0002001 / 03 NOV 22
Applicable to: LV-KHT, LV-KHU

TAKEOFF SPEEDS CHECK

For the takeoff speeds (V1, VR, and V2) that the flight crew enters on the PERF TAKEOFF page of the MCDU:
- The FMS compares V1, VR, and V2.

  If the entered V1, VR, and V2 do not satisfy the condition V1≤VR≤V2:
  - The MCDU scratchpad displays the V1/VR/V2 DISAGREE message.
- The FMS checks that V1, VR, and V2 satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G). If the entered V1, VR, and V2 do not satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G):
  - The MCDU scratchpad displays the TO SPEED TOO LOW message.

Ident.: DSC-22_20-45-10-10-00022059.0011001 / 03 NOV 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

TAKEOFF SPEEDS CHECK

For the takeoff speeds (V1, VR, and V2) that the flight crew enters on the PERF TAKEOFF page of the MCDU:

- The FMS checks that the V1, VR, and V2 entry fields contain values.

  If the flight crew does not enter one or more of the takeoff speed values, the ECAM triggers the T.O SPEEDS NOT INSERTED alert, when:
  - The flight crew presses the T.O CONFIG pb, or
  - The engines are set to takeoff power.

- The FMS compares V1, VR, and V2.

  If the entered V1, VR, and V2 do not satisfy the condition V1≤VR≤V2:
  - The MCDU scratchpad displays the V1/VR/V2 DISAGREE message.
  - The ECAM triggers the T.O V1/VR/V2 DISAGREE alert, when:
    - ■ The flight crew presses the T.O CONFIG pb, or
    - ■ The engines are set to takeoff power.

- The FMS checks that V1, VR, and V2 satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G). If the entered V1, VR, and V2 do not satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G):

  - The MCDU scratchpad displays the T.O SPEEDS TOO LOW message.
  - The ECAM triggers the T.O SPEEDS TOO LOW alert, when:
    - ■ The flight crew presses the T.O CONFIG pb, or
    - ■ The engines are set to takeoff power.

ASSOCIATED ALERTS AND MESSAGES

Ident.: DSC-22_20-45-10-30-00022062.0006001 / 05 JUN 18
Applicable to: LV-FVI, LV-KAN, LV-KAO

ASSOCIATED ALERTS

If the takeoff surveillance function of the FMS detects an abnormal situation, one or more of the following ECAM alerts are triggered:

- T.O SPEEDS NOT INSERTED
- T.O SPEEDS TOO LOW
- T.O V1/VR/V2 DISAGREE

Ident.: DSC-22_20-45-10-30-00022063.0002001 / 05 JUN 18

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

ASSOCIATED MESSAGES

On the MCDU, the FMS message area displays the following messages:

- ENTRY OUT OF RANGE
- TO SPEED TOO LOW
- V1/VR/V2 DISAGREE .

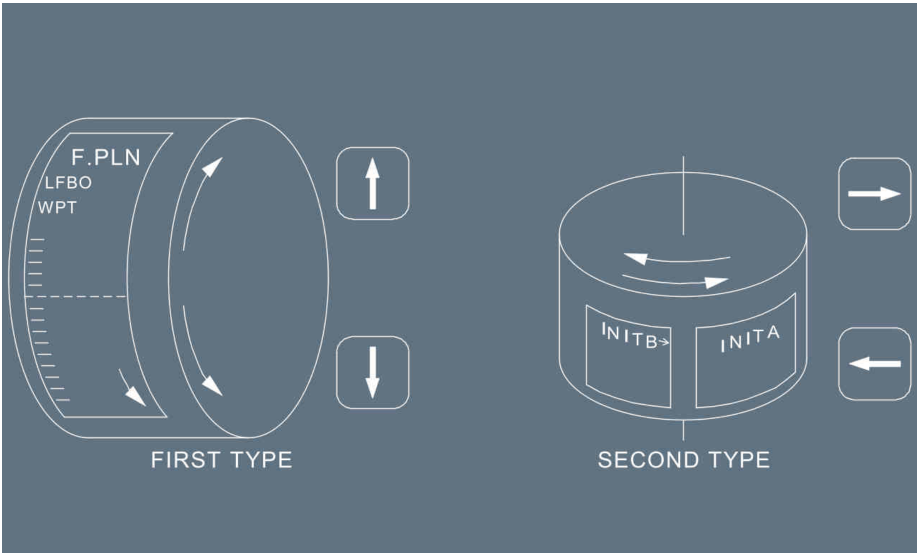
Intentionally left blank

FMS2 Honeywell

GENERAL

Ident.: DSC-22_20-50-10-25-00006608.0001001 / 16 MAR 11
Applicable to: ALL

The FMGES (flight management guidance and envelope system) displays information on various “pages”. When a page cannot display all the information assigned, it cues the pilot to call up additional information.
There are three types of pages, and each type has its particular way of cuing the pilot to call up additional information.



FIRST TYPE

When this page cannot display all the information on the screen simultaneously (more information than the six pairs of lines on the screen can hold), the pilot can scroll the page up or down. When this is the case, the screen displays a ↑ ↓ symbol in its bottom righthand corner (F-PLN pages, secondary F-PLN page, departure/arrival pages,...).

SECOND TYPE

When successive pages hold the information, the pilot presses the [→] [←] keys to call up these pages sequentially.

In this case, the page displays an arrow in the top right hand corner of the screen (INIT pages).

THIRD TYPE

When successive pages hold different types of information, the pilot calls these up by pressing the key adjacent to the prompts >, < or *.

3R
4R
5R
6R

The pilot selects a system by pressing the key adjacent to the name of that system. The screen shows the name of the selected system in green, all others in white.
If the MCDU cannot establish communication with the selected system, it displays “TIME OUT”.

When a system calls for pilot attention, the MCDU displays “REQ” next to the system name, and the “MCDU MENU” annunciator lights up.
When the pilot presses the key next to the name of the system that requires attention, the “MCDU MENU” annunciator light goes out.

SELECT NAV B/UP	Pressing the [1R] key selects the NAV B/UP function and the field displays DESELECT NAV B/UP. If the NAV B/UP is inoperative, the field is blank.
RETURN	This field is displayed when a function is active

If the MCDU attempts to communicate with a system, “SEL” is displayed next to the system name.

INIT A PAGE

Ident.: DSC-22_20-50-10-25-00006643.0008001 / 01 MAR 18
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

The flight crew uses the INIT A page to initialize the flight plan and align the inertial reference system.

- During the entire flight, the flight crew can access this page by pressing the INIT key on the MCDU console.
- The flight crew may also call up this page by:
  - Pressing the [→] or [←] keys on the MCDU console, while INIT FUEL PRED page is selected, or
  - Pressing the key next to “RETURN” or “INSERT” on the route selection page, or
- The flight crew may press the INIT key when in the done phase, to begin the next preflight phase.

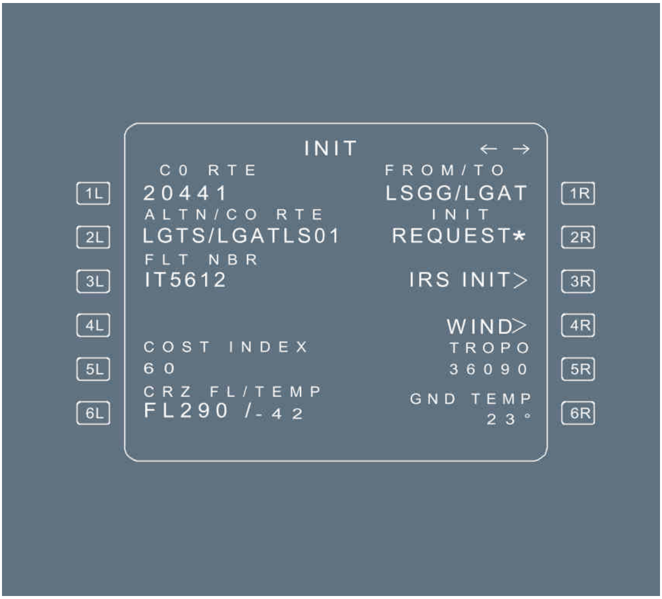
CRZ FL/TEMP FL290 /-42
GND TEMP 23°

[1L] CO RTE	If the flight crew enters a company route number, the screen displays all data associated with that route (10 characters maximum). Inserting the CO RTE into the RTE selection page also enters the CO RTE number in this field.

[2L] ALTN/CO RTE (blue)	This field is dashed until a primary destination is entered in the 1R field. If a preferred alternate is associated with the primary destination, it is displayed in this field with the company route identification. The pilot may enter an alternate and a company route manually. If preferred alternate is not associated with the primary destination, “NONE” is displayed in this field. When the alternate route and the primary destination do not match, the MCDU scratchpad displays “DEST/ALTN MISMATCH”. If the primary destination is changed, this field is modified accordingly. The pilot may modify it during the flight.
[3L] FLT NBR	The flight number automatically appears in this field, if it is stored with the company route. The pilot may modify it, or enter a new number here.
[5L] COST INDEX	This is usually stored in the database, along with the company route. The pilot may modify it, or enter a new value here. The system defaults to the last entered value, if a value is not stored in the database.
[6L] CRZ FL/TEMP (cruise flight level and temperature)	The cruise flight level is usually stored in the database, along with the company route. If not, it has to be entered manually. If no cruise flight level is entered, the system will not provide predictions while the aircraft is on ground. The pilot has to enter the temperature at cruise flight level, in order to refine the predictions. Otherwise, these are computed for ISA conditions. (If no sign is entered, the system uses plus).
[1R] FROM/TO	This field allows the pilot to enter a city pair (ICAO codes for city of origin and destination). This entry automatically deletes any previously-entered company route, and calls up the route selection page. If one airfield of the pair is not in the database, the display changes to the NEW RWY page.



```
                 INIT                 ← →

FL290 /-42                     23°
```

[2R] INIT REQUEST	This prompt is displayed, if the pilot did not enter an active flight plan, or entered a flight number or a company route that is not in the aircraft database. Selecting this prompt sends the ground a request for active flight plan initialization (downlink message). When the asterisk is not displayed, a downlink message cannot be sent. The uplink flight plan is automatically inserted in the active flight plan, prior to engine start, provided an active flight plan does not exist. After engine start, the uplink flight plan is sent to the secondary flight plan, and manually inserted or rejected.
[3R] IRS INIT	The pilot presses this key to access the IRS INIT page.
[4R] WIND	The pilot presses this key to access the climb wind page, unless a temporary flight plan exists. If this is case, the scratchpad displays “TEMPORARY F-PLN EXISTS”.
[5R] TROPO	The default tropopause altitude is 36 090 ft. The pilot can use this field to modify it (60 000 ft maximum).

[6R] GND TEMP	The flight crew can use this field to insert the ground temperature (in Celsius) during the cockpit preparation. The FMS uses this value to compute the ISA deviation profile for the Climb segment. When no flight crew entry exists, or if the flight crew entry is cleared, the GND TEMP value reverts to the default ISA value at the selected Departure Airport altitude.

INIT A PAGE

Ident.: DSC-22_20-50-10-25-00006643.0004001 / 01 MAR 18
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

The pilot uses the INIT A page to initialize the flight plan and align the inertial reference system.

- During the entire flight, the pilot can access this page by pressing the INIT key on the MCDU console.
- The pilot may also call up this page by:
  - Pressing the [→] or [←] keys on the MCDU console, while INIT B page is selected, or
  - Pressing the key next to “RETURN” or “INSERT” on the route selection page, or
- The pilot may press the INIT key when in the done phase, to begin the next preflight phase.

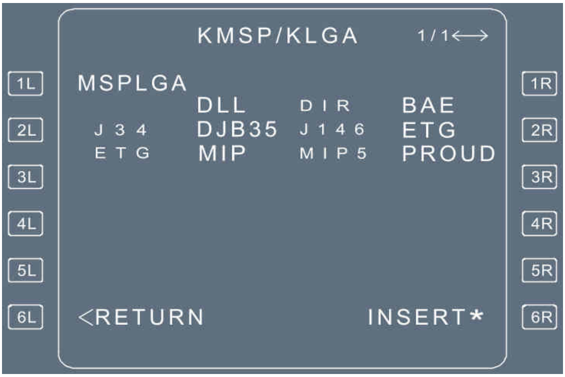
[2R] INIT REQUEST	This prompt is displayed, if the pilot did not enter an active flight plan, or entered a flight number or a company route that is not in the aircraft database. Selecting this prompt sends the ground a request for active flight plan initialization (downlink message). When the asterisk is not displayed, a downlink message cannot be sent. The uplink flight plan is automatically inserted in the active flight plan, prior to engine start, provided an active flight plan does not exist. After engine start, the uplink flight plan is sent to the secondary flight plan, and manually inserted or rejected.
[3R] IRS INIT	The pilot presses this key to access the IRS INIT page.
[5R] WIND	The pilot presses this key to access the climb wind page, unless a temporary flight plan exists. If this is case, the scratchpad displays “TEMPORARY F-PLN EXISTS”.
[6R] TROPO	The default tropopause altitude is 36 090 ft. The pilot can use this field to modify it (60 000 ft maximum).

ROUTE SELECTION PAGE

Ident.: DSC-22_20-50-10-25-00006664.0001001 / 17 MAR 11
Applicable to: ALL

This page displays all the company routes stored in the data base that are associated with the inserted city pair. The pilot may call it up manually, or it may be displayed automatically.

- Manually : The pilot presses the FROM/TO or ALTN key on the INIT A page when a city pair is displayed there.
- Automatically : The system displays it when the pilot enters a city pair or defines an alternate on the INIT A page of the active or secondary flight plan, or when the flight crew enters an OTHER ALTN on the alternate page.



```
             KMSP/KLGA        1/1<->
MSPLGA
             DLL       DIR    BAE
  J34        DJB35     J146   ETG
  ETG        MIP       MIP5   PROUD

<RETURN                    INSERT*
```

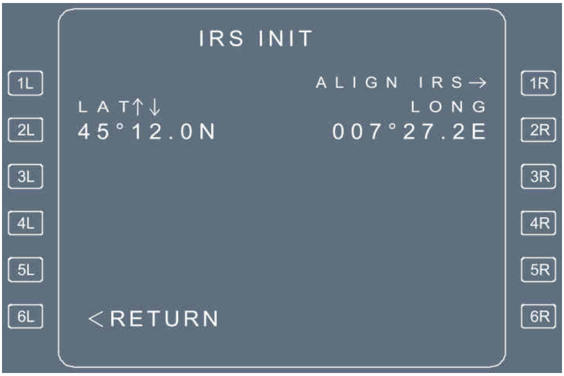
TITLE	Idents for the city pair inserted on the INIT A page. If the flight crew accesses this page from an OTHER ALTN, this field displays the primary destination and the other alternate city pair. (The numbers in the upper righthand corner are the total number of company routes from this city pair stored in the data base).
[1L]	This field shows the name of the company route displayed on the page.
Line 2 to Line 5	These fields display the various elements of the company route (waypoints in green large font and airways in white small font).
[6L] RETURN	The pilot presses this key to return to the accessing page.
[6R] INSERT or SELECT	This prompt displays amber INSERT (blue for the secondary flight plan) if the pilot accessed the page from the INIT A (or secondary INIT A) page. It displays SELECT (blue) if the crew accessed the page from the alternate page. The pilot presses this key to insert the displayed company route in the respective flight plan and return the display to the accessing page.

Note: *The pilot can slew the display to show the rest of the route if one page does not show it all, or to display other company routes for this city pair.*

IRS INIT PAGE

Ident.: DSC-22_20-50-10-25-00006668.0001001 / 17 MAR 11
Applicable to: LV-GKO, LV-GKP

The pilot uses the IRS INIT page to align the inertial reference system. The pilot accesses this page by pressing the IRS INIT key on the INIT A page.



IRS INIT

ALIGN IRS→

LAT↑↓ LONG

45°12.0N 007°27.2E

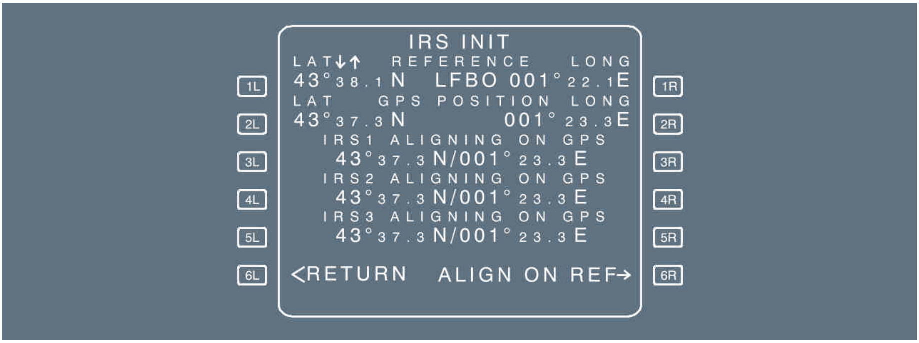
<RETURN

[2L] LAT	This field displays the latitude of the departure airport’s reference point. The pilot may modify it by slewing or overwriting.
[6L] RETURN	This prompt enables the pilot to return to the INIT A page.
[1R] ALIGN IRS	This field only displays this legend, if the LAT and LONG fields are filled in, and at least one of the inertial reference systems is in ALIGN status (IRS in NAV position and alignment process not over). If the pilot presses this key, when its field is displaying this legend, the present coordinates are sent to the IRSs and this completes the alignment process. If one of the three IRSs indicates an ALIGN FAULT occurence, the prompt becomes REALIGN IRS.
[2R] LONG	This field displays the longitude of the departure airport’s reference point. The pilot may modify it by slewing, or overwriting.

IRS INIT PAGE

Ident.: DSC-22_20-50-10-25-00006668.0003001 / 01 OCT 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The flight crew uses the IRS INIT page to align the inertial reference system. The flight crew accesses this page by pressing the IRS INIT key on the INIT A page.



```
          IRS INIT
LAT↓↑     REFERENCE      LONG
43°38.1N   LFBO 001°22.1E
LAT    GPS POSITION      LONG
43°37.3N           001°23.3E
    IRS1 ALIGNING ON GPS
    43°37.3N/001°23.3E
    IRS2 ALIGNING ON GPS
    43°37.3N/001°23.3E
    IRS3 ALIGNING ON GPS
    43°37.3N/001°23.3E
<RETURN      ALIGN ON REF→
```

Line 1 LAT-REFERENCE-LONG	This line provides the latitude and longitude of the FM reference position. This reference is extracted from the navigation database. The flight crew can modify this reference. Only when the FM reference position matches the origin airport position, the airport identifier is displayed in green. Otherwise, there are dashes at the place of the airport identifier. Latitude and longitude of the FM reference position are displayed in blue. The flight crew can modify the latitude and longitude values using the scroll keys.
Line 2 LAT-GPS POSITION-LONG	This line displays the GPS position latitude and longitude.
Line 3 to 5	These lines display the IRS 1-2-3 alignment state, source and latitude/longitude. The alignment status can be ALIGNING ON XXX, or ALIGNED ON XXX or IN ATT. XXX is the alignment source and can be GPS or CDU or REF. It is displayed in white font. The latitude and longitude values are displayed in green.
[6L] RETURN	This prompt enables the flight crew to return to the INIT A page.

[6R]	If a reference is available, the field displays ALIGN ON REF → in blue, which is replaced by CONFIRM ALIGN *, in amber when 6R prompt is pressed. Pressing again the 6R prompt enables the transmission of the FM reference position displayed in line 1.

WIND PAGES

Ident.: DSC-22_20-50-10-25-A-00006672.0001001 / 18 MAR 11
Applicable to: ALL

GENERAL

Winds in climb, cruise, descent and approach are necessary to provide the pilot with reliable predictions and performance. Wind pages enable the pilot to enter and/or review the winds propagated by the FMGES or sent by ACARS ◁ or ATSU ◁ for the various flight phases.

Note: On WIND pages, wind direction is always true referenced.

Ident.: DSC-22_20-50-10-25-A-00006677.0001001 / 01 MAR 18
Applicable to: ALL

CLIMB WIND PAGE

This page enables the pilot to enter and/or review predicted wind vectors (direction and velocity) at up to 5 different levels.
CLIMB WIND page is accessed from:

TITLE	CLIMB WIND in white large font.
[1L] to [5L] TRU WIND/ALT	This field displays the winds entered at various climb altitudes in blue color before climb phase activation and in green color after climb phase activation. This field may also display history winds or uplink winds. Large blue brackets are displayed before any wind entry. Pilot entered and uplinked winds are displayed in large font, history wind data in small font. Upon sequencing the top of climb, the climb winds are deleted. *Note: Climb winds are not deleted when the origin airport is changed.*
[1R] HISTORY WIND	Displayed in preflight phase only. This key calls up the history wind page. This page is not modifiable (green small font) but can be inserted into the CLIMB WIND page using the 6R key and modified accordingly.

[2R] WIND REQUEST*	Pressing this key sends a request for ACARS winds. This prompt is active only on ACARS equipped aircraft.
[5R] NEXT PHASE	Pressing this key calls up the CRUISE WIND page or the DESCENT WIND page if no cruise waypoint exists.

TITLE	CRUISE WIND AT in white large font.
[1L] T. WIND/ALT to [4L]	These fields display in blue the entered wind at various altitudes. The entered winds are propagated at the same altitude to the downpath cruise waypoints, if no other winds are entered. The propagated wind direction and velocity are displayed in small fonts. Both uplinked winds and pilot entered winds are displayed in blue large font. Wind data are modifiable during the cruise.
[5L] SAT/ALT	This field allows the pilot to enter a temperature at a given flight level, or displays a propagated value. The crew must enter both temperature and altitude at the first entry. He can then modify independantly the temperature or the altitude.
[2R] WIND REQUEST*	Pressing this key sends a request for ACARS winds.
[4R] PREV PHASE	This prompt is displayed in Preflight, Takeoff, Climb and Done phases. Pressing this prompt calls up the CLIMB WIND page.

[5R] NEXT PHASE	Pressing this prompt calls up the DES WIND page. Any new entry performed on the CRUISE WIND page is immediately inserted into the corresponding flight plan. Predictions are dashed on the F-PLN pages during the recomputation time. CRUISE WIND page reverts automatically to F-PLN page if a temporary flight plan is created or the secondary flight plan is activated.

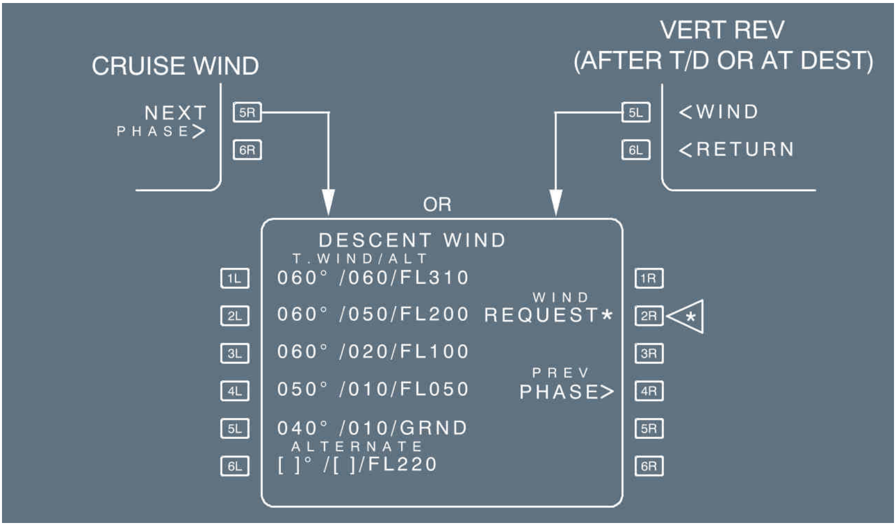
TITLE	CRZ WIND AT in white large font.

[1L] T. WIND/ALT to [4L]	These fields display in blue the entered wind at various altitudes. The entered winds are propagated at the same altitude to the downpath cruise waypoints, if no other winds are entered. The propagated wind direction and velocity are displayed in small fonts. Both uplinked winds and pilot entered winds are displayed in blue large font. Wind data are modifiable during the cruise.
[5L] SAT/ALT	This field allows the pilot to enter a temperature at a given flight level, or displays a propagated value. The crew must enter both temperature and altitude at the first entry. He can then modify independantly the temperature or the altitude.
[2R] WIND REQUEST*	Pressing this key sends a request for ACARS winds.
[4R] PREV PHASE	This prompt is displayed in Preflight, Takeoff, Climb and Done phases. Pressing this prompt calls up the CLIMB WIND page.
[5R] NEXT PHASE	Pressing this prompt calls up the DES WIND page. Any new entry performed on the CRZ WIND page is immediately inserted into the corresponding flight plan. Predictions are dashed on the F-PLN pages during the recomputation time. CRZ WIND page reverts automatically to F-PLN page if a temporary flight plan is created or the secondary flight plan is activated.

Ident.: DSC-22_20-50-10-25-A-00006693.0001001 / 01 MAR 18
Applicable to: ALL

DESCENT WIND PAGE

This page allows the pilot to define and display the winds used for computing the descent profile. The pilot calls it up by selecting NEXT PHASE on the CRUISE WIND page or WIND prompt on VERT REV page.



```
         DESCENT WIND
 T.WIND/ALT
060° /060/FL310
                       WIND
060° /050/FL200  REQUEST*
060° /020/FL100
                       PREV
050° /010/FL050    PHASE>
040° /010/GRND
 ALTERNATE
[ ]° /[ ]/FL220
```

[1L] to [5L]	This field displays inserted winds or uplinked winds in large blue font prior to activating the descent phase (modifiable values) and in green after descent phase activation (non-modifiable values). An entry of "GRND" in the "ALT" field is seen as the wind at ground level. This wind is copied on the PERF APPR page (and corrected for the magnetic variation). A clear action on one key reverts the line to blue bracket.
[6L] ALTERNATE	This field is displayed only when an alternate is defined. The pilot-entered value or uplinked value is displayed in large blue font. Always modifiable by the pilot.
[2R] WIND REQUEST*	Pressing this key sends a request for ACARS winds. This prompt is active only on ACARS <* or ATSU <* equipped aircraft.
[4R] PREV PHASE	Pressing this key calls up the CRUISE WIND page. The field is erased after the top of descent has sequenced.

Note: *Descent winds and alternate wind are deleted if the destination airport is changed.*

INIT FUEL PRED PAGE

Ident.: DSC-22_20-50-10-25-00006695.0005001 / 01 MAR 18
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

This page is used to initialize the Gross Weight and Center of Gravity values, before starting the engines.

As long as the engines have not been started, the flight crew can call up this page:
- from the INIT A page by pressing the "→" or "←" key on the MCDU, or
- by pressing the FUEL PRED key on the MCDU.

This page automatically reverts to the FUEL PRED page, after the first engine is started. The FMGEC will stop using the flight crew-entered block fuel and will compute its predictions based on the FOB indicated by the FCMC (or the FE as backup) from that moment on.

[1L] TAXI (blue)	This is the taxi fuel, that defaults to a preset value (usually 400 kg or 800 lb). The flight crew can change the value through this field.
[2L] TRIP/TIME (green)	This field displays the trip fuel and time when predictions are available. The flight crew cannot modify these values.
[3L] RTE RSV/% (blue)	This field displays the contingency fuel for the route and the corresponding percentage of trip fuel. It may be equal to 0.0, if such is the policy of the operator. The flight crew can either enter a fuel quantity, or a percentage.

[4L] ALTN/TIME (blue/green)	This field displays alternate trip fuel and time, assuming that the Cost Index = 0 and that the aircraft flies at the default cruise flight level. The flight crew can modify the alternate fuel as required. In this case, alternate time will be dashed.
[5L] FINAL/TIME (blue)	Displays the final reserve fuel and time calculated at the alternate airport (or destination airport, if selected in the “airline fuel policy” section of the AMI). Before any flight crew entry, the FINAL field is dashed and FINAL TIME field is defaulted to the value specified in the AMI file (typically 30 min). The flight crew may enter a final fuel or time, and the system will compute associated holding time/fuel available. The system assumes a holding pattern at 1 500 ft AGL, with the aircraft in CONF 1 at maximum endurance speed (racetrack pattern, altitude and selected airport can be modified through the “airline fuel policy” section of the AMI).
[6L] MIN DEST FOB (blue)	Displays the expected minimum fuel at destination. It is equal to the ALTN + FINAL fuel. This field can be modified by the flight crew, and is also impacted by the modification of ALTN and/or FINAL fuel. Note: *If flight crew entry of MIN DEST FOB is lower than ALTN + FINAL fuel, the message “CHECK MIN DEST FOB” is triggered on the MCDU.*
[1R] ZFW/ZFWCG (blue)	Displays the Zero Fuel Weight (ZFW) and Zero Fuel Weight CG (ZFWCG). The flight crew must enter the ZFW/ZFWCG values (as appropriate) to obtain a speed profile and predictions. Note: *If the flight crew enters a ZFW value that exceeds the acceptable range as defined in the performance data base, the “ENTRY OUT OF RANGE” message appears and the value is rejected.*
[2R] BLOCK	The block fuel in this field is a mandatory entry.
[3R] FUEL PLANNING (amber)	Pressing this key initiates an FMGEC block fuel computation using current hypothesis and extra = 0. When the flight crew selects this function, FUEL PLANNING becomes green, and the BLOCK field is dashed during FMGEC computation. The title of the page changes to INIT FUEL PLANNING, and BLOCK CONFIRM* replaces the FUEL PLANNING prompt, when the block fuel is computed by the FMGEC. If the flight crew modifies the parameters used for the prediction computation before confirmation, the computation restarts automatically and FUEL PLANNING is displayed in green.

[4R] TOW/LW (green)	Displays the computed Takeoff Weight (TOW) and Landing Weight (LW) at the primary destination. This cannot be modified.
[5R] TRIP WIND (blue)	This field allows the entry of a mean wind component for the trip from the origin to the destination. Upon entry of a CO RTE or FROM/TO pair, this field defaults to HD 000 in small font. An entry preceeded by –, H, HD is considered to be headwind, +, T, TL to be tailwind. The entered speed is displayed in large blue font. When the flight crew inserts a wind on the CLIMB, CRUISE or DESCENT WIND page or on the PERF APP page, the system no longer considers the trip wind, and the corresponding field is dashed.
[6R] EXTRA/TIME (green)	Displays the amount of extra fuel, and the resulting time available for holding over the primary destination. EXTRA FUEL = BLOCK – (TAXI + TRIP + RSV + MIN DEST FOB). The field displays its information in small font, and it cannot be modified by the flight crew.

INIT B PAGE

Ident.: DSC-22_20-50-10-25-00006695.0004001 / 01 MAR 18
Applicable to: LV-KHT, LV-KHU

This page is used to initialize the Gross Weight and Center of Gravity values, before starting the engines.
The flight crew can call it up from the INIT A page, by pressing the “→” or “←” key on the MCDU, as long as the engines have not been started.
This page automatically reverts to the FUEL PRED page, after the first engine is started. The FMGEC will stop using the flight crew-entered block fuel and will compute its predictions based on the FOB indicated by the FCMC (or the FE as backup) from that moment on.

[1L] TAXI	This is the taxi fuel, which defaults to a preset value, (usually 400 kg or 800 lb). The pilot can change the value through this field.
[2L] TRIP/TIME (green)	This field displays trip fuel and time when predictions become available. The pilot cannot modify this data.

[3L] RTE RSV/% (blue)	This field displays the reserve fuel for the route and the corresponding percentage of trip fuel. It may be blank, if such is the policy of the operator. The pilot can either enter a route reserve, or a percentage, and the system then automatically computes the nominal value.
[4L] ALTN/TIME (green)	This field displays alternate trip fuel and time, assuming that the Cost Index = 0 and that the aircraft flies at the default cruise flight level. This field displays information in small font, and the flight crew cannot modify it.
[5L] FINAL/TIME	This field displays the hold fuel and time, associated with continued flight to the alternate airport (or destination airport, if selected in the “airline fuel policy” section of the database). The pilot may enter a final fuel or time, and the system will compute associated holding time/fuel available. The system assumes that the holding will be in a racetrack pattern, 1 500 ft above the alternate airport, for 30 min, with the aircraft in CONF 1 at maximum endurance speed (racetrack pattern, altitude and selected airport can be modified through the “airline fuel policy” section of the database).
[6L] EXTRA/TIME (green)	This field displays the amount of extra fuel, and the available time it represents for holding over to the alternate or primary destination, if the pilot did not define an alternate. EXTRA FUEL = BLOCK – (TAXI + TRIP + RSV + ALTN + FINAL). The field displays information in small font, and the flight crew cannot modify it.
[1R] ZFWCG/ZFW	The zero fuel weight and the location of the zero fuel weight CG are mandatory entries that allow the system to compute speed management and predictions. The pilot can modify this data.
[2R] BLOCK	The block fuel in this field is a mandatory entry that allows the system to predict the Estimated Fuel on Board (EFOB). When the pilot enters a block fuel, the title of the page changes to INIT FUEL PREDICTION. The FMGEC may also compute the block, if the pilot selects the FUEL PLANNING function.
[3R] FUEL PLANNING (amber)	Pressing this key initiates an FMGEC block fuel computation. When the pilot selects this function, FUEL PLANNING becomes green, and the BLOCK field is dashed during FMGEC computation. The title of the page changes to INIT FUEL PLANNING, and BLOCK CONFIRM* replaces the FUEL PLANNING prompt, when the block fuel is computed by the FMGEC. If the pilot modifies the parameters used for the prediction computation before confirmation, the computation restarts automatically and FUEL PLANNING is displayed in green.

Note: *If the pilot enters a number in field 1R or 2R that exceeds the limits, the field displays “ENTRY OUT OF RANGE” and does not accept the value.*

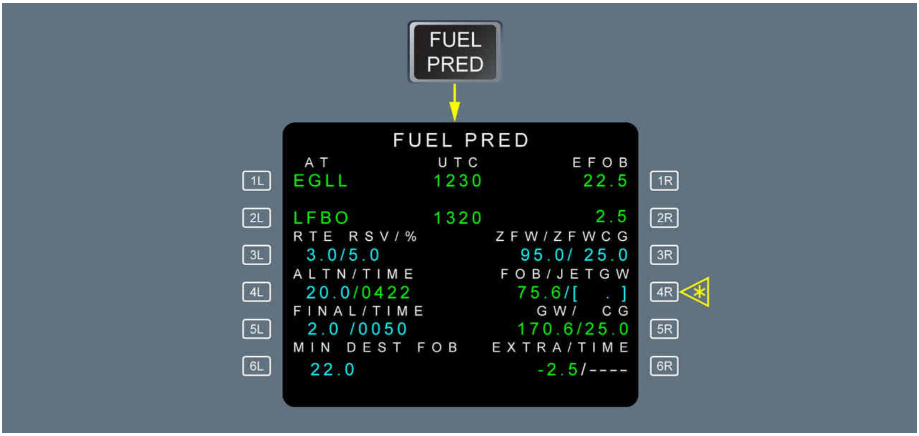
[4R] TOW (green)	This field displays the computed takeoff weight. The pilot cannot modify it (small font).
[5R] LW (green)	This field displays the computed landing weight at the primary destination. The pilot cannot modify it (small font).
[6R] TRIP WIND	This field allows the entry of a mean wind component for the trip from the primary origin to the primary destination. Upon entry of a CO RTE or FROM/TO pair, this field defaults to HD 000 in blue small font. An entry preceeded by –, H, HD is considered as headwind, +, T, TL as tailwind. The entered velocity is displayed in blue large font. As soon as the crew inserts a wind on the CLIMB, CRUISE or DESCENT WIND page, the SYSTEM no longer considers the trip wind.

FUEL PREDICTION PAGE

Ident.: DSC-22_20-50-10-25-00006719.0005001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

The FUEL PRED page displays fuel prediction information at destination and alternate, as well as fuel management data after the engines are started. The flight crew accesses the FUEL PRED page, by pressing the FUEL PRED key on the MCDU. The flight crew may also select a final gross weight value for jettison operation.

Note: *After engine start, the flight crew can also call up this page by pressing the “→” key on the MCDU when on the INIT A page.*



```
           FUEL PRED
 AT            UTC          EFOB

MIN DEST FOB         EXTRA/TIME
 22.0                  -2.5/----
```

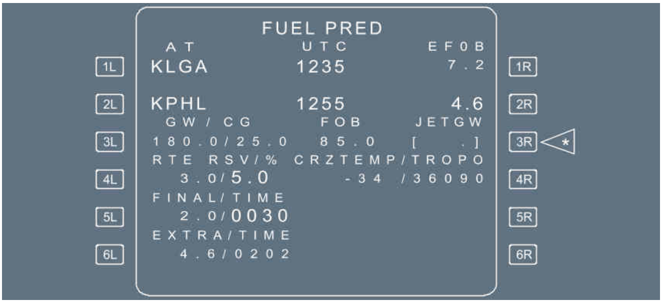
[1L] – [1R] AT/UTC–TIME/EFOB	Display time and fuel predictions to the primary destination. TIME is displayed before takeoff. UTC predictions are displayed after takeoff. If the flight crew has entered an ETT, the UTC is displayed. The EFOB at destination will turn to amber if it becomes less than the MIN DEST FOB value.
[2L] – [2R] AT/UTC–TIME/EFOB	These lines display time and fuel predictions to the alternate airport (*Refer to DSC-22_20-30-10-15 Alternate Function - Review and Selection of Alternate Airport*).
[3L] RTE RSV/%	Before departure, this field displays the route reserve fuel and the corresponding percentage of trip fuel. It may be equal to 0.0, if such is the policy of the operator. The flight crew can either enter a fuel quantity or a percentage. After takeoff, 0.0/0.0 is displayed and the corresponding fuel is added to the extra fuel.
[4L] ALTN/TIME	Displays alternate trip fuel and time, assuming that the cost index is equal to 0 and that the aircraft flies at the default cruise flight level (*Refer to DSC-22_20-30-10-15 Alternate Function - Review and Selection of Alternate Airport*). The flight crew can modify the alternate fuel as required. In this case, alternate time will be dashed.
[5L] FINAL/TIME	Displays the final reserve fuel and time calculated at the alternate airport (or destination airport, if selected in the “airline fuel policy” section of the AMI). The flight crew may enter a final fuel or time, and the system will compute associated holding time/fuel available. The system assumes a holding pattern at 1 500 ft AGL, with the aircraft in CONF1 at maximum endurance speed (racetrack pattern, altitude and selected airport can be modified through the “airline fuel policy” section of the AMI).
[6L] MIN DEST FOB	Displays the expected Minimum Fuel at Destination. It is equal to the FINAL + ALTN fuel. The field can be modified directly by the flight crew, and is also impacted by the modification of the ALTN and/or the FINAL fuel.
[3R] ZFW/ZFWCG	Displays the ZFW and ZFWCG values, as entered before engine start on the INIT FUEL PRED page. The flight crew can re-enter or modify these values after engine start on the FUEL PRED page. If, at engine start, no ZFW or ZFWCG values have been entered, amber boxes are displayed in the corresponding field. The flight crew must enter the ZFW/ZFWCG values to obtain a speed profile and predictions.

[4R] FOB/JET GW ◁*	This field displays the FOB calculated by the FCMC (or FE as backup). This field cannot be modified. The flight crew enters the jettison final gross weight in this field. The FCMC uses this value to stop jettison, when activated.
[5R] GW/CG	The FMS continuously updates the GW and CG during the flight. The field displays dashes, as long as the system is not calculating the FOB, or ZFW has not been entered by the flight crew. The field cannot be modified.
[6R] EXTRA/TIME	Displays the amount of extra fuel, and the resulting time available for holding over the primary destination. EXTRA FUEL = FOB – (TAXI + TRIP + RSV + MIN DEST FOB). This field displays its information in small green font, and it cannot be modified by the flight crew.

FUEL PREDICTION PAGE

Ident.: DSC-22_20-50-10-25-00006719.0002001 / 21 MAR 16
Applicable to: LV-GKO, LV-GKP

The pilot presses the FUEL PRED key on the MCDU console to display fuel prediction information at destination (DEST) and alternate (ALTN), as well as fuel management data after the engines are started. The pilot may also select a final Gross Weight value for jettison operation.



```
              FUEL PRED
  AT           UTC            EFOB
KLGA          1235             7.2

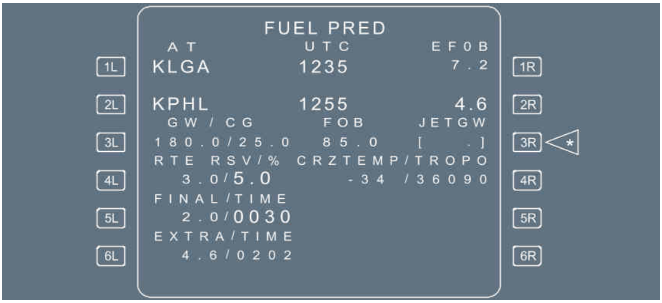
   3.0/5.0           -34  /36090
FINAL/TIME
   2.0/0030
EXTRA/TIME
   4.6/0202
```

Line 1 AT-UTC/TIME-EFOB	These fields display predictions of time and fuel to the primary destination. TIME is displayed before takeoff, UTC predictions after takeoff. After the pilot enters an Estimated Takeoff Time (ETT), the UTC is displayed.
Line 2 AT-UTC/TIME-EFOB	These fields display predictions of time and fuel to the alternate airport. (*Refer to DSC/22_20 Auto Flight - Flight Management / 30 Flight Planning / 10 Lateral Fonctions / Alternate Fonction* for details).

[3L] GW/CG	GW The system continually updates gross weight during the flight. If no zero fuel weight has been entered, the screen displays amber boxes next to this key. The pilot must enter information in these boxes in order to obtain a speed profile, speed computations, and predictions. The field displays dashes, as long as the system is not calculating fuel on board. CG The system continually updates the center of gravity location along the flight path. If no center of gravity has been entered, the screen displays amber boxes next to this key. The pilot must enter information in these boxes in order to obtain a speed profile, speed computations and predictions. The pilot can modify both the GW and CG.
Line 3 FOB	This field displays the fuel on board, computed by the FCMC (or FE as backup). The flight crew cannot modify this number.
[4L] RTE RSV/%	Prior to departure, this field displays the route reserve fuel and the corresponding percentage of trip fuel. After takeoff, it displays the percentage of the remaining trip fuel from the present position to the destination. The field may be blank, depending on the fuel policy of the operating airline. The crew can enter either a RTE RSV or a RTE RSV %. The system automatically computes the other value.



```
              FUEL PRED
  AT             UTC            EF0B
KLGA             1235            7.2

KPHL             1255            4.6

FINAL/TIME
   2.0/0030
EXTRA/TIME
   4.6/0202
```

[5L] FINAL/TIME	This field displays the hold fuel and time, associated with continued flight to the alternate airport (or destination airport, if selected in the “airline fuel policy” section of the database). The pilot may enter a final fuel or time, and the system will compute associated holding time/fuel available. The system assumes that the holding will be in a racetrack pattern, 1 500 ft above the alternate airport, for 30 min, with the aircraft in CONF1 at maximum endurance speed (racetrack pattern, altitude and selected airport can be modified through the “airline fuel policy” section of the database).
[6L] EXTRA/TIME	This field displays the amount of extra fuel, and the resulting time available for holding over the primary destination. EXTRA FUEL = BLOCK – (TAXI + TRIP + RSV + ALTN + FINAL) The pilot cannot modify this field (displayed in small green font).
[3R] JET GW ◁*	When the FMS Fuel Jettison option is activated, the flight crew can enter the jettison final gross weight in this field. The FCMC uses this value to stop jettison.
[4R] CRZ TEMP/TROPO	This field displays the temperature at the cruise flight level and the altitude of the tropopause. The tropopause defaults to 36 090 ft. The pilot can modify both values. The field is dashed, when the aircraft sequences the top of climb.

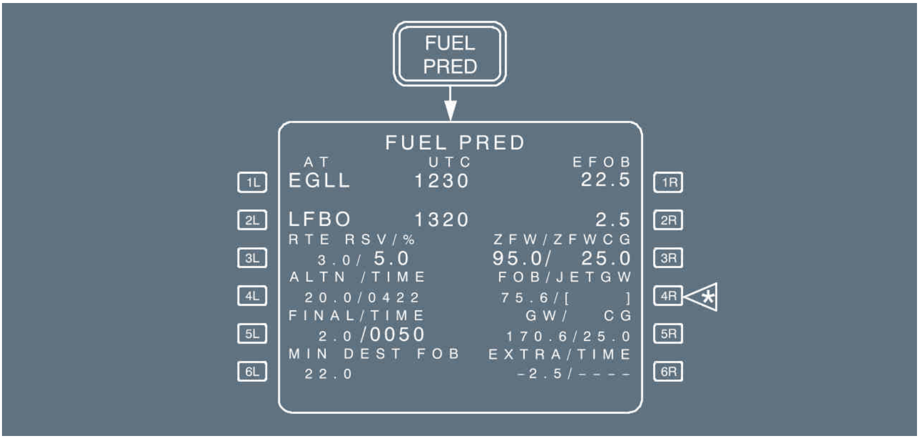
Note: *All fields, except [3R], [4R], [5R] and [6R], show dashes until the flight crew starts an engine.*

FUEL PREDICTION PAGE

Ident.: DSC-22_20-50-10-25-00006719.0004001 / 17 JUN 14
Applicable to: LV-KHT, LV-KHU

The FUEL PRED page displays fuel prediction information at destination and alternate, as well as fuel management data after the engines are started. The flight crew accesses the FUEL PRED page, by pressing the FUEL PRED key on the MCDU. The flight crew may also select a final Gross Weight value for jettison operation.

Note: *The flight crew can also call up this page by pressing the “→” key on the MCDU when on the INIT A page.*



```
           FUEL PRED

  22.0                -2.5/----
```

[1L] – [1R] AT/UTC–TIME/EFOB (green)	Display time and fuel predictions to the primary destination. TIME is displayed before takeoff. UTC predictions are displayed after takeoff. If the flight crew has entered an Estimated Takeoff Time (ETT), the UTC is displayed. The EFOB at destination will turn to amber if it becomes less than the MIN DEST FOB value.
[2L] – [2R] AT/UTC–TIME/EFOB	These lines display time and fuel predictions to the alternate airport. (*Refer to DSC-22_20-30-10-15 Alternate Function - Review and Selection of Alternate Airport*).
[3L] RTE RSV/% (blue)	Before departure, this field displays the route reserve fuel and the corresponding percentage of trip fuel. It may be equal to 0.0, if such is the policy of the operator. The flight crew can either enter a fuel quantity or a percentage. After takeoff, it becomes green 0.0/0.0 and the corresponding fuel is added to the EXTRA fuel.
[4L] ALTN/TIME (blue/green)	Displays alternate trip fuel and time, assuming that the Cost Index = 0 and that the aircraft flies at the default cruise flight level. (*Refer to DSC-22_20-30-10-15 Alternate Function - Review and Selection of Alternate Airport*). The flight crew can modify the alternate fuel as required. In this case, alternate time will be dashed.

[5L] FINAL/TIME (blue)	Displays the final reserve fuel and time calculated at the alternate airport (or destination airport, if selected in the “airline fuel policy” section of the AMI). The flight crew may enter a final fuel or time, and the system will compute associated holding time/fuel available. The system assumes a holding pattern at 1 500 ft AGL, with the aircraft in CONF1 at maximum endurance speed (racetrack pattern, altitude and selected airport can be modified through the “airline fuel policy” section of the AMI).
[6L] MIN DEST FOB (blue)	Displays the expected Minimum Fuel at Destination. It is equal to the FINAL + ALTN fuel. The field can be modified directly by the flight crew, and is also impacted by the modification of the ALTN and/or the FINAL fuel.
[3R] ZFW/ZFWCG (blue)	Displays the Zero Fuel Weight (ZFW) and Zero Fuel Weight Center of Gravity (ZFWCG) values, as entered before engine start on the INIT B page. The flight crew can re-enter or modify these values after engine start on the FUEL PRED page. If, at engine start, no ZFW or ZFWCG values have been entered, amber boxes are displayed in the corresponding field. The flight crew must enter the ZFW/ZFWCG values to obtain a speed profile and predictions.
[4R] FOB (green) / JET GW ◁	This field displays the Fuel On Board calculated by the FCMC (or FE as backup). This field cannot be modified. The flight crew enters the jettison final gross weight in this field. The FCMC uses this value to stop jettison, when activated.
[5R] GW/CG (green)	The FMS continuously updates the Gross Weight (GW) and Center of Gravity (CG) during the flight. The field displays dashes, as long as the system is not calculating the Fuel On Board, or ZFW has not been entered by the flight crew. The field cannot be modified.
[6R] EXTRA/TIME (green)	Displays the amount of extra fuel, and the resulting time available for holding over the primary destination. EXTRA FUEL = FOB – (TAXI + TRIP + RSV + MIN DEST FOB). This field displays its information in small green font, and it cannot be modified by the flight crew.

Note: *All fields are dashed before engines are started.*

FLIGHT PLAN PAGES

Ident.: DSC-22_20-50-10-25-B-00006733.0001001 / 16 MAR 11
Applicable to: ALL

These pages display all waypoints of the active and alternate flight plans, along with associated predictions.
The pilot can make all revisions to the lateral and vertical flight plans through these pages. He presses the left key to revise the lateral flight plan and the right key to revise the vertical flight plan.
He presses the F-PLN key on the MCDU console to gain access to the A page of the active flight plan.

Ident.: DSC-22_20-50-10-25-B-00006745.0001001 / 19 DEC 12
Applicable to: LV-GKO, LV-GKP

FLIGHT PLAN A PAGE

The A page displays time, speed, and altitude predictions for each waypoint of the active flight plan.

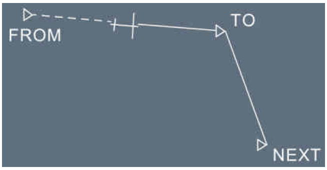
TITLE	FLIGHT NUMBER (blank if no flight number has been entered) This line may display yellow TMPY if a temporary flight plan exists, white OFST, if a lateral offset is flown or yellow OFST if a lateral offset revision is pending.
Line 1 to 5 WPT, UTC, SPD/ALT	These lines display consecutive waypoints along with associated predictions of time, speed or Mach and altitude for each. TIME is displayed before takeoff and UTC after takeoff. After the pilot enters an estimated takeoff time (ETT), UTC is displayed. The time and flight level display at the FROM waypoint (first line of the flight plan) are values that the system memorized at waypoint sequencing.

[1R] SPD ALT	The field dedicated to SPEED or MACH is blank at the FROM waypoint except at airport of departure. (V1 is displayed associated with runway elevation).
Line 6 DEST, UTC/TIME, DIST, EFOB	DIST is the distance to the destination along the displayed flight plan. EFOB is the estimated fuel on board at the destination. The sixth line is permanent and is displayed in a white font once predictions are available, except when a TMPY F-PLN is displayed or when an ALT CSTR is entered (* CLB or DES*) prompt appears).

Note: The predicted altitude at a waypoint is related to the QNH below the transition altitude and is given as a flight level above the transition altitude.



The generic flight plan page displays the FROM waypoint (last waypoint to be overflown) on the first line and the TO waypoint in white on the second line. The FROM/TO flight plan leg is called the active leg.
The flight crew can use the scrolling keys to review all flight plan legs down to the last point of the alternate flight plan. The AIRPORT key serves as a fast slew key ; the pilot can press it to call up the next airport (DEST, ALTN, ORIGIN) to be displayed on the flight plan page.
In order to return to the beginning of the flight plan page, the pilot presses the F-PLN key on the MCDU console.
The display shows the name of the leg between two waypoints and the distance between them on a line between the lines that identify them. During an approach, this in-between line also defines the angle of the final descent path. For example, “2-3 °” indicates that the leg is two nautical miles long, and the flight path angle is –3 °.
The display shows the bearing between FROM and TO waypoints as the bearing from the aircraft position to the TO waypoint. It shows track (TRK) between the waypoints shown in lines 2 and 3. This is the outbound track of the next leg.
When TRUE is selected or when entering the polar area, the degree symbol is replaced by “T”.
If the data base contains a published missed-approach procedure, or if someone has inserted one manually, the display shows it in blue after the destination runway identification. It turns green when the go-around phase becomes active.
After the last waypoint of the missed approach, the display shows the alternate flight plan in NAV mode.

When airborne, the flight crew can clear or modify the TO waypoint only by using the DIR key on the MCDU console.

PREDICTIONS

The system calculates and displays predictions for all waypoints.

CONSTRAINTS

The database may define an altitude constraint and speed constraint for each waypoint of the climb, descent, and approach phases, or the pilot may insert such constraints manually. (Except at origin, destination, FROM and pseudo waypoints).
The constraints are displayed in magenta as long as predictions are not completed.
Once predictions are available, constraints are replaced by speed and altitude predictions preceded by stars. If the star is magenta the system is predicting that the aircraft will match the constraint (altitude within 250 ft, speed not more than 10 kt above the constraints). If the star is amber, the system is predicting that the aircraft will miss the constraint and the MCDU displays “SPD ERROR AT WPT” message.

PSEUDO WAYPOINTS

Pseudo waypoints are computed geographical positions corresponding to an event in the vertical flight plan ; T/C (top of climb), T/D (top of descent), SPD/LIM (speed limit), DECEL (deceleration for approach) etc. The display shows them as waypoints in parentheses.

APPROACH DISPLAY

The flight crew cannot enter an altitude constraint at the destination or MAP (Missed Appraoch Point).

TITLE	FLIGHT NUMBER (blank, if no flight number has been entered). This line may display OFST in white, if a lateral offset is flown. It may display yellow TMPY if a temporary flight plan exists.

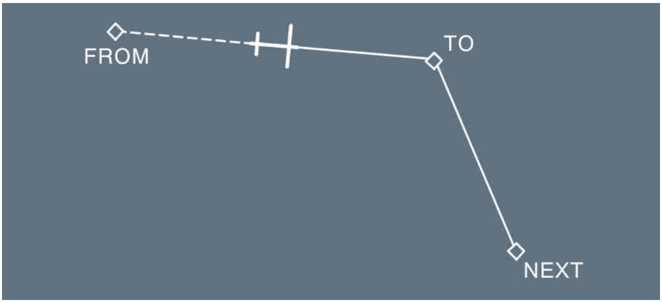
Line 1 to Line 5 WPT, UTC, SPD, ALT	These lines display consecutive waypoints, along with associated predictions of time, speed or Mach and altitude for each. TIME is displayed before takeoff, and UTC after takeoff. After the pilot enters an Estimated Takeoff Time (ETT), UTC is displayed. The time and flight level display at the FROM waypoint (first line of the flight plan) are values that the system memorized at waypoint sequencing.
[1R] SPD/ALT	The field dedicated to SPEED or MACH is blank at the FROM waypoint, except at the departure airport. (V1 associated with runway elevation, is displayed).

Note: *When the aircraft approaches a holding pattern the IMM EXIT or RESUME HOLD prompt will replace the SPD/ALT field.*

Note: *The predicted altitude at a waypoint is related to the QNH below the transition altitude, and is given as a flight level above the transition altitude.*

Line 6, DEST UTC/TIME DIST, EFOB	DIST is the distance to destination along the displayed flight plan. EFOB is the Estimated Fuel on Board at destination. The EFOB at destination will turn to amber, if it becomes less than the MIN DEST FOB value. The sixth line is permanent and is displayed in white font, once predictions are available, except when a TMPY F-PLN is displayed, or in some cases when an ALT CSTR is entered ("← CLB or DES →" prompt appears).

The generic flight plan page displays the FROM waypoint (last waypoint overflown) on the first line, and the TO waypoint (in white) on the second line. The FROM/TO flight plan leg is called the active leg.



The flight crew can use the scroll keys to review all flight plan legs down to the last point of the alternate flight plan. The AIRPORT key serves as a fast scroll key. The pilot can press it to call up the next airport (DEST, ALTN, ORIGIN) to be displayed on the flight plan page.

In order to return to the beginning of the flight plan page, the pilot presses the F-PLN key on the MCDU console.
The display shows the name of the leg between two waypoints, and the distance between them on a line between the lines that identify them. During an approach, this in-between line also defines the angle of the final descent path. For example, “2-3 °” indicates that the leg is 2 NM long, and the flight path angle is -3 °.
The display shows the bearing between FROM and TO waypoints as the bearing from the aircraft position to the TO waypoint. It shows track (TRK) between the waypoints shown in lines 2 and 3. This is the outbound track of the next leg.
When TRUE is selected or when entering the polar area, the degree symbol is replaced by “T”.
If the database contains a published missed approach procedure, or if one has been inserted manually, the display shows it in blue after the destination runway identification. It turns green when the Go-around phase becomes active.
After the last waypoint of the missed approach, the display shows the alternate flight plan.
When NAV mode is engaged, the flight crew can only clear or modify the TO waypoint by using the DIR key on the MCDU console.

PREDICTIONS

The FMS calculates and displays predictions at all F-PLN waypoints.
It uses the current wind and the predicted winds to compute the predictions.

CONSTRAINTS

The database can define an altitude constraint and speed constraint for each waypoint of the climb, descent, and approach phases, or the pilot can manually insert such constraints (except at origin, destination, FROM, and pseudo-waypoints).
The constraints are displayed in magenta, until the predictions are completed.
When the predictions are available, the constraints are replaced by speed and altitude predictions preceded by stars. If the star is in magenta, the system predicts that the aircraft will match the constraint (altitude within 250 ft, speed not more than 10 kt above the constraints). If the star is in amber, the system predicts that the aircraft will miss the constraint, and the MCDU displays “SPD ERROR AT WPT”.

Note: *SPD and ALT CSTR can either be entered from the VERT REV page, or directly on the F-PLN A page. Time constraints can only be entered on the RTA page.*

PSEUDO WAYPOINTS

Pseudo-waypoints are geographical positions corresponding to an event in the flight plan: T/C (Top of Climb), T/D (Top of Descent), SPD/LIM (Speed Limit), S/C (Step Climb point), S/D (Step Descent point), DECEL (Deceleration for Approach), Time Markers etc. Pseudo-waypoints are displayed as waypoints in parentheses.

APPROACH DISPLAY

The flight crew cannot enter an altitude constraint at the destination or MAP (Missed Approach Point).

TITLE	FLIGHT NUMBER (blank if no flight number has been entered)
Line 1 to Line 5 WPT-EFOB-WIND	These lines display consecutive waypoints and associated fuel predictions, and the forecast wind profile. The direction of forecast winds is relative to true north. Forecast winds include winds entered by the pilot (large font) and the propagated winds at intermediate waypoints (small font). If the flight crew uses a trip wind, it will be displayed for each waypoint. If no other wind entry is made after takeoff, the FROM waypoint will display the wind actually recorded, and the waypoints downpath will still display the trip wind.
Line 6 DEST-UTC/DIST-EFOB	Identical to F-PLN A page.

LATERAL REVISION PAGES

Ident.: DSC-22_20-50-10-25-C-00006766.0001001 / 03 NOV 21
Applicable to: LV-GKO, LV-GKP

GENERAL

These pages give the flight crew a list of the lateral flight plan revisions that can use to change the flight plan beyond a selected waypoint.
The flight crew calls up these pages from the flight plan pages (A or B) by pressing the left key adjacent to the selected waypoint.
Different lateral flight plan revisions are available for different waypoints.

TITLE	The ident of the waypoint or airport selected for revision, along with its latitude and longitude. If the selected waypoint is the FROM waypoint, the title omits the aircraft latitude and longitude, and displays PPOS (present position) instead.
[1L] DEPARTURE	This prompt gives the flight crew access to the departure pages, where the flight crew can select runways, SIDs, and TRANSs and insert them.
[2L] OFFSET [ ]	This prompt allows the flight crew to enter a lateral offset, left or right, in the flight plan. The offset may be from 1to 50 NM. When the flight crew enters an offset, the OFFSET field becomes yellow and the 6L and 6R fields display ERASE and INSERT. The flight crew can delete an inserted offset by pressing the CLR pushbutton, by entering a zero for the amount of the offset, or by selecting a DIR TO.

[3L] HOLD	This prompt gives the flight crew access to the hold pages.
[4L] ENABLE ALTN	This prompt allows the flight crew to switch to the alternate flight plan at the selected revision waypoint and use it as a new active flight plan. The system never displays this prompt at the FROM waypoint.
[5L] ALTN	This prompt gives the flight crew access to alternate airport page. The system displays it only at the destination.
[6L] RETURN	This prompt returns the display to the flight plan page.
[1R] ARRIVAL	The flight crew uses this prompt to call up the arrival pages, where the flight crew can select and insert RWY, APPR, STAR TRANS and VIA.
[1R] FIX INFO	FIX INFO is only displayed on the lateral revision page at the origin or at the FROM waypoint. This prompt gives the flight crew access to the FIX INFO page.
[2R] LLXING/INCR/NO	This prompt allows the flight crew to create latitude/longitude crossing point. The increment (INCR) ranges from 1 to 20 °, and the number of crossing point (from 1 to 99). This prompt is not displayed for waypoints belonging to the descent procedure.
[3R] NEXT WPT	The flight crew uses this prompt to enter the next waypoint. If this waypoint is a latitude/longitude, or is not in the database nor in the flight crew-defined elements, the display reverts to the NEW WAYPOINT PAGE. For details, *Refer to DSC-22_20-30-10-15 Inserting a Waypoint - General*.
[4R] NEW DEST	The flight crew uses this prompt to enter a new destination. For details, *Refer to DSC-22_20-30-10-15 Inserting a New Destination*.
[5R] AIRWAYS	The flight crew uses this prompt to access the AIRWAYS page.
[6R] INSERT	The system displays this prompt when the flight crew has created a temporary flight plan. The flight crew can use it to activate the temporary flight plan.

Applicable to: ALL

TEMPORARY REVISION

When the pilot selects a lateral revision, the system creates a “Temporary F-PLN” and displays it in yellow on the MCDU and as a yellow dashed line on the ND to allow the pilot to review the data before inserting. As long as the temporary flight plan is not inserted, the previous flight plan is still active and the system guides the aircraft along it.

This page provides access to the RADIAL intercept function.
The reference may be one or more radial bearings based on a given database fix or a pilot defined element.
If the radial intercepts the active flight plan, the intersection point can be converted to a waypoint and inserted into the flight plan. In addition, the ABEAM function may be used.
The FIX INFO page may be accessed from the lateral revision page at origin or at the FROM waypoint.

REF FIX ENTRY
(INITIAL DISPLAY)
ABEAM AND RADIAL INTCPT POINTS

[1L] REF FIX (blue)	Allows entries of the REF FIX. This reference may be any database element (navaid, waypoint, NDB, airport, runway) or a pilot defined element. Prior to entry, amber boxes are displayed.
Line 2 to line 4 RADIAL (blue)	Allows entry of a radial from the REF FIX. If the radial line intersects the active flight plan, the FMGES will compute the time, the along path DTG (Distance To Go) and the altitude at the intersection point (green small font). A blue large star is then displayed to insert the intersection waypoint into the flight plan. This waypoint is not part of the pilot stored elements. Format of the created waypoint is : XXXNNN XXX = 3 first letters of REF FIX ident. NNN = value of the radial

[5L] - [5R] ABEAM	This function enables the pilot to create waypoints on a flight plan (primary or secondary) that are abeam a reference fix. Once computed, the page displays the radial number in green large font. Time, distance and altitude predictions are displayed in green small font. Selecting the key adjacent to the star creates the waypoint and inserts it into the flight plan. The waypoint is identified by AB + the REF FIX ident e.g. AB TLS. Abeam waypoints are not stored in the pilot stored waypoint database.

Note: *Two FIX INFO pages are available, providing the capability to define two different REF FIX elements.*

FIX INFO PAGE

Ident.: DSC-22_20-50-10-25-00006768.0003001 / 01 OCT 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The FIX INFO pages provides access to the RADIAL, CIRCLE and ABEAM intercept functions.
The reference may be a given database fix or a flight crew-defined element.
If the radial, circle or abeam intercepts the active flight plan, the intersection point can be converted to a waypoint and inserted into the flight plan.
The FIX INFO pages may be accessed from the LAT REV page, after performing a lateral revision at the origin airport, or at FROM or at any F-PLN waypoint of the primary flight plan (except Destination).

REF FIX ENTRY
(INITIAL DISPLAY)

ABEAM, RADIAL and CIRCLE INTCPT POINTS

[1L] REF FIX (blue)	Enables entry of the REF FIX. This reference may be any database element (NAVAID, waypoint, NDB, airport, runway) or a flight crew-defined element. Before any entry, amber boxes are displayed.
[2L] – [2R] to [3L] – [3R] RADIAL (blue)	Enables entry of a radial from the REF FIX. If the radial line intersects the active flight plan, the FMGES will compute the time, the along path DTG (Distance To Go), and the altitude at the intersection point (small green font). A large blue star is then displayed to insert the intersection waypoint into the flight plan. This waypoint is not part of the flight crew-stored elements. It is automatically labelled : "XXXNNN" XXX = First 3 letters of the REF FIX IDENT. NNN = value of the radial

[4L] - [4R] RADIUS	This function enables the flight crew to enter a radius that defines a circle around the REF FIX. When the circle intercepts the current flight path, the FMGES will compute the time, the along path distance and the altitude at the first intersection point, from the current aircraft position (small green front). A large blue star is then displayed to insert the intersection waypoint into the flight plan. This waypoint is not part of the flight crew-stored elements. The waypoint is automatically labelled : “DXXXNNN” NNN = Value of the radius XXX = First 3 letters of the REF FIX IDENT.

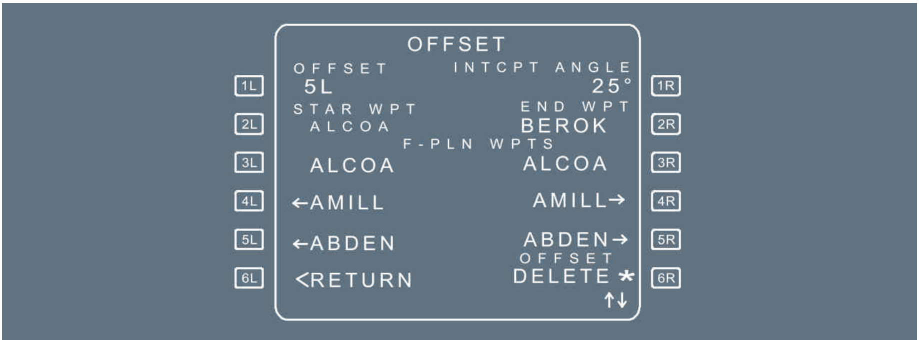
<u>Note:</u> *Four FIX INFO pages, providing the capability to define four different REF FIX elements, are available.*

OFFSET PAGE

Ident.: DSC-22_20-50-10-25-00014242.0001001 / 01 OCT 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

This page allows the flight crew to insert a preplanned offset into the flight plan by entering:
- A start waypoint
- An end waypoint
- An offset distance to the left or to the right
- The intercept angle value.

The flight crew calls up this page from the LATERAL REVISION page, by pressing [2L] key.



```
                OFFSET

```

TITLE	OFFSET in white large font. If a temporary flight plan exists, it is displayed in yellow large font.

[1L] OFFSET	This field displays the lateral offset distance, left or right, in the flight plan. The offset may be between 1 and 50 NM. Blue brackets are displayed until an offset is inserted. When the flight crew enters an offset, or modifies another element in the OFFSET page, the OFFSET field becomes yellow. One time the temporary flight plan is inserted, the field becomes blue. The flight crew can delete an inserted offset either by pressing the CLR key, by entering a zero for the amount of the offset, or by pressing OFFSET DELETE in 6L field.
[2L] START WPT	The START WPT ident for the offset is displayed in yellow if a temporary flight plan exists, in blue if already inserted, or in green when the field is not modifiable. The default START WPT shall be the waypoint where the lateral revision is performed, the first waypoint offsettable, or PPOS if the offset is currently flown. This waypoint can also be selected from the list of waypoints in the fields 3L to 5L, or can be manually entered by the flight crew.
[3L] to [5L]	Display the start waypoints available for selection. Two scrolling list are available. The active start waypoint is displayed in green in the list. Other waypoints are displayed in blue. The currently selected start waypoint does not have selection arrow associated.
[6L] RETURN ERASE	RETURN: The flight crew presses this key to return to the last displayed LAT REV page. ERASE: It is displayed when a temporary flight plan has been created, and it enables the flight crew to erase the temporary flight plan.
[1R] INTCPT ANGLE	This field displays the intercept angle. The angle may be between 10 ° and 50 °. The intercept angle in the AMI is the default value, and is shown in blue. When the flight crew enters an intercept angle, or modifies another element in the OFFSET page, the field becomes yellow. One time the temporary flight plan is inserted, the field becomes blue.
[2R] END WPT	The END WPT ident for the offset is displayed in yellow if a temporary flight plan exists, or in blue if already inserted. The default END WPT shall be the waypoint terminating the last consecutive offsettable leg from default or currently selected START WPT. This waypoint can also be selected from the list of waypoints in the fields 3R to 5R, or can be manually entered by the flight crew.

[3R] to [5R]	Display the end waypoints available for selection. Two scrolling lists are available. The active end waypoint is displayed in green in the lists. Other waypoints are displayed in blue. The currently selected end waypoint does not have selection arrow associated.
[6R] INSERT OFFSET DELETE	INSERT: This field allows the flight crew to activate the temporary flight plan and reverts the display to the active flight plan. This field is displayed when the offset segment is completely defined on OFFSET page. OFFSET DELETE: This prompt enables the flight crew to create a temporary flight plan where the predefined offset is canceled. This field is displayed when an offset exists in the active flight plan.

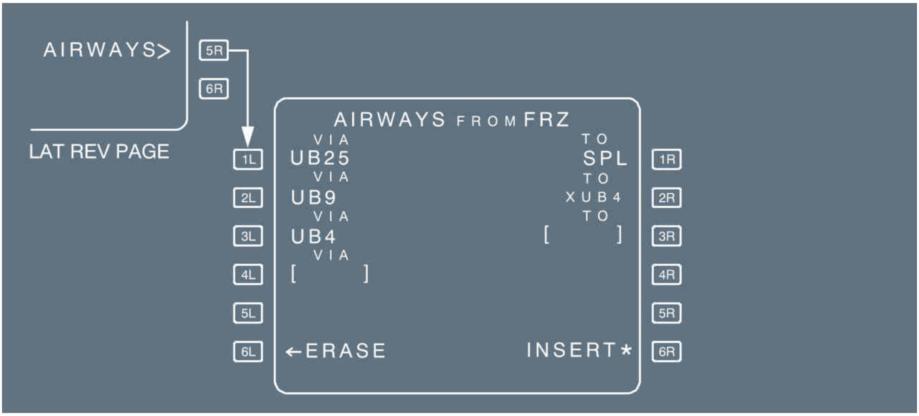
Note: *If the waypoint lists in lines 3 to 5 do not fit in one page, the flight crew can scroll in an open loop, two lines by two lines. To keep the initial order of the list, two markers appear:*

- *- START OF LIST - : This marker is displayed at the beginning of the list*
- *- END OF LIST - : This marker is displayed at the end of the list.*

AIRWAYS PAGE

Ident.: DSC-22_20-50-10-25-00006769.0001001 / 01 OCT 12
Applicable to: LV-GKO, LV-GKP

This page allows the pilot to select up to five airways for stringing into the flight plan after the revise waypoint.
The pilot calls up this page by pressing the lateral revision page [5R] key.



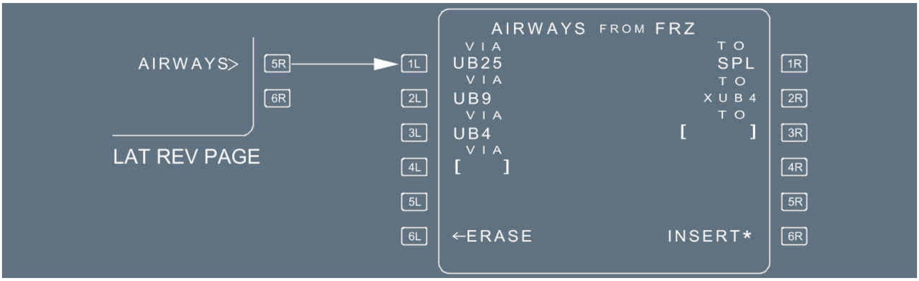
TITLE	Revise point ident (large green font)
[1L] to [5L] VIA	This field displays the airways entered by the pilot.

[6L] ERASE or RETURN	The flight crew presses this key to return to the lateral revision page. This field displays ERASE when a temporary flight plan is created. It allows to erase the temporary flight plan.
[1R] to [5R] TO	Displays the ending points of the corresponding airways entered on the [1L] to [5L] entries. The ending point is displayed in large blue font if manually entered, in blue small font if FMGEC computed.
[6R] INSERT (amber)	Allows to insert the entered VIA/TO segments into the flight plan. The display reverts to the F-PLN page.

AIRWAYS PAGE

Ident.: DSC-22_20-50-10-25-00006769.0003001 / 01 OCT 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

This page allows the pilot to select up to five airways for stringing into the flight plan after the revise waypoint.
The pilot calls up this page by pressing the lateral revision page [5R] key.



TITLE	Revise point ident (large green font)
[1L] to [5L] VIA	This field displays the airways entered by the pilot.
[6L] ERASE or RETURN	The flight crew presses this key to return to the lateral revision page. This field displays ERASE when a temporary flight plan is created. It allows to erase the temporary flight plan.
[1R] to [5R] TO	Displays the ending points of the corresponding airways entered on the [1L] to [5L] entries. The ending point is displayed in large blue font if manually entered, in blue small font if FMGEC computed.
[6R] INSERT (amber)	Allows to insert the entered VIA/TO segments into the flight plan. The display reverts to the F-PLN page.

Note: 1. *If the entered airway contains at least one fixed radius transition waypoint as defined in the navigation database, and the TO waypoint is defined and, the fixed radius transition waypoint is in the flight plan, then, "FIXED TURN RADIUS AWY" is displayed between the VIA and TO fields.*
2. *If the condition for display "FIXED TURN RADIUS AWY" is satisfied for two consecutive airways lines, the second line displays (") instead of the whole message.*

DEPARTURE PAGES

Ident.: DSC-22_20-50-10-25-00006789.0001001 / 16 MAR 11
Applicable to: ALL

These pages allow the pilot to review departure procedures (RWY, SID, TRANS) and enter them into the active flight plan.
The pilot calls them up by pressing the 1L key when the display is showing the lateral revision page for the origin.
Three pages are available : RWY, and SIDs and TRANS (if any).
The pilot calls up each page sequentially either by selecting a data item (such as RWY) or by pressing the [→] key on the MCDU console.

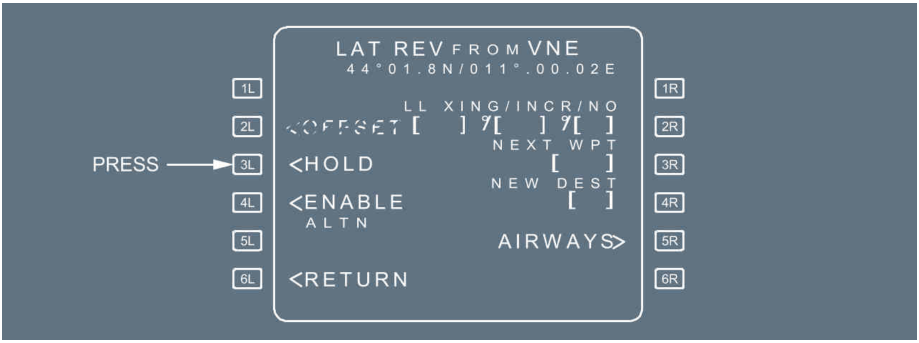
Line 1 RWY, SID TRANS	This line displays the RWY, SID, and TRANS in green after they have been inserted into the active flight plan or in yellow if selected but not yet inserted. If nothing has been selected or inserted, the line displays dashes.

[2L] to [5L] RWY's/SID's	These fields display selectable and selected RWYs or SIDs (including EOSID and NO SID option). The pilot can slew each list. Selectable RWYs and SIDs are displayed in blue with an arrow. Once a RWY or SID is selected, the arrow disappears. A RWY or SID already inserted in the flight plan is displayed in green. The display shows the length, heading (T if true North referenced), and, if available, the ILS ident and frequency for each runway.
[6L] ERASE or RETURN	The pilot presses this key to erase a selected data item and revert to the previous selection. If the pilot erases the page, the display reverts to the active flight plan page. The display shows RETURN instead of ERASE when the pilot has not created a temporary flight plan.
[2R] to [5R] TRANS	This field displays the selectable and selected en route transitions respectively in blue and green. They are blank if there are no transitions.
[6R] INSERT or BLANK	The pilot uses this key to insert a temporary procedure into the flight plan. The page reverts to the active flight plan page when the insertion is completed. It is associated with RETURN (6L).
[6M] EOSID	Once a runway is inserted into the flight plan, this field displays any ENG OUT SID for that runway. If there is none, it displays NONE.

HOLD PAGES

Ident.: DSC-22_20-50-10-25-00006800.0001001 / 01 OCT 12
Applicable to: ALL

These pages allow the pilot to review and modify the holding pattern parameters at the selected revise waypoint. The holding pattern data may come from the database or may be defaulted to standard dimensions.
The pilot calls up these pages by pressing the HOLD key on the LAT REV page for the waypoint.
Three different HOLD pages are available :



LAT REV FROM VNE

             UTC   FUEL
             ----  ---.-
←ERASE              INSERT*
```

[1L] INB CRS	This field displays the inbound course of the holding pattern. The data may be modified.
[2L] TURN	This field shows the direction to turn in the hold (L or R). The data may be modified.
[3L] TIME/DIST	This field shows the time and distance for the outbound leg. The data may be modified. Time and distance are dependent values that the system calculates from the predicted ground speed, which in turn depends upon the holding speed (speed for maximum endurance, ICAO speed limit, or constraint speed, whichever is lower).
[6L] ERASE or RETURN	The pilot presses this key when the field shows ERASE to erase the holding pattern. The pilot presses this key when the field shows RETURN to return to the LAT REV page if the hold is already inserted in the flight plan.

[2R] REVERT TO DATABASE or REVERT TO COMPUTED	The pilot presses this key to delete manual modifications to the database hold (or computed hold) and revert to database (or computed) holding data.
[6R] INSERT	The pilot presses this key to insert the hold into the active flight plan.
LAST EXIT UTC FUEL	This field displays the time at which the aircraft must leave the holding pattern in order to meet fuel policy criteria (extra fuel = 0). The system also displays the estimated fuel on board at that time.

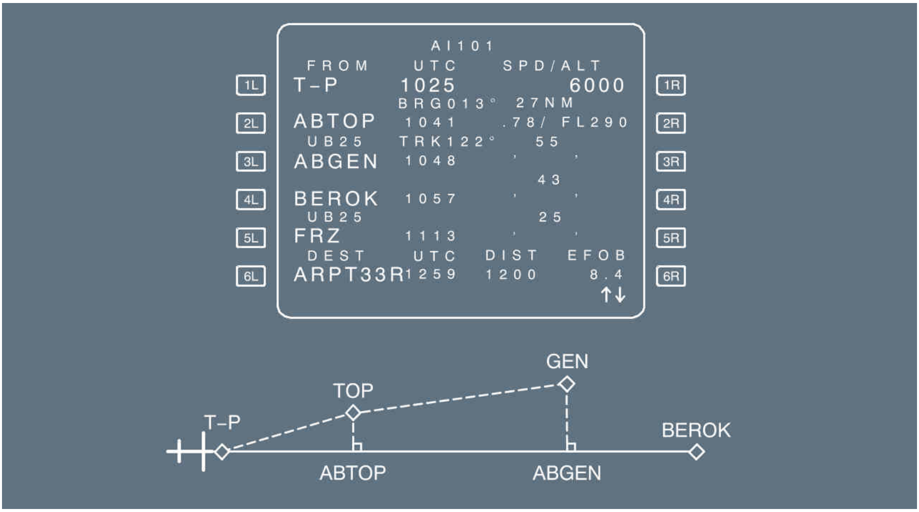
F-PLN A PAGE (DIR TO/ABEAM WPTS)

Pressing the “DIR” key under the MCDU screen brings up the DIR TO page. The [1L] key on this page is the DIR TO key. The pilot presses it to modify the flight plan by creating a direct leg from the aircraft’s present position to any selected waypoint. When in NAV mode, the pilot must use this key to modify the active leg or the TO waypoint. The pilot cannot call up this page when the aircraft’s present position is not valid.

[1L] DIR TO	Pressing this key selects the DIRECT TO or INTERCEPT waypoint. The pilot can identify the waypoint to be inserted by using its identifier, its latitude and longitude, place/bearing/distance, or place-bearing/place-bearing. *Note: If the entered DIR TO is a latitude/longitude, the NEW WAYPOINT page is automatically called up.* If the pilot does not select the RADIAL IN (1R) or RADIAL OUT (2R) or ABEAM PTS (2L), the DIR TO function routes the aircraft from the present position to the waypoint inserted in the DIR TO field.
Line 3 to Line 6	These lines display the active flight plan with time/speed/distance predictions. The display may be slewed ↑↓. Pressing any key activates the DIRECT TO function from present position to the waypoint adjacent to that key.
[2L] ABEAM PTS	The flight crew presses this key to activate the DIR TO/ABEAM function which projects perpendiculary the flight plan waypoints on the DIR TO leg :



```
                AI101

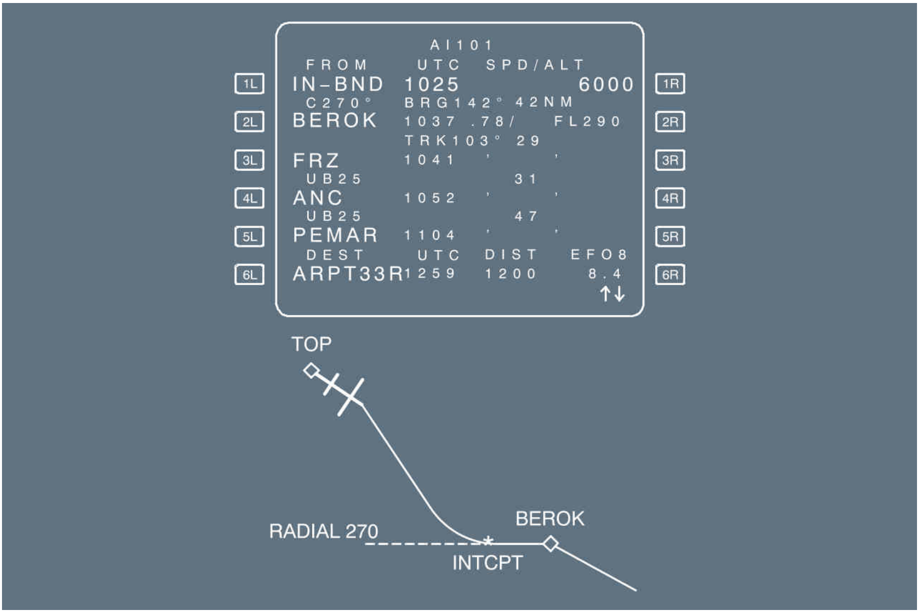
```

[1R] RADIAL IN and [2R] RADIAL OUT	The pilot fills these fields to define a QDM or a QDR associated to the waypoint defined in 1L. These keys activate respectively the DIRTO/INTERCEPT TO and DIRTO/INTERCEPT FROM functions. The pilot enters the radial in or radial out as : XXX T or XXX M, XXX being the radial, and T or M depending on the reference (true or magnetic). If T or M is not precised, the reference selected on the TRUE/MAG switch is used. The aircraft intercepts from its current position and track the selected waypoint and QDM (or QDR) to (or from) this waypoint.



```

If the DIR TO/INTCPT WPT entry is to a waypoint already in the flight plan, a defaulted RADIAL IN is displayed in small font. However no radial is displayed on ND for this default radial. No default radial is provided for the RADIAL OUT field.

Selecting the INTCPT TO (RADIAL IN [1R]) function:
- activates the intercept radial INTO the WPT
- sets the course = radial IN + 180 °
- reverts the display to F-PLN A page.

Selecting the INTCPT TO (RADIAL IN [2R]) function :

- activates the of the intercept radial FROM the WPT
- sets the course = radial OUT
- reverts the display to F-PLN A page.

For detail (*Refer to DSC/22_20 Auto Flight - Flight Management / 30 Flight Planning / 10 Lateral Fonctions / Direct-TO-Fonction*)

Note: *It is not recommended to use the DIR TO function when the aircraft is on the ground. The use of the DIR TO function when the aircraft is on the ground may result in the loss of all the departure data, that includes both of the following:*

- *The takeoff speeds*
- *The derated level, or the flexible temperature.*

ARRIVAL PAGES

Ident.: DSC-22_20-50-10-25-00006818.0001001 / 14 MAY 12
Applicable to: LV-GKO, LV-GKP

These pages allow the pilot to review arrival procedures (approaches, VIAs, STARs, TRANS) and insert them into the active flight plan.
The pilot calls them up from the LAT REV page for the destination by pressing 1R key.
Three pages, APPR, STAR, and VIA, are available, along with a fourth, TRANS, if there are any transitions.
The pilot calls up each page sequentially either by selecting a data item (such as APPR) or by pressing the [→] key on the MCDU console.

Line [1L] - [1R] [2R]	This line displays the APPR, VIA, STAR, and TRANS in green if they have been inserted in the flight plan, and in yellow, as temporary flight plan, if they have been selected but not yet inserted. It displays dashes or NONE if nothing has been selected or inserted.
[2L] APPR VIAS	The pilot presses this key to call up transitions from the last point of the STAR to first point of the approach.

[3L] to [5L]	These fields list selectable and selected APPRs, STARs, and VIAs. The flight crew can slew the pages, when necessary. Selectable APPRs, STARs, and VIAs are displayed in blue with an arrow. Once the pilot has selected an APPR, STAR, or VIA, the arrow disappears. After the APPR, STAR, or VIA is inserted into the flight plan, it is displayed in green. For each approach the display shows runway length, heading (T if true North referenced), and the frequency and identifier of the ILS when ILS is available.
[6L] ERASE or RETURN	The pilot presses this key to erase selected data and revert to the previous selection. The page reverts to the LAT REV page. The field displays “RETURN” instead of ERASE when the flight crew has not created a temporary flight plan.
[3R] to [5R] TRANS	These fields display selectable and selected en route transitions (if any). They are blue when selected, and become green when inserted into the active flight plan.
[6R] INSERT	The pilot presses this key to insert the temporary procedure into the active flight plan. The page reverts to the active flight plan page when this happens.

ARRIVAL PAGES

Ident.: DSC-22_20-50-10-25-00006818.0003001 / 12 FEB 13
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

These pages allow the pilot to review arrival procedures (approaches, VIAs, STARs, TRANS) and insert them into the active flight plan.
The pilot calls them up from the LAT REV page for the destination by pressing 1R key.

Three pages, APPR, STAR, and VIA, are available, along with a fourth, TRANS, if there are any transitions.
The pilot calls up each page sequentially either by selecting a data item (such as APPR) or by pressing the [→] key on the MCDU console.

Line [1L] - [1R] [2R]	This line displays the APPR, VIA, STAR, and TRANS in green if they have been inserted in the flight plan, and in yellow, as temporary flight plan, if they have been selected but not yet inserted. It displays dashes or NONE if nothing has been selected or inserted.
[2L] APPR VIAS	The pilot presses this key to call up transitions from the last point of the STAR to first point of the approach.
[3L] to [5L]	These fields list selectable and selected APPRs, STARs, and VIAs. The flight crew can slew the pages, when necessary. Selectable APPRs, STARs, and VIAs are displayed in blue with an arrow. Once the pilot has selected an APPR, STAR, or VIA, the arrow disappears. After the APPR, STAR, or VIA is inserted into the flight plan, it is displayed in green. For each approach the display shows runway length, heading (T if true North referenced), and the frequency and identifier of the ILS or the channel and identifier of the GLS ◁* when ILS or GLS ◁* is available. In case there are multiple approaches for the same runway, the approach is identified with the runway plus the multiple indicator (i.e. ILS 33L-S).
[6L] ERASE or RETURN	The pilot presses this key to erase selected data and revert to the previous selection. The page reverts to the LAT REV page. The field displays “RETURN” instead of ERASE when the flight crew has not created a temporary flight plan.
[3R] to [5R] TRANS	These fields display selectable and selected en route transitions (if any). They are blue when selected, and become green when inserted into the active flight plan.
[6R] INSERT	The pilot presses this key to insert the temporary procedure into the active flight plan. The page reverts to the active flight plan page when this happens.

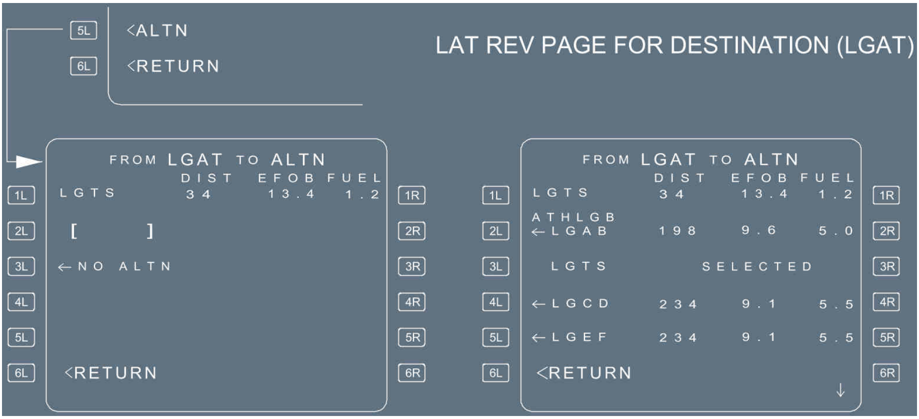
ALTERNATE PAGE

Ident.: DSC-22_20-50-10-25-00006841.0003001 / 09 DEC 15
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

This page enables the pilot to review, in the NAV database, the alternate airports that are paired with the destination, and define additional alternates, if needed. (Alternate airports are linked to the destination). The pilot calls up this page with the ALTN prompt, from the lateral revision page for the destination.



```
      FROM LGAT TO ALTN
                DIST   EFOB FUEL
LGTS             34    13.4  1.2

```

TITLE	The destination airport is displayed in large green font.
[1L] ALTN	This field displays the selected alternate, and its associated data: In green, if it is active ; in yellow, if it is temporary. “NONE” is displayed, if NO ALTN option is selected, or if the destination has no alternate.
Line 2 to line 5	These lines display the identifications of alternates (up to 6), the great-circle distances between the alternates and the destination (not modifiable by the flight crew), the estimated fuel on-board remaining after landing at the alternates and the fuel weight required to reach the alternates (modifiable by the flight crew). If the database contains a company route between the destination and the alternate, the distance shown is an airway distance (not a great-circle distance). When the database defines a preferred alternate, it is displayed on Line 2 (if no scrolling has been performed).
Line 2 to line 5 OTHER ALTN	The pilot can enter up to 3 airport identifiers in the brackets. If that airport is not stored in the database, the NEW RUNWAY page appears for the pilot to use in defining it. If it is stored in the database, the ROUTE SELECTION page appears, and the pilot can use it to select the best route. When the flight crew defines an OTHER ALTN from a company route, the FMS does not compute the associated distance value as long as the flight crew does not insert this OTHER ALTN.

Line 2 to line 5 NO ALTN	The pilot uses this key to select the NO ALTN option.
[6L] RETURN or ERASE	The pilot presses this key to make the display revert to the LAT REV page. Pressing this key erases the temporary selection.
[6R] INSERT	Pressing this key activates the temporary selection.

ALTERNATE PAGE

Ident.: DSC-22_20-50-10-25-00006841.0001001 / 03 NOV 21
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

This page enables the flight crew to review, in the NAV database, the alternate airports that are paired with the destination, and define additional alternates, if needed. (Alternate airports are linked to the destination). The flight crew calls up this page with the ALTN prompt, from the lateral revision page for the destination.

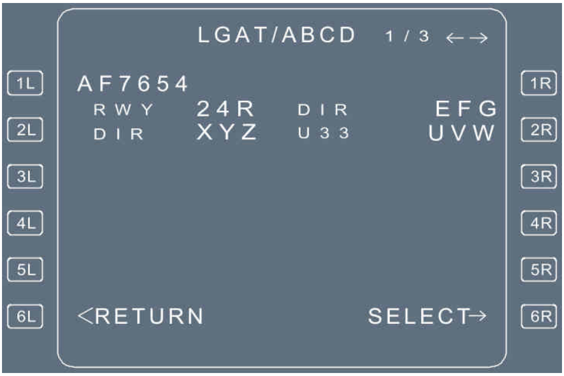
TITLE	The destination airport is displayed in large green font.
[1L] ALTN	This field displays the selected alternate : In green, if it is active ; in yellow, if it is temporary. “NONE” is displayed, if NO ALTN option is selected, or if the destination has no alternate.

Line 2 to line 5	These lines display the identifications of alternates (up to 6), the extra fuel weight remaining after landing at the alternates, and the great-circle track and distances to them from the destination. If the database contains a company route between the destination and the alternate, the distance shown is an airway distance (not a great-circle distance). When the database defines a preferred alternate, it is displayed on Line 2 (if no scrolling has been performed).
[4L] OTHER ALTN	The flight crew can enter an airport identifier in the brackets (Line 3). If that airport is not stored in the database, the NEW RUNWAY page appears for the flight crew to use in defining it. If it is stored in the database, the ROUTE SELECTION page appears, and the flight crew can use it to select the best route. The flight crew may enter a distance in the DIST field of the OTHER ALTN prompt in order to get preliminary fuel predictions. However, once the flight crew has selected the alternate airfield as a temporary alternate and then inserted it, the ALTN distance reverts either to the airway distance if the flight crew has selected a company route, or otherwise to the direct distance to the alternate. The flight crew can use OTHER ALTN to overwrite and replace the previous OTHER ALTN.
NO ALTN	The flight crew uses this key to select the NO ALTN option.
[6L] RETURN or ERASE	The flight crew presses this key to make the display revert to the LAT REV page. Pressing this key erases the temporary selection.
[1R] CO RTE	The flight crew presses this key to display the active company route between the destination and the selected alternate.
[6R] INSERT	Pressing this key activates the temporary selection.

ROUTE SELECTION PAGE FOR ALTERNATE

Ident.: DSC-22_20-50-10-25-00006842.0001001 / 10 DEC 09
Applicable to: ALL

This page allows the pilot to review the company route between the destination and the alternate, and select a different route, if that seems appropriate.
This page comes up automatically when the flight crew enters an ident in the OTHER ALTN field.
See “Route Selection”, page for a description of this page.



```
         LGAT/ABCD   1/3 ←→
AF7654
 RWY    24R   DIR      EFG
 DIR    XYZ   U33      UVW

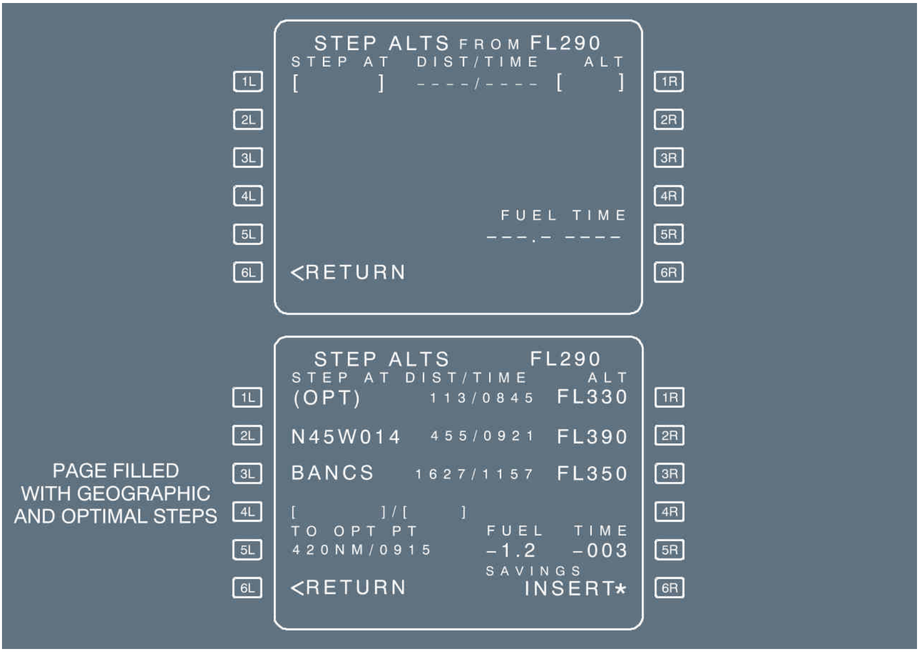
<RETURN             SELECT→
```

[6R] SELECT	When the pilot presses this key the display reverts to the alternate page. (The distance between the destination and the alternate is then the airway distance).

STEP ALTS PAGE

Ident.: DSC-22_20-50-10-25-00006848.0001001 / 26 OCT 12
Applicable to: LV-GKO, LV-GKP

This page enables the flight crew to insert up to four geographic step points and one optimal step point into the flight plan. This page also displays the cost savings associated with the optional step. The flight crew either calls it up from the vertical revision page, or from the performance cruise page.



```
 STEP ALTS FROM FL290

                SAVINGS
<RETURN          INSERT*
```

TITLE	STEP ALTS, followed by the current cruise altitude.
Line 1	In this field, the flight crew can either enter a geographic step, or an altitude for an optimal step. *Note: The two formats for a geographic step are:* *- Point/altitude or point/FL* *- Point/distance/altitude or point/distance/FL.*
Line 2 to line 4	STEP AT (large blue font). The flight crew can only enter geographic steps in these fields. Displays the point at which the active step begins. It may be either an active (or secondary) flight plan waypoint, or an inserted optimal point (OPT). *Note: The two formats for a geographic step are:* *- Point/altitude or point/FL* *- Point/distance/altitude or point/distance/FL.*

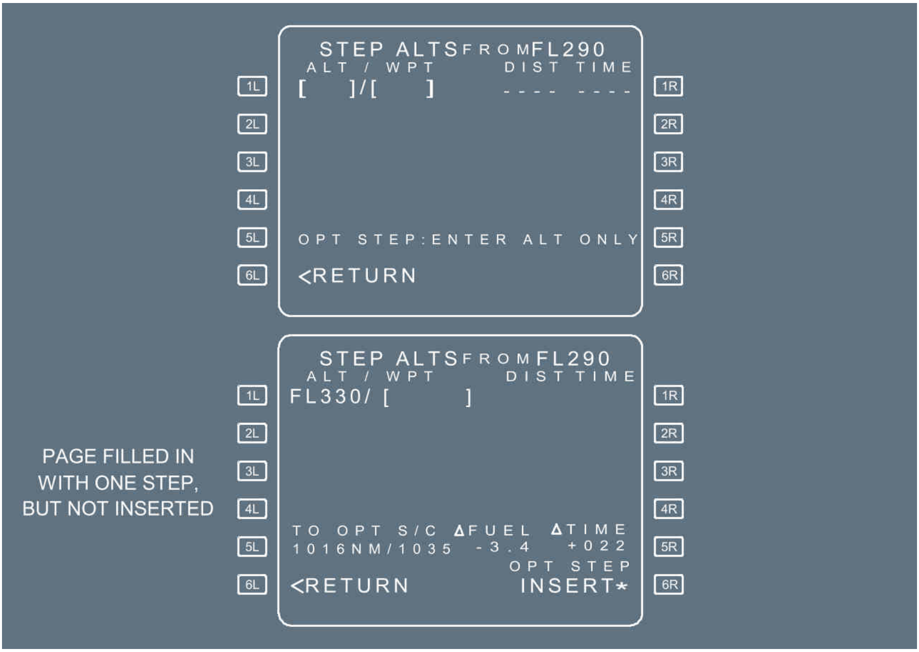
DIST / TIME (UTC) (green small font) :	Displays the distance to go and time from the present aircraft position along the flight plan to the step point.
ALT	Displays the altitude to step to, and allows entry of the optimal step format : FL or ALT. *Note:* *The following messages may be displayed in the DIST / TIME field :* - *ABOVE MAX, if the step altitude exceeds the Max altitude computed by the FMS (Refer to DSC-22_20-10 General).* - *IGNORED, if the step end point is less than 50 NM from the top of descent.* - *STEP NOW, if the aircraft is within 20 NM from the step point.* - *NO OPTIMAL, if an inserted optimal step falls in a discontinuity due to a flight plan change, or if a time constraint exists in the flight plan.*
[5L] TO OPT PT (green small font)	This field displays the distance and time to a non inserted optimal step point if one exists.
[6L] RETURN	The flight crew presses this key to return the display to the previous page. *Note:* *On any flight plan change, an inserted optimal step remains in the flight plan at a fixed distance to destination.*

[5R] SAVINGS	This field displays the fuel and time savings before insertion of the optimal step point. Fuel savings are displayed in thousand of kilograms (or pounds) (maxi 99.9). The value is preceded by : "–" in case of fuel saving, "+" in case of additional fuel cost. Time savings are displayed in hours and minutes. The value is preceded by "–" in case of time saving, "+" in case of additional time cost. _Note:_ *If no optimal step point exists for the altitude displayed in [1R], the "NO OPTIMAL" message is displayed in the FUEL / TIME field. This message is also displayed if the optimal step falls into a discontinuity.*
[6R] INSERT (amber)	This field displays INSERT when an optimal step point exists but is not yet inserted. When INSERT is selected : - the optimal step point is inserted into the flight plan. - OPT is displayed in line 1L. - optimal step distance and time are deleted in line 5L. - the * UPDATE blue prompt replaces the INSERT prompt.
UPDATE	This prompt allows to compute another optimal step point. The UPDATE prompt is then replaced by the *INSERT prompt.

STEP ALTS PAGE

Ident.: DSC-22_20-50-10-25-00006848.0003001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

This page enables the flight crew to insert up to four geographic step points and one optimal step point into the flight plan. This page also displays the time/fuel savings associated with the optimal step.
The flight crew calls the STEP ALTS page up either from the vertical revision page, or from the PERF Cruise page when the FMS flight phase is Cruise.



```
    STEP ALTS FROM FL290

1016NM/1035  -3.4   +022
                 OPT STEP
<RETURN          INSERT*
```

PAGE FILLED IN WITH ONE STEP, BUT NOT INSERTED

TITLE [1L] – [1R] [4L] – [4R]	STEP ALTS followed by the current cruise altitude.
ALT/WPT (blue)	The waypoint identifier, as well as the altitude to step, can be entered in this field. Both are displayed in large font. The waypoint may either be an active (or secondary) flight plan waypoint, or an inserted optimal point (OPT). When an entry is made, a temporary F-PLN is created.

DIST/TIME (UTC) (small green font)	Displays the distance to go, and time from the present aircraft position along the flight plan to the step point. *Note: The following messages may be displayed in the DIST/TIME field:* - *"ABOVE MAX", if the step altitude exceeds the MAX altitude.* - *"IGNORED", if the end step point is less than 50 NM from the top of descent or if the step climb is located prior to the top of climb or after the top of descent.* - *"STEP AHEAD", when the aircraft is within 20 NM of the start step point.* - *"NO OPTIMAL", if a non inserted optimal step falls in a discontinuity due to a flight plan change, or when no new optimal exist after an UPDATE or when no optimal step point exists for the entered altitude.* *Note: If no optimal step point exists for the altitude displayed in [1L], the "NO OPTIMAL" message is displayed in the FUEL/TIME field. This message is also displayed if the optimal step falls into a discontinuity.*
[5L] OPT STEP : ENTER ONLY ALT (white) TO OPT S/C (green small front)	This fields displays the distance and time to an uninserted optimal step point, if one exists. It is displayed to guide the flight crew for the entry format of an optimal step. *Note: On any flight plan change, an inserted optimal step remains in the flight plan at a fixed distance to destination.*
[6L] RETURN	The flight crew presses this key to return to the previous page.
[5R] SAVINGS	This field displays the fuel and time savings prior to the insertion of the optimal step point. Fuel savings are displayed in thousands of kilograms (or pounds) (maxi 99.9). The value is preceded by: "-" in case of fuel saving, "+" in case of additional fuel cost. Time savings are displayed in hours and minutes. The value is preceded by: "-" in case of time saving, "+" in case of additional time cost.

[6R] INSERT* (amber)	This field displays INSERT*, when an optimal step point exists but is not yet inserted. When INSERT is selected: - The optimal step point is inserted into the flight plan. - OPT is displayed in line 1L. - Optimal step distance and time are deleted in line 5L. - The UPDATE* blue prompt replaces the INSERT* prompt.
UPDATE*	This prompt enables the computation of another optimal step point. The UPDATE* prompt is then replaced by the INSERT* prompt.

VERTICAL REVISION PAGES

Ident.: DSC-22_20-50-10-25-00006845.0001001 / 21 NOV 11
Applicable to: ALL

These pages contain the menu of available vertical flight plan revisions that can be applied at a selected waypoint.
The pilot calls up these pages from the flight plan A or B pages by pressing the right hand key next to the selected revised waypoint.
The pilot may make several different vertical revisions (although some may not be available at all waypoints): speed limit, speed constraint, altitude constraint, time constraint, wind page and STEP ALTS page.

VERT REV WITH CONSTANT MACH SEGMENT
DEFINED BETWEEN N47E005 AND N47W009
(BOTH WAYPOINTS ARE IN CRZ PHASE)

TITLE (white)	“VERT REV AT [location]” (Second line shows remaining fuel and extra fuel at the revise waypoint.

[1L] "TOO STEEP PATH BEYOND" (amber)	This message is displayed if the waypoint is part of a leg with too steep a descent path.
[2L] CLB/DES SPD LIM (magenta)	This field displays the speed limit applicable to the climb or descent phase. It displays it in a large font when data has been inserted manually and in a small font when data comes from the database.
[3L] SPD CSTR (magenta)	This field displays any speed constraint assigned to the revised waypoint. It is in a large font when inserted manually, and in a small font when it comes from the database. It is not displayed at the origin airport, a FROM waypoint, a speed limit pseudo waypoint, or the destination airport.
[4L] QNH	This field functions only when the revised waypoint is the primary destination. It allows the pilot to enter the sea-level atmospheric pressure. This field is identical to the QNH field of the PERF APPR page.
[4L] MACH/START WPT (blue)	This prompt allows the pilot to enter or modify the start point of a constant Mach segment, and its associated Mach. This prompt is not displayed at primary destination and alternate flight plan waypoints. (*Refer to DSC-22_20-30-20-05 General*)
[5L] WIND (blue)	The pilot presses this key to access to the wind pages. The first wind page that is displayed, corresponds to the selected waypoint e.g. climb page if the selected waypoint is a climb phase waypoint. A CLR action reverts it to brackets.
[6L] RETURN or CLB	The pilot presses this key to return to the last displayed flight plan page. When displayed pressing this key assigns the constraint to CLB phase and inserts it into the vertical flight plan. The page reverts to the flight plan page.
[2R] RTA prompt	This prompt gives access to the RTA page. It is not displayed when the VERT REV page is accessed from the alternate F-PLN.

[3R] ALT CSTR (magenta)	This field displays the altitude constraint assigned to this revised waypoint. It uses a large font when the constraint is entered manually, a small font when it is from the database. A CLR action reverts it to brackets. The constraint may be : • “At”, entered as XXXXX (FL 180, for example) • “At or above”, entered as + XXXXX or XXXXX + (+ FL 310, for example) • “At or below”, entered as – XXXXX or XXXXX – (– 5000, for example) • A “window” constraint. The altitude window consists of two altitudes between which the aircraft should fly. The crew cannot manually enter a “window” constraint.
G/S INTCP (green)	This field displays the glide intercept altitude for an ILS approach on the vertical revision page at destination.
[4R] ALT ERROR (green)	When the aircraft misses a predicted altitude constraint, this field displays the difference between the altitude constraint and the predicted altitude. If, for example, “– 500” appears in this field in green, the aircraft will reach the waypoint at an altitude 500 ft below the constraint altitude. This applies only to waypoints in the climb and descent phases.
[4R] END WPT (blue)	This prompt allows the pilot to enter or modify the endpoint of a constant Mach segment. It is displayed when a pair Mach/start exists in 4L field. This prompt is not displayed on the destination VERT REV page. (*Refer to DSC-22_20-30-20-05 General*).
[5R] STEP ALTS (white)	This legend appears for any waypoint once a cruise altitude has been entered. It is not available in engine-out, descent, approach and go-around phases. This gives the pilot access to the step altitudes page.

[6R] DES	When this field displays “DES”, pressing this key assigns the constraints to the descent phase and inserts them into the vertical flight plan. The page reverts to the F-PLN page. (See Note, below).

Note: *Altitude and speed constraints may apply to climb, descent or approach phase, but never to cruise phase. Fields 6L/6R display “CLB/DES” when the revised waypoint is a cruise phase waypoint and the FMGES needs to know if the new constraint is to be applied in climb or descent phase. The FMGES will modify the cruise phase accordingly. These 2 prompts also display “CLB/DES” when the predictions are not computed. (top of climb and top of descent not yet defined).*

DATA INDEX PAGES

Applicable to: ALL

Ident.: DSC-22_20-50-10-25-D-00006852.0001001 / 14 MAY 12

GENERAL

There are two INDEX pages:
- The DATA INDEX 1/2 page gives access to various pages devoted to navigation.
- The DATA INDEX 2/2 page lists the navigation data entered in the FMGES.

The pilot enters those items labeled “stored” and can modify them. The pilot can call up the others, but cannot modify them.
The pilot calls up these pages by pressing the DATA key on the MCDU console:

DATA INDEX 1/2 PAGE

[1L] POSITION MONITOR - [2L] IRS MONITOR	When the flight crew presses these keys, the display shows all essential navigation data.
[3L] GPS MONITOR ◁*	This key calls up the GPS MONITOR page.
[4L] A/C STATUS	This key calls up the aircraft status page.
[5L] CLOSEST AIRPORTS.	This key calls up the closest airports page.
[6L] EQUITIME POINT	This key calls up the equitime point page.
[6R] ACARS/PRINT ◁*	This key calls up the PRINT function pages and the ACARS function pages.

Ident.: DSC-22_20-50-10-25-D-00006866.0001001 / 10 DEC 09

DATA INDEX 2/2 PAGE

[1L] WAYPOINTS - [2L] NAVAIDS - [3L] RUNWAYS - [4L] ROUTES	These keys call up descriptions of waypoints, navaids, runways, and routes stored in the database so that the pilot can review it.
[1R] STORED WAYPOINTS - [2R] STORED NAVAIDS - [3R] STORED RUNWAYS - [4R] STORED ROUTES	These keys call up waypoints, navaids, runways, and routes that the pilot has stored, allowing the pilot to review them and to store them in or delete them from the database. They are erased automatically in the done phase when a specific pin program is activated.

WAYPOINT PAGE

- The pilot can call up this page by pressing the 1L key when the data index page is on display. The display then shows waypoint information associated with the identifier the flight crew inserts in the [1L] field.
- It is possible to call up by this page any waypoint not stored in the stored waypoint list if they belong to the active, temporary or secondary flight plan.

Ident.: DSC-22_20-50-10-25-E-00006891.0003001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

STORED WAYPOINT PAGE

The flight crew calls up this page by pressing the [1R] when the DATA INDEX page is on display. This page displays waypoints that the flight crew has defined and stored. It lists each stored waypoint along with a number that shows the relative order in which it was inserted in the database. This number is displayed in the upper right corner of the page. For example, 1/99 indicates that the waypoint was the first of 99 stored.

Note: *LAT/LONG crossing points and Abeam/Radial Intercept points are never included in the stored waypoint list.*

[1L] IDENT	To delete a waypoint, the flight crew clears the [1L] IDENT display.
[3L]	PLACE/BEARING/DISTANCE.
[4L]	PLACE-BEARING/PLACE-BEARING.
[5R] NEW WAYPOINT	The flight crew presses this key to call up the NEW WAYPOINT page.
[6R] DELETE ALL	The flight crew presses this key and the label changes to CONFIRM DELETE ALL. Pressing a second time this key deletes all the waypoints stored by the flight crew except those currently in use in the active or secondary flight plan (F-PLN ELEMENT RETAINED appears on the MCDU).

Ident.: DSC-22_20-50-10-25-E-00006891.0001001 / 18 MAR 11
Applicable to: LV-GKO, LV-GKP

STORED WAYPOINT PAGE

The pilot calls up this page by pressing the 1R key when the data index page is on display. This page displays waypoints that the pilot has defined and stored. It lists each stored waypoint along with a number that shows the relative order in which it was inserted in the database. This number is displayed in the upper righthand corner of the page. For example, “1/20” indicates that the waypoint was the first of 20 stored.

Note: *Lat/long crossing points and Abeam/Radial Intercept points are never included in the stored waypoint list.*

[1L] IDENT	To delete a waypoint, the pilot clears the 1L ident display.
[3L]	PLACE/BEARING/DISTANCE and
[4L]	PLACE-BEARING/PLACE-BEARING
[5R] NEW WAYPOINT	The pilot presses this key to call up the NEW WAYPOINT page.
[6R] DELETE ALL	The pilot presses this key and the label changes to amber CONFIRM DELETE ALL. Pressing a second time this key deletes all the waypoints stored by the flight crew except those currently in use in the active or secondary flight plan. ("F-PLN ELEMENT RETAINED" appears on the MCDU).

Ident.: DSC-22_20-50-10-25-E-00006942.0003001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

NEW WAYPOINT PAGE

- The flight crew calls up this page by pressing the [5R] when the STORED WAYPOINT page is on display.
- The flight crew can use this page to define and store up to 99 waypoints. Entering an additional waypoint deletes the first one.
  The flight crew defines a waypoint by entering its IDENT in the data field next to [1L], then entering its position in the amber boxes.
  A "T" may be added if the bearing has been defined using the true North reference e.g. N42E002/015 °T/120.0 or WPT 01. 030 °T/WPT02-125 °T.
  The STORE prompt appears next to [6R] when the boxes are filled, and the flight crew presses the key to store the waypoint in the database.
  If the flight crew enters the waypoint's position as place/bearing/distance or place-bearing/place-bearing, the FMGEC computes its latitude and longitude.

Ident.: DSC-22_20-50-10-25-E-00006942.0001001 / 18 MAR 11
Applicable to: LV-GKO, LV-GKP

NEW WAYPOINT PAGE

- The pilot calls up this page by pressing the 5R key when the STORED WAYPOINT page is on display.
- The pilot can use this page to define and store up to 20 waypoints. Entering an additional waypoint deletes the first one.
  The pilot defines a waypoint by entering its ident in the data field next to 1L, then entering its position in the amber boxes.
  A “T” may be added if the bearing has been defined using the true North reference e.g. N42E002/015 °T/120.0 or WPT 01. 030 °T/WPT02-125 °T.
  The STORE prompt appears next to 6R when the boxes are filled, and the pilot presses the key to store the waypoint in the database.
  If the pilot enters the waypoint’s position as place/bearing/distance or place-bearing/place-bearing, the FMGEC computes its latitude and longitude.

FIG OF MERIT
2 (130NM)

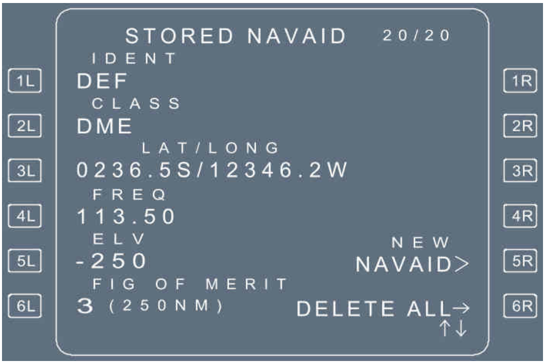
[2L] CLASS	This field identifies the navaid as VOR, DME, VOR DME, VORTAC, NDB, LOC, ILS, GLS ⊲ , ILS/DME, ILS/TAC or TACAN. The field displays NON COLLOCATED if the navaid is non collocated.
[3L] LAT/LONG	If an uncollocated VOR DME or VORTAC is displayed, the LAT/LONG is the VOR latitude and longitude. The LAT/LONG displayed for an ILS, ILS/DME, ILS/TAC is the LAT/LONG of the localizer.
[4L] FREQ or CHAN	CHAN is displayed if the class of the navaid is an MLS or a GLS ⊲ .
[5L] ELV	This field gives the elevation of the navaid in feet above sea level. It is not displayed for VOR or NDB.

[6L] FIG OF MERIT	This field shows how far out the FMGES can autotune a VOR, VOR/DME, VORTAC or DME for display or for computing position. 0 : up to 40 NM 1 : up to 70 NM 2 : up to 130 NM 3 : up to 250 NM
[1R] STATION DEC or RWY IDENT	This is the magnetic declination in the navaid area (used only for VOR, VOR/DME, and VORTAC). The field displays RWY IDENT if the navaid is a LOC, ILS, GLS ◁ , ILS/DME or ILS/TAC.
[2R] CATEGORY	This field shows the navaid's category if it is an ILS, ILS/DME, GLS ◁ or ILS/TAC. A LOC DME has a category = 0.
[3R] COURSE	This is the localizer course if the navaid is an LOC, ILS, GLS ◁ , ILS/DME or ILS/TAC. A "T" is added if the course is true referenced.
[6R] RETURN	This prompt is displayed if the page has been accessed from the SELECTED NAVAID page. The pilot presses this key to return to the SELECTED NAVAID page.

Ident.: DSC-22_20-50-10-25-F-00006935.0001001 / 03 NOV 21

STORED NAVAID PAGE

The flight crew calls up this page by pressing the 2R key on the data index page. The flight crew uses this page to display or delete navaids that has defined and stored.



```
        STORED NAVAID      20/20
   IDENT

STORE→

The pilot can use it to define and store up to 20 navaids. He must enter the navaid elements in two steps :

1. Enter the data in the lines of amber boxes.
2. Enter frequency, elevation, figure of merit, and station declination or ILS category and course, if applicable.

Note: *The pilot cannot create an ILS/DME or a non-colocated navaid. If the runway associated with the ILS or GLS has been entered through the new runway page, the course, ident, and runway ident are already displayed on the new navaid page when it comes up (copied from the new runway page). (Refer to DSC-22_20-50-10-25 RUNWAYS/STORED RUNWAYS/NEW RUNWAY Pages - NEW RUNWAY Page, for details).*

[1R] STATION DEC	The pilot must enter the magnetic declination if the prompt is displayed. This prompt is displayed only for VOR, VORTAC or VOR/DME. For a true referenced station, (polar area), enter OT or TO.
[3R] COURSE	If the navaid is an ILS, GLS , LOC, enter the course. Add a “T” for true reference e.g. 120 °T.
[6R] STORE	This prompt appears when all the amber boxes are filled. The pilot presses the key to store the navaid.

A stored navaid is never used for position computation.

RUNWAY PAGE

This page displays the following information :

[1L] IDENT	The runway ident, which comprises the airport identification and the runway direction. It uses six or seven digits (CYYZ 24L and LFRJ 08, for example).
[2L] LAT/LONG	The latitude and longitude of the runway threshold.
[4L] LENGTH	The runway length in meters (M) or feet (ft), in four digits (9 999 ft).
[5L] ELV	The elevation of the threshold in feet above sea level.
[6L] CRS	The runway course (degrees magnetic). T is displayed, if true North referenced.
[1R] LS IDENT	The LOC, ILS or GLS identifier.

Ident.: DSC-22_20-50-10-25-G-00006940.0001001 / 17 MAR 11

STORED RUNWAY PAGE

The pilot uses this page to display or delete runways defined and stored by the flight crew. The stored runways are listed and numbered in the order in which they were inserted. The number is displayed in the upper righthand corner of the page. (For example, 2/4 means the runway is the second of four stored runways).
The pilot can delete any stored runway from the database by displaying its ident in the 1L field, then pressing the CLR key on the MCDU control panel.

[6R] DELETE ALL and CONFIRM DELETE ALL	The pilot presses this key to erase all the stored runways, except those in use in the active or secondary flight plan. (The MCDU displays “F-PLN ELEMENT RETAINED”).
[1L] to [6L]	These fields are similar to RUNWAY page fields.

Note: *When 10 runways are stored, entering a new stored runway deletes the first one of the list (1/10).*

Ident.: DSC-22_20-50-10-25-G-00006941.0001001 / 12 FEB 13

NEW RUNWAY PAGE

The pilot can use this page to define and store up to 10 runways.
When the pilot enters an ILS/GLS /LOC ident in the [1R] field, the new navaid page comes up. When the pilot has entered the necessary data in the new navaid page and stored it, the new runway page reappears.

The new runway page and the new navaid page (ILS/GLS ◁ /LOC) are not independent :

- When the flight crew defines the ILS/GLS ◁ /LOC first (on the new navaid page), the new runway page, when called up, already displays the RWY course, RWY ident, and ILS/GLS ◁ ident (copied from the new navaid page).
- When the flight crew defines the runway first (on the new runway page) the new navaid page, when called up, already displays the ILS/GLS ◁ course, ILS/GLS ◁ ident, and runway ident.

The pilot must enter the two directions of a runway on two different new runway pages (LFRJ 08 and LFRJ 26, for example) to allow a flight plan to select either one.

[1L] to [6L]	Enter information about the new runway.
[1R] LS IDENT	Enter the ILS/GLS ◁ /LOC ident. The NEW NAVAID page comes up.
[5R] RETURN	When displayed, pressing this key return to NEW NAVAID page.
[6R] STORE	This prompt appears only when all the amber boxes have been filled.

Note: - *The NEW RUNWAY may be used as departure or destination but no SID or STAR can be associated or stored with this runway. Therefore the pilot will use it as an “independent” airport.*
A new runway is identified by the 4 letter ICAO airport identifier although all six or seven digits must be entered.

ROUTE/STORED ROUTE/NEW ROUTE PAGES

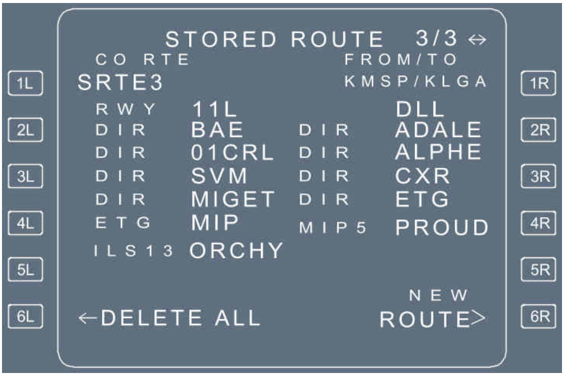
ROUTE PAGES

(Not-modifiable)

[1L] CO RTE	Any company route ident entered in this field causes all the elements of the route to be displayed.
Line 2 to Line 6	These lines display the various route elements, including waypoints and airways.
[1R] FROM/TO	This field is automatically filled when the pilot enters the ident for a company route. When the pilot enters a city pair manually, the MCDU displays “NOT IN DATA BASE” if the city pair is not in the navigation database. If the city pair is in the database, the CO RTE field displays the first route stored (small font, blue). If more than one route is stored, the pilot can slew to see the different routes.

Ident.: DSC-22_20-50-10-25-H-00006945.0001001 / 17 MAR 11

STORED ROUTE PAGE



```

                         NEW
←DELETE ALL            ROUTE>
```

This page displays up to 5 routes stored by the pilot. The stored route are listed and numbered in the order of insertion. The number is displayed in the upper right hand corner of the page.

[1L] CO RTE	This field identifies the stored route. Clearing this field deletes the stored route.
Line 2 to Line 5	The fields in these lines are identical to the corresponding fields in the route page.
[6L] DELETE ALL	Pressing this key changes the label to amber CONFIRM DELETE ALL. Pressing a second time this key deletes all routes previously stored by the crew.

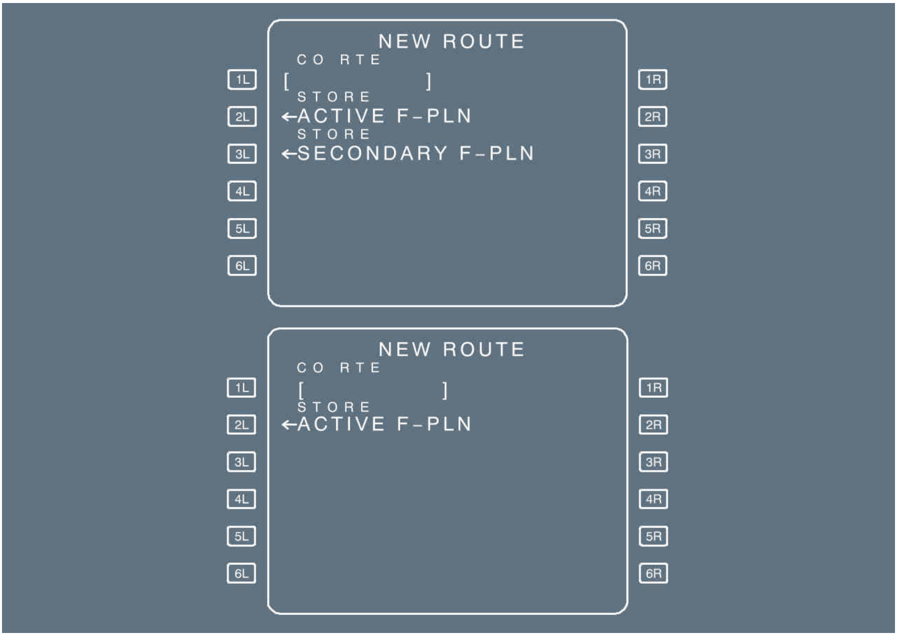
[1R] FROM/TO	This identifies the city pair of the stored route.
[6R] NEW ROUTE	Pressing this key calls up the new route page.

<u>*Note:*</u> *When 5 routes are already stored, the pilot cannot insert a new stored route. The message “STORED ROUTE FULL” is displayed and the pilot must manually delete a route to store a new one.*

Ident.: DSC-22_20-50-10-25-H-00006946.0001001 / 01 OCT 12

NEW ROUTE PAGE

The pilot calls up this page by pressing the NEW ROUTE key on the stored route page. It can be used to store up to five new routes that have already been defined in the active or secondary flight plan.



```
NEW ROUTE
 CO RTE
[           ]
 STORE
←ACTIVE F-PLN
 STORE
←SECONDARY F-PLN
```

```
NEW ROUTE
 CO RTE
 [           ]
 STORE
←ACTIVE F-PLN
```

[1L] CO RTE	This field enables the pilot to enter a new company route ident. If that ident has already been assigned, the entry is rejected.
[2L] STORE ACTIVE F-PLN (blue)	Pressing this key stores parameters of the active flight plan as new route. The display shows this prompt when the system contains a FROM/TO, but only during preflight.

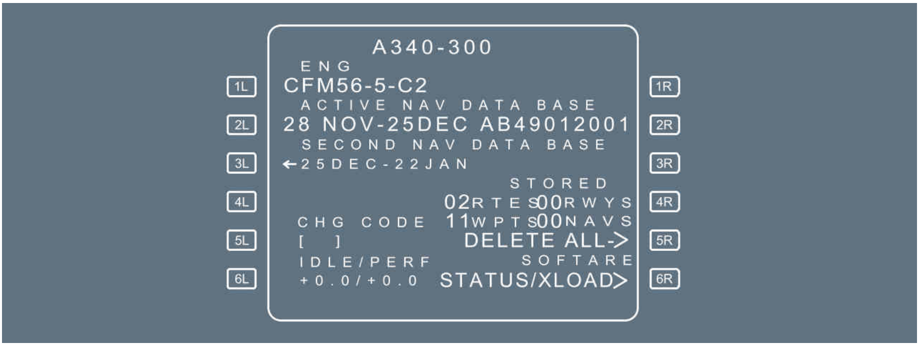
[3L] STORE SECONDARY F -PLN (blue)	Pressing this key stores parameters of the secondary flight plan as new route. The display shows this prompt when the system contains a FROM/TO and the secondary flight plan has not yet been sequenced.

Note:
- *If it has not already been named, a stored route is named automatically when stored : SRTE 1 to SRTE 5.*
- *When 5 routes are already stored, the pilot cannot insert a new route. The “STORED ROUTE FULL” message is displayed, and the pilot must manually delete a route in order to store a new one.*
- *Several elements of the flight plan are not retained, when the route is stored :*
  - *Pilot-entered holds*
  - *Offset*
  - *Pilot-entered constraints*
  - *Modifications to terminal procedures*
  - *Pseudo-waypoints*
  - *Step at optimum.*
  - *Pilot-entered Constant Mach Segment*
    The MCDU then displays “REVISIONS NOT STORED”.

AIRCRAFT STATUS PAGE

Ident.: DSC-22_20-50-10-25-00006947.0001001 / 13 JAN 14
Applicable to: ALL

The system automatically displays this page at power up, but the pilot may also call it up by pressing the DATA key on the MCDU console.



```

  +0.0/+0.0      STATUS/XLOAD>
```

TITLE	AIRCRAFT TYPE
[1L] ENGINE TYPE	The system uses this to calculate predictions.

Note: *When the same performance database is used for different aircraft configurations, the aircraft or engine type displayed in the [1L] field may differ from the actual aircraft.*

[2L] ACTIVE DATABASE	The display shows the validity period and part number in large font.
[3L] SECOND DATABASE	The display shows the validity period and part number in small font. The pilot can press the 3L key to switch to the second database as the active database.

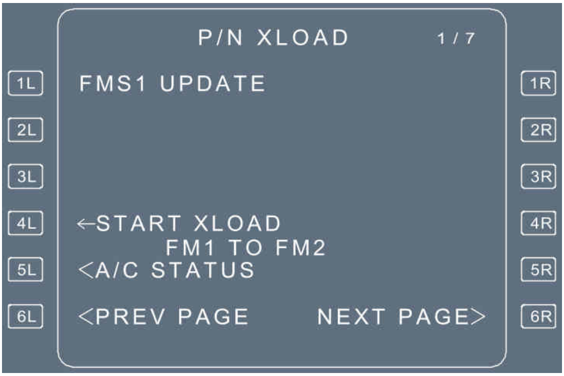
CAUTION	Cycling the database erases the primary and secondary flight plans, as well as stored data. The flight crew must never do this in flight.

[5L] CHG CODE	The maintenance crew can modify the IDLE/PERF factor displayed in [6L]. This field is displayed in the PREFLIGHT and DONE phases. The label is displayed in small white font. The brackets, or the entered value, is displayed in large blue font.
[6L] IDLE/PERF	These factors can only be modified while the aircraft is on ground. If no value has been entered, the databases' default value is displayed in small font. Some aircraft require that the IDLE/PERF factor, be adjusted. To do so, the crew may use the following procedure : - Enter “ARM” in the CHG CODE line's [5L] brackets. - Write the new IDLE/PERF factor in the scratchpad. - Enter this new factor in line [6L]. The entered factor is displayed in large green font. The airline may change the ARM code by modifying the NAV DATABASE policy file.
[4R] STORED	This field displays pilot-stored data in a large green font. The field is blank if no data is stored. (The airline can choose to have this data automatically erased at the done phase).
[5R] DELETE ALL	Pressing this key changes the label to amber CONFIRM DELETE ALL. Pressing this key a second time deletes all pilot–stored data, except data that is part of the active and secondary flight plans.
[6R] STATUS/XLOAD	This prompt gives access to the P/N STATUS and P/N XLOAD pages.

P/N XLOAD PAGE

Ident.: DSC-22_20-50-10-25-00006948.0001001 / 17 MAR 11
Applicable to: ALL

This page allows the crossloading of all the databases or the configuration files' part numbers which are different between both sides. Crossloading from this page avoids reviewing each individual P/N STATUS pages.



P/N XLOAD 1 / 7
FMS1 UPDATE
←START XLOAD
FM1 TO FM2

TITLE	P/N STATUS
Line 1 ELEMENT	Indicate the name of the database or configuration file that can be crossloaded : - FMS SOFTWARE on page 2 - NAV DATA BASE on page 3 - FM AIRLINE CONFIG on page 4 - FM OPTIONS CONFIG on page 5 - PERF DATA BASE on page 6 - FLIGHT TEST DATABASE on page 7.
Line 2 FMS1 P/N Line 3 FMS2 P/N	These fields display the part numbers of the database or configuration file stated on line 1, that are installed on FMS 1 and FMS 2. Identical part numbers are displayed in green, different ones in amber. During crossload, the updated part number is replaced by the amber “ACCEPTING XLOAD” message.

Line 4	This line is empty when the active flight phase is not Preflight or Done. XLOAD FMx TO FMy or START XLOAD FMx TO FMy : This blue prompt is displayed when the database or configuration file stated on line 1 can be crossloaded. XLOAD ARMED : Displayed in blue on the receiving FM when the crossload has been requested, but not yet confirmed. XLOAD IN PROCESS : Displayed in white when the crossload is ongoing. XLOAD NOT SUPPORTED : Crossloading is unavailable for this element. NO P/N TO XLOAD : The element is missing. NEED FG1/FG2 IDENTICAL TO XLOAD : The FG software of the receiving side is incompatible with the FG software to be crossloaded. NEED FM1/FM2 SOFTWARE IDENTICAL TO XLOAD : The crossloaded element is incompatible with the receiving side FM software.
[5L] A/C STATUS	This prompt is available when no crossload is in process. This gives the pilot access to the aircraft status page. MM : SS MIN REMAINING : Displays the time remaining to complete the crossload, when a crossload is in process.
[6L] PREV PAGE ABORT	This key calls up the previous P/N STATUS page. This amber prompt is displayed when a crossload is in process. The pilot uses it to stop the crossload.
[6R] NEXT PAGE CONFIRM*	This key calls up the next P/N STATUS page. This amber prompt is displayed when a crossload has been armed. The pilot presses it to start the crossload.

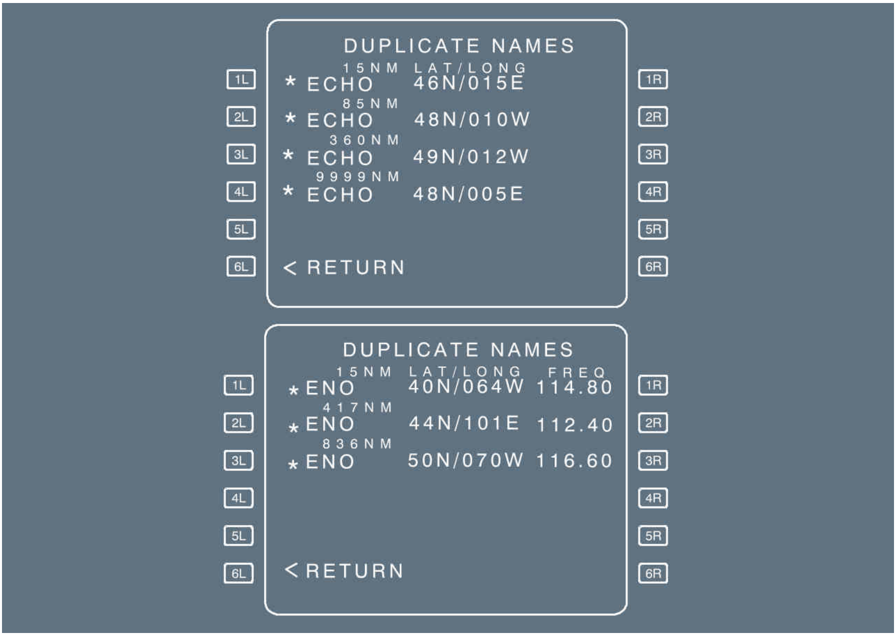
DUPLICATE NAMES PAGE

Applicable to: ALL

Ident.: DSC-22_20-50-10-25-I-00006950.0001001 / 14 MAY 12

GENERAL

This page, which appears automatically, allows the pilot to select a specific waypoint, airport, or navaid when the database holds more than one under the same identifier.



```
     DUPLICATE NAMES
       15NM  LAT/LONG
* ECHO     46N/015E
       85NM
* ECHO     48N/010W
      360NM
* ECHO     49N/012W
     9999NM
* ECHO     48N/005E

< RETURN
```

```
     DUPLICATE NAMES
      15NM  LAT/LONG   FREQ
*ENO       40N/064W  114.80
     417NM
*ENO       44N/101E  112.40
     836NM
*ENO       50N/070W  116.60

<RETURN
```

The pilot presses the key adjacent to a waypoint, navaid, or airport to select it as the one to be entered. When the pilot has finished, the page automatically reverts to the previously displayed page.

Ident.: DSC-22_20-50-10-25-I-00006951.0001001 / 10 DEC 09

DISTANCE

The direct distance to the aircraft is displayed in green above each name. If this distance is greater than 9 999 NM, 9 999 NM is displayed.

Ident.: DSC-22_20-50-10-25-I-00006952.0001001 / 10 DEC 09

LAT/LONG COLUMN

This column lists the rounded off latitudes and longitudes, of the different points using the same identifier.

Ident.: DSC-22_20-50-10-25-I-00006953.0001001 / 12 FEB 13

FREQ/CHAN COLUMN

This column lists the navaids frequencies, if any. It displays CHAN for a GLS ◁ .

Note:
- *The DUPLICATE NAMES page is not displayed when 2 waypoints with the same ident belong to the same airway. The system selects the first waypoint found in the database.*
- *The waypoints or navaids are ranked by their distance from the aircraft position.*
- *When a waypoint is named using ICAO phonetic alpha characters, a minus sign and the ICAO code of the country where the waypoint is located, are displayed. e.g. Alpha in France becomes A-LF ; Bravo in England becomes B-EG.*

POSITION MONITOR PAGE

Ident.: DSC-22_20-50-10-25-J-00006954.0001001 / 14 MAY 12
Applicable to: LV-GKO, LV-GKP

GENERAL

The position monitor page displays all the different positions that the FMGEC has computed with the different methods of navigation available. It also displays which method obtained each position. (The positions should be almost identical).
The flight crew calls up this page by pressing the 1L key on the data index page.

POSITION MONITOR AND POSITION FROZEN PAGE

Line 1 FMGEC 1	This line displays the latitude and longitude as calculated by the FMGEC 1, and the method of navigation the FMGEC used for that calculation (for example, “3IRS/DME/DME”).

Line 2 FMGEC 2	This line displays the latitude and longitude as calculated by the FMGEC 2, and the method of navigation used.
Line 3 RADIO or GPS or GPIRS	This line displays the latitude and longitude the onside FMGEC calculated from selected radio navaids (for example, DME/DME VOR/DME, or LOC) or from GPS or GPIRS.
Line 4 MIX IRS	This line displays the latitude and longitude of the weighted mean inertial reference system (IRS) that the onside FMGEC calculated from the available IRSs.
Line 5 IRS 1,2,3	This line displays the deviation in nautical miles of each IRS position from the onside FMGEC position. It also displays the IRS mode, which can be INVAL, ALIGN, NAV or ATT. *Note:* *INVAL is displayed, when an ADIRS has failed or the IRS position is not refreshed.*
[6L] FREEZE/UNFREEZE	The flight crew presses this key to freeze (or unfreeze) all the data displayed on the page. When the data are frozen, the title of the page specifies the time at which they were frozen.
[6R] SEL NAVAIDS	The flight crew presses this key to gain access to the selected navaids page.

Ident.: DSC-22_20-50-10-25-J-00006955.0004001 / 01 OCT 12

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Line 1 FMGEC 1	This line shows the latitude and longitude as calculated by the FMGEC 1, and the navigation method the FMGEC used for that calculation (for example, “3IRS/DME/DME”).
Line 2 FMGEC 2	This line shows the latitude and longitude as calculated by the FMGEC 2, and the method of navigation used, in white.
Line 3 RADIO or GPS or GPIRS or RADIO DESELECTED	This line shows the latitude and longitude in green calculated by the onside FMGEC from selected radio NAVAIDs (for example, DME/DME, VOR/DME, or LOC) or from GPS or GPIRS. The selected radio NAVAIDs are displayed in white.
Line 4 MIX IRS	This line shows the latitude and longitude of the weighted mean inertial reference system (IRS) calculated by the onside FMGEC from the available IRSs.

Line 5 IRS 1, 2, 3	This line shows the deviation in nautical miles of each IRS position from the onside FMGEC position. It also displays the IRS mode, which can be INVAL, ALIGN, NAV or ATT. *Note:* *INVAL is displayed, when an ADIRS has failed or the IRS position is not refreshed.*
[6L] FREEZE/UNFREEZE	The flight crew presses this key to freeze (or unfreeze) all the data displayed on the page. When the data is frozen, the title of the page specifies the time at which they were frozen.
[6R] SEL NAVAIDS	The flight crew presses this key to gain access to the selected NAVAIDs page.

SELECTED NAVAIDS PAGE

Ident.: DSC-22_20-50-10-25-00006956.0002001 / 17 MAR 11
Applicable to: LV-GKO, LV-GKP

MODIFIABLE ONLY FOR DESELECTION

Line 1	This line displays the navaid tuned for display purposes, and the tuning mode (AUTO, MAN, or RMP).
Line 2 and 3	These lines display the navaids, if any, tuned for the calculation of radio position by the FMGEC.
[4L]	This field displays the tuned ILS (or MLS), if any.
[5L] DESELECT/SELECT GPS	The crew presses this key to manually select or deselect the GPS for position computation. Upon transition to DONE phase the prompt returns to DESELECT status. If the pilot deselects the GPS, “GPS IS DESELECTED” is displayed when the aircraft is at less than 80 NM from the top of descent, or in approach phase.
[6L] RETURN	The pilot presses this key to return to the position monitor page.
[1R] to [6R] DESELECT	The pilot deselects a navaid by entering its identifier in one of these six fields. Once deselected in this way, the navaid can no longer be tuned manually through the entry of its ident, nor can it be autotuned for display or determination of the position for the rest of the flight. The deselection is cleared - manually by a CLR action into this field, or - automatically upon transition to the done or preflight phase, or upon activation of the second database.

The pilot may deselect as many as six stations.

SELECTED NAVAIDS PAGE

[1L]	This field displays the ident of the NAVAID tuned for display purposes, in blue, and the frequency of the NAVAID in green.
[2L] to [3L]	These fields display the ident of the NAVAIDs tuned for the calculation of the radio position by the FMGEC, in blue, and the frequency of the NAVAIDs in green.
[4L]	This field displays the ident of the landing system (XLS) in blue, and the frequency (or the channel) of the landing system in green.

Note: *For fields [1L] to [4L] the class of the tuned NAVAID or the landing systems, and the tuning mode (AUTO, MAN, or RMP) are displayed in white in the label field.*

[5L]	The flight crew presses this key to manually select or deselect the NAVAIDs. If the flight crew selects (deselects) the NAVAIDs for position calculation, “RADIONAV SELECTED” (“RADIONAV DESELECTED”) is displayed in the label line in blue small font and “DESELECT” (“SELECT”) is displayed in white large font. By default NAVAIDs are selected. The deselection of the RADIONAV inhibits use of radio position (either DME/DME or VOR/DME) for position calculation.

[6L]	The flight crew presses this key to manually select or deselect the GPS. If the flight crew selects (deselects) the GPS, “GPS SELECTED” (“GPS DESELECTED”) is displayed in the label line in blue small font and “DESELECT” (“SELECT”) is displayed in white large font. By default GPS is selected. If the flight crew deselects the GPS, “GPS IS DESELECTED” MCDU message is displayed when the aircraft is less than 80 NM from the top of descent, or in approach phase.
[1R] to [5R] DESELECT	The flight crew deselects a NAVAID by entering its identifier in one of these four fields. Once deselected the flight crew can manually tune the NAVAID by entering the ident of the NAVAID for display purposes. The deselection can be cleared: - Manually, by a CLR action in this field, or - Automatically upon transition to the done or preflight phase, or upon activation of the second database. The flight crew may deselects as many as four stations. If the flight crew attempts to deselect a NAVAID that has been previously deselected, the “XXXX IS DESELECTED” MCDU message is displayed.
[6R] RETURN	The flight crew presses this key to return to the POSITION MONITOR page.

IRS MONITOR PAGE

Applicable to: ALL

Ident.: DSC-22_20-50-10-25-K-00006957.0001001 / 14 MAY 12

GENERAL

This page displays the IRS data. The crew calls up this page by pressing the IRS monitor prompt of the DATA INDEX page.

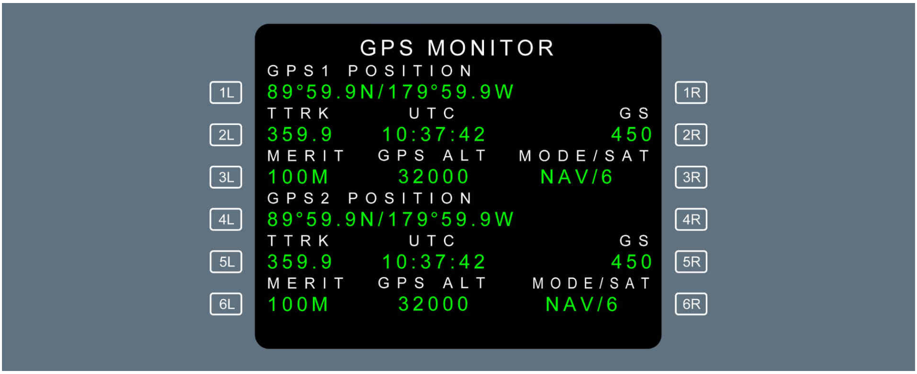
TITLE	Displays the selected IRS in large white font. When data is frozen, IRS is replaced by “IRS FROZEN AT”, followed by the time at which the pilot has frozen the display.
[1L] POSITION	Displays the latitude/longitude given by the selected IRS.
[2L] TTRK	True track
[3L] THDG	True heading
[4L] WIND	True wind direction/velocity
[5L] GPIRS	GPS/IRS hybrid position of the IRS
[6L] FREEZE/UNFREEZE	Allows the crew to freeze or unfreeze all data displayed on all three IRS pages. When the data is frozen, the title of the page specifies the time at which it was frozen. It is automatically unfrozen when the page is exited.
[2R] GS	Ground speed
[3R] MHDG	Magnetic heading
[4R] GPIRS ACCUR	GPS/IRS Figure of Merit (meters or feet)
[6R] NEXT IRS	This prompt enables the display of another IRS page (closed loop IRS 1 → 2 → 3 → 1)

GPS MONITOR PAGE ◁

Ident.: DSC-22_20-50-10-25-00007060.0001001 / 04 NOV 22
Applicable to: ALL

This page displays the GPS data. The flight crew calls up this page by pressing the GPS MONITOR ◁ prompt of the DATA INDEX page.



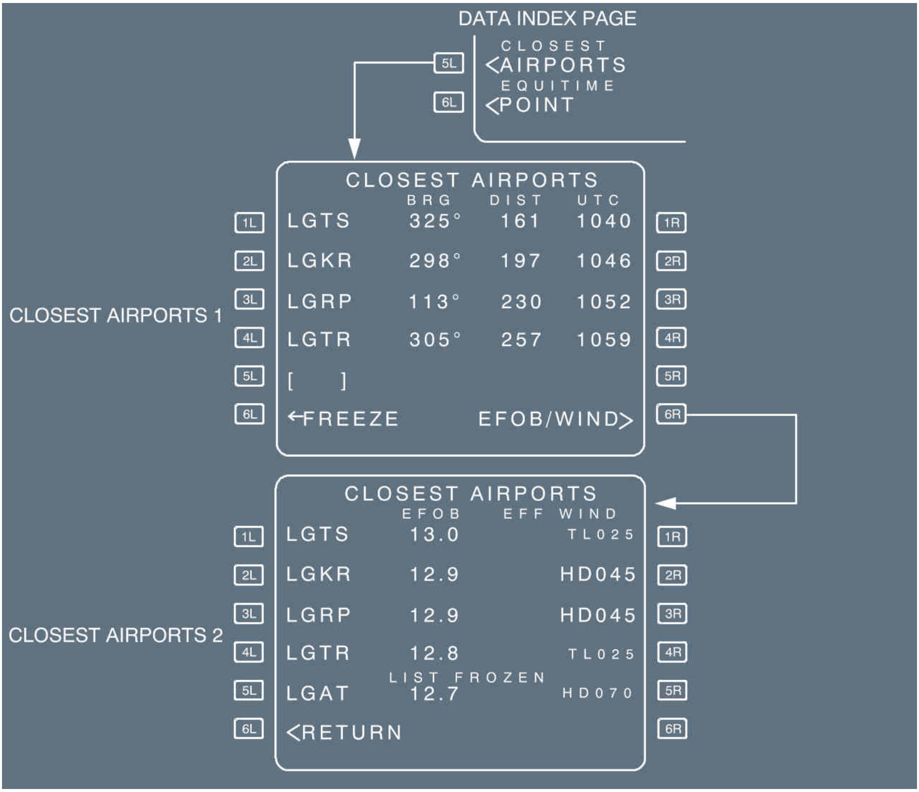
```
              GPS MONITOR
 GPS1 POSITION
 89°59.9N/179°59.9W
 TTRK      UTC           GS
 359.9    10:37:42      450
 MERIT    GPS ALT    MODE/SAT
 100M      32000      NAV/6
 GPS2 POSITION
 89°59.9N/179°59.9W
 TTRK      UTC           GS
 359.9    10:37:42      450
 MERIT    GPS ALT    MODE/SAT
 100M      32000      NAV/6
```

[1L] and [4L]	Display the GPS 1 and 2 positions.
[2L] - [2R] and [5L] - [5R] TTRK-UTC-GS	Display the GPS 1 and 2 true tracks. UTC fields indicate UTC time for each GPS sensor. GS fields indicate the GPS 1 and 2 ground speed.
[3L] - [3R] and [6L] - [6R] MERIT-GPS ALT-MODE/SAT	Display the GPS 1 and 2 figures of merit (in meters or feet). GPS ALT is displayed for information purposes. It is not used by the FMGES. MODE/SAT fields indicate the GPS 1 and 2 modes followed by the number of satellites tracked. The GPS can operate in the following modes: INIT : System initialization ACQ : Satellite acquisition NAV : Normal mode TEST : System test FAULT : Invalid system ALTAID or AIDED : Degraded modes. The MMR uses aircraft inputs for computation purposes. SBAS ◁ : Satellite Based Augmentation System is being used.

CLOSEST AIRPORTS PAGES

Ident.: DSC-22_20-50-10-25-00007077.0001001 / 14 MAY 12
Applicable to: ALL

The system selects automatically the 4 closest airports from the current aircraft position and displays them on these pages. A fifth one can be selected by the pilot.
The page 1 displays the bearing, distance and time to go to each airport, the page 2 displays the EFOB and allows the crew to enter an effective wind to be flown to each airport.
The flight crew accesses the CLOSEST AIRPORTS page 1 by depressing 5L key from DATA INDEX A page, the CLOSEST AIRPORTS page 2 by pressing the EFOB/WIND prompt (6R key) on the page 1.



```
    CLOSEST
<AIRPORTS
    EQUITIME
<POINT
```

```

LGKR       298°   197    1046
LGRP       113°   230    1052
LGTR       305°   257    1059
[    ]
←FREEZE          EFOB/WIND>
```

```
      CLOSEST AIRPORTS
           EFOB    EFF WIND
LGTS       13.0        TL025
LGKR       12.9        HD045
LGRP       12.9        HD045
LGTR       12.8        TL025
         LIST FROZEN
LGAT       12.7        HD070
<RETURN
```

[1L] - [1R] to [4L] - [4R]	The four closest airports are extracted from the database, and ranked by distance from the aircraft position.

BRG	displays the current bearing from the aircraft position to the airport. T is added if true reference is selected.
DIST	displays the current great circle distance from the aircraft position to the airport.
TIME or UTC	displays the predicted time to the airport computed using the current wind or a wind vector entered on the page 2 and the speed according to current mode (managed or selected). The time is only computed in cruise phase.

[5L]	The crew may enter a fifth airport here using the 4 letter code. The entry may be modified at any moment even when the “LIST FROZEN” is displayed.

If the pilot enters an airport that is not in the database, then “NOT IN DATABASE” appears in the scratchpad.

[1L] - [1R] EFOB to [5L] - [5R] EFF WIND	Displays the EFOB at each airport. EFOB is only computed in cruise phase. The pilot may enter here an anticipated headwind or tailwind along the bearing to the airport. If the entry is preceded by +, T, TL a tail wind is assumed. If the entry is preceded by –, H, HD a head wind is assumed. Before the pilot entry, a default value may be displayed, based on the current wind. The effective wind is used to compute the EFOB and time to the airport.
[6L] FREEZE/UNFREEZE	This prompt allows the pilot to freeze and unfreeze the list of four airports. The list is automatically frozen upon accessing the page 2. It will remain frozen upon returning to page 1. The “LIST FROZEN” message is always displayed on page 2.
RETURN	Returns to the page 1.
[6R] EFOB/WIND	Gives access to the page 2. Pressing this prompt automatically freezes the list of four closest airports.

Note:
- *If the aircraft position becomes invalid, all fields are dashed, FREEZE/UNFREEZE and EFOB/WIND prompts are removed, LIST FROZEN is displayed and the A/C POSITION INVALID message is displayed in the scratchpad. Page 2 may not be accessed.*
- *Predictions (EFOB, TIME) displayed on the page assume :*
  - *ECON CRZ speed (managed) or current selected speed (selected) ;*
  - *CI (for managed speed only) and CRZ FL from primary F-PLN are kept ;*
  - *Constant wind value ;*
  - *In case of engine out, the aircraft altitude is the minimum of (CRZ FL, EO REC MAX) ;*
  - *Downpath steps are not considered ;*
  - *Descent fuel burn is a conservative value which only depends on the difference between current CRZ ALT and destination altitude.*

EQUI-TIME POINT PAGE

Ident.: DSC-22_20-50-10-25-00007081.0001001 / 16 MAR 11
Applicable to: ALL

The pilot will use this page to require an equitime point computation between two different points (airport, navaid runway or waypoint). This pseudo-waypoint is displayed on the navigation display along the F-PLN. The EQUI-TIME POINT page is accessed by pressing the 6L key from the DATA INDEX page :

COMPUTED EQUI-TIME POINT

[1L] A/C TO (blue)	Displays reference waypoint 1.
[3L] A/C TO (blue)	Displays reference waypoint 2.

Note: *Origin and destination airports are used by default for respective reference points 1 and 2 until a pilot entry is made.*

[1R] BRG/DIST/UTC and (TIME)	This field displays the bearing, distance, time from the aircraft's current position to the reference waypoint 1.
[3R] (green)	Idem for the reference waypoint 2. BRG : Displays the current great circle bearing from the aircraft's position to the reference waypoint. T is added, if TRUE reference is selected. DIST : Displays the current great circle distance from the aircraft's position to the reference waypoint. TIME : Displays the predicted time to the reference waypoint (computed using the current wind or a wind vector entered by the crew). Time is only computed in cruise phase, otherwise it is dashed.
[2L] and [4L] TRU WIND and (blue)	The pilot may enter the wind (direction/velocity) at the reference waypoint and CRZ FL : This wind is used to compute the time from the aircraft position to the reference waypoint and to locate the equitime point itself. If no entry is made, the wind/velocity field will read zero.
[2R] and [4R] EPT TO XXX and (green)	This field displays the bearing distance and time from the equitime point (ETP) position to the reference waypoint.
[5R] ETP LOCATION	This field displays the ident of the next waypoint following the equitime point. The distance along the flight plan from the equitime point to the indicated waypoint is provided.
[6L] - [6R] A/C TO (ETP) DIST/UTC (green)	This field displays the distance and time from the current aircraft position to the equitime point along the flight plan. If at least one reference waypoint exists but no equitime point exists, the field is blank and NO ETP is displayed in 6L.

Note: *The assumptions for the equitime point computation include the cost index, speed managed (with SPD LIM), and winds.*
In case of engine-out, the EO LRC speed is considered.

PRINT FUNCTION PAGES

Applicable to: ALL

Ident.: DSC-22_20-50-10-25-L-00007085.0003001 / 14 MAY 12

GENERAL

The PRINT FUNCTION pages enable the pilot to print the active data relative to the current flight. The “PRINT FUNCTION” prompt is displayed on the DATA INDEX 1/2 page [6R] key, and gives access to the PRINT FUNCTION page 1 and 2.

PRINT FUNCTION PAGE 1/2

The page displays the manual printing capabilities for
- the active flight plan data (line 1)
- the active takeoff data (line 2)
- the wind data (line 3)

LEFT COLUMN

AUTO (white)	
* YES (blue)	Line 1 : the uplinked flight plan INIT data are automatically printed when received. Line 2 : the uplinked takeoff data are automatically printed at uplink reception. Line 3 : the active wind data are automatically printed at uplink reception.
* NO (blue) :	The report displayed on the line is not automatically printed. The pilot can reactivate the function by pressing the left key of the line.
Blank :	The report displayed on the line is not automatically printed. The pilot cannot reactivate the function, but you can still print manually using the right hand key.
[6L] RETURN	Pressing this key reverts the display to the DATA INDEX page.

RIGHT COLUMN

MANUAL (white)	Displays the status of the manual printing capability of the active data (and not the ACARS uplink data).
PRINT * (amber)	Pressing the right keys prints the following active data : Line 1 : active flight plan init data. Line 2 : active takeoff data. Line 3 : active wind data. If the star is not displayed, the printing is not possible. When the key has been pressed, the star is removed until the data are printed.
[6R] ACARS FUNCTION	Pressing this key reverts the display to the ACARS FUNCTION page.

Ident.: DSC-22_20-50-10-25-L-00007121.0002001 / 17 MAR 11

PRINT FUNCTION PAGE 2/2

This page describes the printing capabilities of the reports displayed on line 1 to 3.

LEFT COLUMN

AUTO (white)	
* YES (blue)	Line 1 : the PREFLIGHT report is automatically printed at engine start. Line 2 : the INFLIGHT report is automatically printed at takeoff. Line 3 : the POSTFLIGHT report is automatically printed at engine shutdown.

* NO (blue)	The report displayed on the line is not automatically printed. The pilot can reactivate the function by pressing the left key of the line.
NO (without a star)	The automatic printing is deactivated internally for the report. The pilot cannot reactivate it.

RIGHT COLUMN

MANUAL	Pressing a right key prints the report displayed on the line.
PRINT *	If the star is not displayed, the printing is not possible. When the key is pressed, the star is removed until the report is printed.
[6R] ACARS FUNCTION	The crew presses this key to revert to the ACARS FUNCTION page.

ACARS FUNCTION PAGE

Ident.: DSC-22_20-50-10-25-00007124.0001001 / 14 MAY 12
Applicable to: ALL

The ACARS FUNCTION pages display the functions that enable the pilot to send manual requests or reports to the ground.
All functions displayed on page 1 and 2 may be inhibited through a pin program of the navigation database policy file.
ACARS/PRINT FUNCTION prompt is displayed on the DATA INDEX page 1/2. Pressing this key displays the PRINT FUNCTION page from which the ACARS FUNCTION page can be accessed.

TITLE	ACARS FUNCTION 1/2 in white

Line 1 F-PLN INIT REQ*	Pressing this key sends a request for flight plan to the ground (downlink message). INIT REQUEST prompt of the INIT A page provides the same function.
Line 2 TO DATA REQ*	Pressing this key sends a request for takeoff data. Displayed in DONE and PREFLIGHT phases. TO DATA REQUEST prompt of the UPLINK TO DATA REQ page provides the same function.
Line 3 WIND DATA REQ*	Pressing this key sends a request for wind data. WIND REQUEST prompt of the CLIMB, CRUISE and DESCENT WIND pages provides the same function.

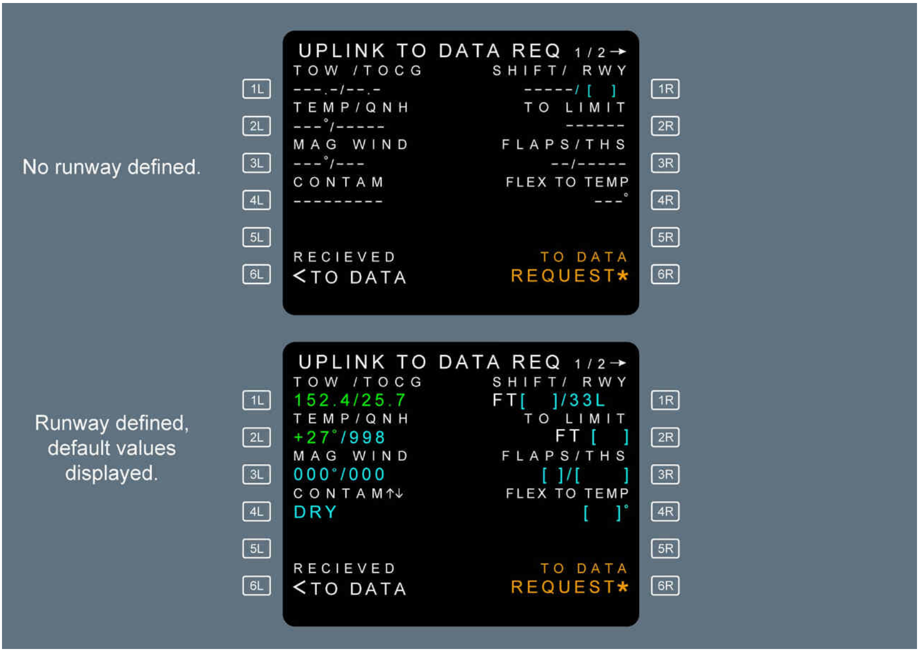
Note: *If "REQ" is not followed by a star, the request cannot be sent (downlink message).*
When a function (line 1 or 2 or 3) is deactivated using the navigation database policy file, the corresponding line is blank.

[6L] RETURN	The pilot presses this key to make the display revert to the DATA INDEX page.
[6R] PRINT FUNCTION	The pilot presses this key to access the PRINT FUNCTION page.

UPLINK TO DATA REQ PAGES

Ident.: DSC-22_20-50-10-25-00007127.0004001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

This page allows the flight crew to send a request for takeoff data for up to 2 runways. There is one page for each runway. The page is accessed from the PERF TAKEOFF page, or from the UPLINK XXX (MAX or FLX or DRT) TO DATA page, by pressing the UPLINK TO DATA prompt.



No runway defined.

```
UPLINK TO DATA REQ  1/2→

```

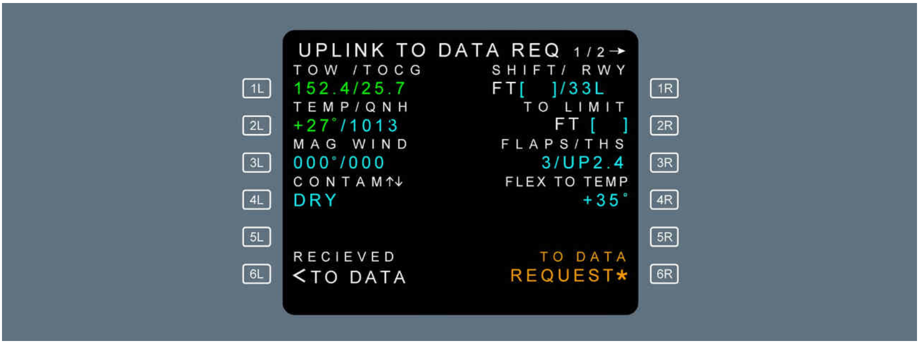
TITLE	The title appears in white.
[1L] TOW/TOCG	This field is dashed, until a runway is defined in the [1R] field. The TOW/TOCG are the values of the INIT FUEL PRED and FUEL PRED pages. If not available, dashes are displayed. They cannot be modified by the flight crew.
[2L] TEMP/QNH or QFE	This field is dashed until a runway is defined in the [1R] field. It displays the temperature at origin and baro setting. If the temperature is not defined, blue brackets are displayed, and the flight crew can modify the temperature according to the weather information. The baro setting is defaulted to FCU selection, and can be modified by the flight crew.
[3L] MAG WIND	This field is dashed, until a runway is defined in the [1R] field. It displays the wind at the origin. If the wind is not defined, blue brackets are displayed. The flight crew can modify this field.

[4L] CONTAM	This field is dashed, until a runway is defined in the [1R] field. The display is defaulted to DRY. The ↑ ↓ keys allow the flight crew to modify the runway contamination: DRY, WET, 1/4 WATER, 1/2 WATER, 1/4 SLUSH, 1/2 SLUSH, COMP SNOW.
[6L] RECEIVED TO DATA	This prompt calls up the UPLINK MAX (or FLX or DRT) TO DATA page that displays the data received by ACARS.



```
UPLINK TO DATA REQ 1/2→
TOW /TOCG              SHIFT/ RWY
152.4/25.7             FT[   ]/33L
TEMP/QNH                 TO LIMIT
+27°/1013                 FT [   ]
MAG WIND                FLAPS/THS
000°/000                  3/UP2.4
CONTAM↑↓             FLEX TO TEMP
DRY                          +35°

RECIEVED                  TO DATA
<TO DATA                 REQUEST*
```

[1R] SHIFT/RWY	This field is dashed until a runway is defined in the F-PLN. If a runway is defined in the F-PLN, it is automatically filled. SHIFT is value from PERF TO page or blue bracket if no value defined. RWY is F-PLN departure runway This field is modifiable by the flight crew.
[2 R] TO LIMIT	It is dashed until a runway is defined in [1R] field. It displays blue bracket when a runway is defined. The flight crew may enter a length considering obstacles on the runway.
[3R] FLAPS/THS	This field is dashed until a runway is defined in [1R] field; then defaulted to values from PERF TO page. Blue brackets are displayed if PERF TO page has no defined values.
[4R] FLEX TO TEMP	This field is dashed until a runway is defined in [1R] field; then it is defaulted to values from the PERF TO page. Blue bracket is displayed if PERF TO page has no defined values. This field is modifiable by the flight crew. The flight crew may enter a FLX TO temperature (FXX)
[6R] TO DATA REQUEST*	Pressing the key sends the takeoff data request message to the ground. The star disappears when the request is sent. The star is displayed again when data are available.

Page 2/2 is a page used for requesting a second runway data.

Note: *If the UPLINK TO DATA REQ page 2 is accessed (page 1 being filled), the fields of page 2 are filled with default values after entry of a runway in [1R]. QNH or QFE, temperature and wind are common with page 1.*

UPLINK TO DATA REQ PAGES

Ident.: DSC-22_20-50-10-25-00007127.0001001 / 14 MAY 12
Applicable to: LV-GKO, LV-GKP

This page allows the pilot to send a request for takeoff data for up to 2 runways. There is one page for each runway. The page is accessed from the PERF TAKEOFF page, or from the UPLINK XXX (MAX or FLX or DRT) TO DATA page, by pressing the UPLINK TO DATA prompt.

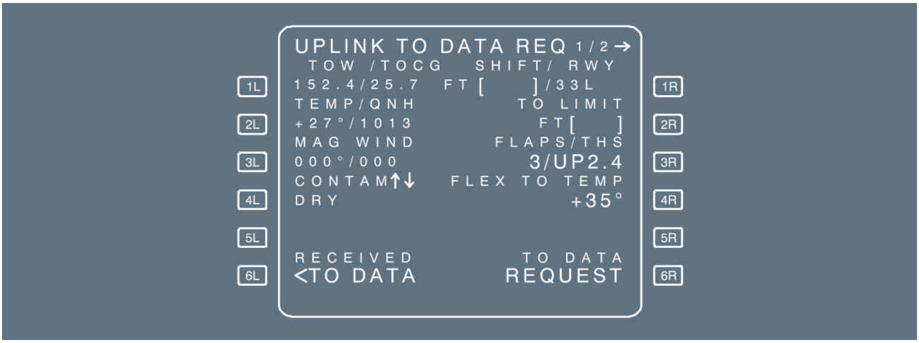
TITLE	The title appears in white.
[1L] TOW/TOCG (green)	This field is dashed, until a runway is defined in the [1R] field. The TOW/TOCG are the values of the INIT B and FUEL PRED pages. If not available, dashes are displayed. They cannot be modified by the pilot.

[2L] TEMP/QNH or QFE (green/blue)	This field is dashed until a runway is defined in the [1R] field : TEMP = Defaulted to SAT ; cannot be modified by the crew. QNH or QFE = Defaulted to FCU selection, and can be modified by the pilot.
[3L] MAG WIND (blue)	This field is dashed, until a runway is defined in the [1R] field, and displays the wind at the origin. It can be modified by the pilot.
[4L] CONTAM (blue)	This field is dashed, until a runway is defined in the [1R] field. The display is defaulted to DRY. The slew keys allow the pilot to modify the runway contamination : DRY, WET, 1/4 WATER, 1/2 WATER, 1/4 SLUSH, 1/2 SLUSH, COMP SNOW.
[6L] RECEIVED TO DATA	This prompt calls up the UPLINK MAX (or FLX or DRT) TO DATA page that displays the data received by ACARS.



```
UPLINK TO DATA REQ 1/2→

[1R] SHIFT/RWY (blue)	This field is dashed until a runway is defined in the F-PLN. If a runway is defined in the F-PLN, it is automatically filled: SHIFT = value from PERF TO page or blue bracket if no value defined. RWY = F-PLN departure runway This field is modifiable by the pilot.
[2 R] TO LIMIT (blue)	It is dashed until a runway is defined in [1R] field. It displays blue brackets [ ] when a runway is defined. The pilot may enter a length considering obstacles on the runway.
[3R] FLAPS/THS (blue)	This field is dashed until a runway is defined in [1R] field; then defaulted to values from PERF TO page. Blue brackets are displayed if PERF TO page has no defined values.

[4R] FLEX TO TEMP (blue)	This field is dashed until a runway is defined in [1R] field; then it is defaulted to values from the PERF TO page. Blue brackets are displayed if PERF TO page has no defined values. This field is modifiable by the pilot. The pilot may enter a FLEX TO temperature (FXX)
[6R] TO DATA REQUEST* (amber)	Pressing the key sends the takeoff data request message to the ground. The star disappears when the request is sent. The star is displayed again when data are available.

Page 2/2 is a page used for requesting a second runway data.

Note: - *If the UPLINK TO DATA REQ page 2 is accessed (page 1 being filled), the fields of page 2 are filled with default values after entry of a runway in [1R]. QNH or QFE and wind are common with page 1.*

UPLINK TO DATA REQ PAGES

Ident.: DSC-22_20-50-10-25-00007127.0003001 / 01 OCT 12
Applicable to: LV-KHT, LV-KHU

This page allows the pilot to send a request for takeoff data for up to 2 runways. There is one page for each runway. The page is accessed from the PERF TAKEOFF page, or from the UPLINK XXX (MAX or FLX or DRT) TO DATA page, by pressing the UPLINK TO DATA prompt.

This page is accessed from the UPLINK TO DATA REQ page by pressing the RECEIVED TO DATA key.
There is a set of 2 pages (MAX TO DATA and FLEX DRT TO DATA) for each of the 4 uplinked runway data. Uplinked data is displayed in green, and cannot be modified by the pilot.

[1L] TOW/TOCG	Uplinked reference takeoff gross weight, and takeoff center of gravity.
[2L] TEMP/QNH (or QFE)	Uplinked temperature and baro setting.

[3L] MAG (TRUE) WIND	Uplinked takeoff runway wind. MAG or TRUE, depending on the runway reference.
[4L] CONTAM	Uplinked takeoff runway contamination.
[5L] THR RED/ACC	Uplinked thrust reduction and acceleration altitudes.
[6L] UPLINK TO DATA	Pressing the key calls up the UPLINK TO DATA REQ page.
V1, VR, V2	Uplinked takeoff speeds.
[1R] SHIFT/RWY	Uplinked TO runway ident, runway intersection, and position shift.
[2R] TO LIMIT	Uplinked runway length remaining.
[3R] FLAPS/THS	Uplinked FLAPS/SLATS CONF and TRIM position.
[4R] FLEX TO	Pressing the key calls up the UPLINK FLEX (or DRT, if derated takeoff option) TO DATA pages.
[5R] ENG OUT ACC	Uplinked engine-out acceleration altitude.
[6R] INSERT UPLINK*	Uplinked takeoff data is available for insertion. Selecting this prompt inserts the following data in the FM : - V1, VR, V2 - THR RED/ACC, ENG OUT ACC altitudes - MAG WIND - FLAPS/THS - SHIFT - FLEX or DRT

The display reverts to the PERF TO page ; the asterisk disappears.
This field is not displayed, if the runway does not match the active runway, or if the uplinked TOW/TOCG differs from the current TOW/TOCG (if already existing). The “CHECK TAKEOFF DATA” message is displayed on the MCDU scratchpad.

Note: *All previously-received data is replaced by the new uplinked data.*

 UPLINK              INSERT
<TO DATA            UPLINK *
```

This page is accessed from the UPLINK TO DATA REQ page by pressing the RECEIVED TO DATA key.
There is a set of 2 pages (MAX TO DATA and FLEX DRT TO DATA) for each of the 4 uplinked runway data. Uplinked data is displayed in green, and cannot be modified by the pilot.

[1L] TOW/TOCG	Uplinked reference takeoff gross weight, and takeoff center of gravity.
[2L] TEMP/QNH (or QFE)	Uplinked temperature and baro setting.
[3L] MAG (TRUE) WIND	Uplinked takeoff runway wind. MAG or TRUE, depending on the runway reference.
[4L] CONTAM	Uplinked takeoff runway contamination.
[5L] THR RED/ACC	Uplinked thrust reduction and acceleration altitudes.
[6L] UPLINK TO DATA	Pressing the key calls up the UPLINK TO DATA REQ page.
V1, VR, V2	Uplinked takeoff speeds.

[1R] SHIFT/RWY	Uplinked TO runway ident, runway intersection, and position shift.
[2R] TO LIMIT	Uplinked runway length remaining.
[3R] FLAPS/THS	Uplinked FLAPS/SLATS CONF and TRIM position.
[4R] FLEX TO	Pressing the key calls up the UPLINK FLEX (or DRT, if derated takeoff ◁ option) TO DATA pages.
[5R] ENG OUT ACC	Uplinked engine-out acceleration altitude.
[6R] INSERT UPLINK*	Uplinked takeoff data is available for insertion.

Selecting this prompt inserts the following data on the PERF TO page :
- V1, VR, V2
- THR RED/ACC, ENG OUT ACC altitudes
- FLAPS/THS
- SHIFT
- FLEX or DRT ◁

The display reverts to the PERF TO page and the selection star (*) disappears.
If the runway does not match the active runway, this field is not displayed.

If the runway matches the active runway but the uplinked TOW differs from the current TOW (the uplinked TOW is 3 t greater or 1 t lower than the TOW estimated by the FMS):
- The selection star (*) disappears and the insertion is not possible
- The TOW value is displayed in amber in [1L] field.

Note: *All previously-received data is replaced by the new uplinked data.*

UPLINK FLX (OR DRT) TO DATA PAGES

ACARS FUNCTION PAGE 2

Line 1 F-PLN RPT SEND	This key, when pressed, sends the flight plan report to the ground.
Line 2 POSITION RPT SEND	This key, when pressed, sends a Position Report to the ground.

Note:
- *No report can be sent if “SEND” is not followed by a star*
- *When a function (line 1 or 2) is deactivated through the navigation database policy file, the corresponding line is blank.*

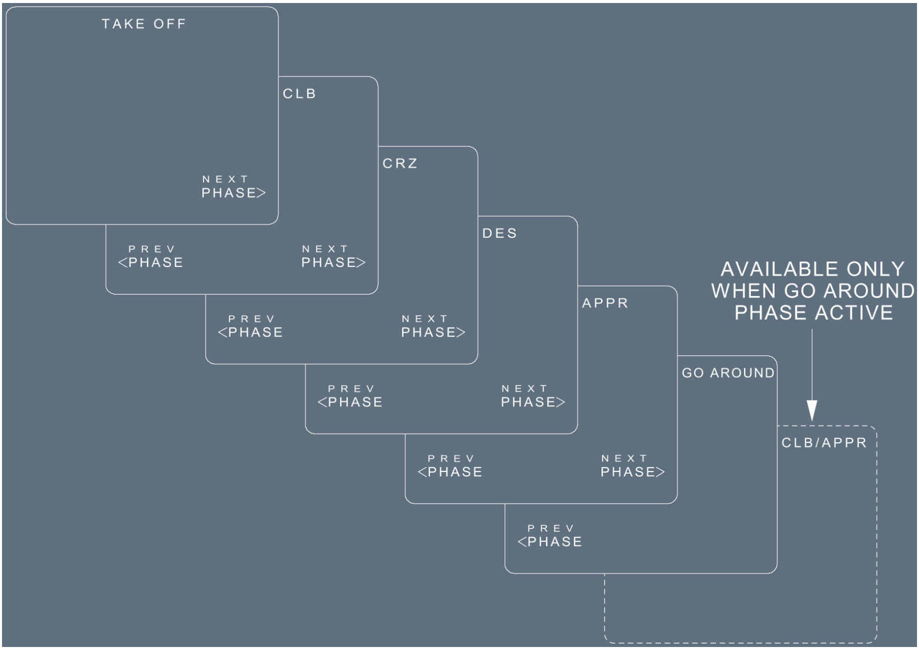
[6L] RETURN	The pilot presses this key to make the display revert to the DATA INDEX page.
[6R] PRINT FUNCTION	The pilot presses this key to access the PRINT FUNCTION page.

PERF PAGES

Ident.: DSC-22_20-50-10-25-00007142.0001001 / 17 MAR 11
Applicable to: ALL

The flight plan is divided into several phases :
PREFLIGHT - TAKEOFF - CLIMB - CRUISE - DESCENT - APPROACH - GO-AROUND - DONE
Each phase except the preflight and done phases has a performance (PERF) page. The PERF pages display performance data, speeds related to the various phases, and predictions.

Pressing the PERF key on the MCDU console calls up the performance page for the current active phase. Performance pages relating to phases already flown are not available.
In the preflight and done phases, pressing the PERF key brings up the takeoff performance page. Pressing the PERF key in the done phase makes the phase transition to the preflight phase.



TAKE OFF
NEXT PHASE>

PREV <PHASE
NEXT PHASE>
DES
PREV <PHASE
NEXT PHASE>
APPR
PREV <PHASE
NEXT PHASE>
GO AROUND
PREV <PHASE
AVAILABLE ONLY WHEN GO AROUND PHASE ACTIVE
CLB/APPR

The FMGES flight phase are not related to the FWC phases.

Line 6	Fields may display two different prompts, depending upon whether the phase is active or not.
[6L] PREV PHASE	To review the performance page for the previous phase. The prompt is neither available on the takeoff performance page, nor for the phases already flown.
[6L] ACTIVATE APPR PHASE	To activate, then confirm, the APPR phase. Only available on the page corresponding to the active phase.
[6R] NEXT PHASE	To review the performance page for the next phase.

Note: ***Engine-out condition***

- *When the FMGES detects an engine-out condition, the system automatically calls up the performance page for the current flight phase (except when this occurs before the diversion point during takeoff or no EOSID exists in the flight plan) and displays "EO CLR*" in the [1R] field and "EO LRC" (engine-out long range cruise) in the [2L] field.*
  On the CLB, CRZ and DES (when the descent phase is not active) PERF pages, the pilot can enter a cost index value and overwrite to "EO LRC".
  Clearing the cost index reverts to EO LRC.
  If the pilot presses the [1R] key, the system reverts to the normal processing (with no engine failed) and suppresses the EO information. (Refer to DSC-22_20-30-10-05 General).
- *If the engine-out condition is detected before the diversion point at takeoff, a temporary flight plan is created.*

TITLE

TAKE OFF appears, when the takeoff phase is active.
TAKE OFF appears, when the takeoff phase is inactive.

[1L] V1 [2L] VR [3L] V2

Amber boxes are displayed as long as no entries have been performed.
The flight crew can modify any entry, as long as the takeoff phase is inactive.

Note:
- *If the flight crew does not enter V2, the SRS mode will not be available at takeoff.*
- *If the flight crew enters V1, VR or V2 and the takeoff runway, or the takeoff shift, is changed, but the origin airport remains the same, the MCDU scratchpad displays CHECK TAKEOFF DATA. However, all the takeoff parameters are retained.*

[4L] TRANS ALT

This indicates the transition altitude.
The flight crew can call this up from the database after the origin airport is defined. The flight crew can modify it.

[5L] THR RED	This indicates the thrust reduction altitude. This is the altitude at which the flight crew should reduce the thrust from TOGA/FLX to MAX CLIMB (CL detent) with all engines operative. - The default thrust reduction is 1 500 ft above the runway elevation. - The flight crew can modify this altitude: The minimum is 400 ft above the runway elevation.
ACC	This indicates the acceleration altitude. This is the altitude at which the climb phase is triggered. - The target speed jumps to the initial climb speed. - The default value is 1 500 ft above runway elevation. - The flight crew can modify the value. The minimum value is 400 ft above runway elevation. However, it is always higher than, or equal to, thrust reduction altitude. *Note:* - *A clearing action reverts both values to the default ones.* - *When the flight crew selects an altitude on the FCU that is:* • *Below ACC, it brings the ACC down to this altitude.* • *Below THR RED, it brings THR RED and ACC down to this altitude (the 400 ft minimum still applies).*
[6L] UPLINK TO DATA <*	This key calls up the UPLINK TO DATA REQ page. It is only displayed in the PREFLIGHT and DONE phases, when ACARS is installed.
[1R] RWY	This field shows the takeoff runway selected on the active flight plan. The flight crew cannot make an entry from this field. The field shows dashes, if no runway has been inserted in the flight plan.
[2R] TO SHIFT	The takeoff shift is the distance in meters or feet between the beginning of the runway and the aircraft's takeoff position. When taking off from an intersection, the flight crew should insert this value to ensure a correct update of the FM position. The takeoff shift value must be positive, and cannot be greater than the available takeoff run.
[3R] FLAPS/THS	This is an optional flight crew entry for the positions of the flaps and the THS at takeoff. The FLAP setting is used by the FWC to trigger the "FLAP/MCDU DISAGREE" ECAM caution. The flight crew can modify it until takeoff, by entering "UP X.X" or "X.X UP", or "DN X.X" or "X.X DN" for the THS.

[4R] DRT TO-FLX TO	The flight crew may either insert the FLX TO temperature (i.e F45) for FLX takeoff setting purposes, or a Derated takeoff level (i.e. D04). It can only be entered during preflight. The system sends it to the FADEC, and displays it on the upper ECAM display. The TEMP value is always entered in degrees Celsius.
[5R] ENG OUT ACC	This indicates the engine-out acceleration altitude, as defined in the database, or as manually entered by the flight crew. This is for display only, as a reminder. It cannot be cleared. The above ACC rules of [5L], apply to this field.
[6R] NEXT PAGE	This key calls up the climb performance page.

PERF TAKEOFF PAGE

Ident.: DSC-22_20-50-10-25-00007197.0010001 / 05 MAY 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

During the preflight phase, the flight crew presses the PERF key to call up the takeoff performance page.

Flaps/Slats retraction speeds and GREEN DOT speeds provided by the FMGEC, once aircraft GW has been computed

TITLE	TAKE OFF RWY appears, when the takeoff phase is active. TAKE OFF RWY appears, when the takeoff phase is inactive. The active flight plan selected runway is displayed in large green font.

Note: *If the takeoff shift, or the flaps/THS, or the runway is changed after V1, VR or V2 insertion, but the origin airport remains the same, the MCDU CHECK TAKEOFF DATA message appears. All takeoff parameters are retained except in case of runway change. In case of runway change, the parameters are invalidated, but still displayed adjacent to each field. The “CONFIRM TO DATA” prompt in [6R] allows reverting to the previous valves.*

[1L] V1 [2L] VR [3L] V2	Amber boxes are displayed as long as no entries have been performed. The flight crew can modify any entry, as long as the takeoff phase is inactive. Note: *1. If the flight crew does not enter V2, the SRS mode will be unavailable at takeoff.* *2. The MCDU V1/VR/V2 DISAGREE message appears if the inserted V1, VR, V2 do not satisfy the condition: V1 ≤ VR ≤ V2.* *3. The MCDU TO SPEED TOO LOW message appears if the inserted V1, VR, V2 speeds do not satisfy the existing regulatory conditions regarding VMCG/VMCA and VS1G speeds.*
[4L] TRANS ALT	This indicates the transition altitude. This field displays the navigation database default altitude (if defined), once the origin airport is entered. The flight crew can modify it.
[5L] THR RED	This indicates the thrust reduction altitude. This is the altitude at which the flight crew should reduce the thrust from TOGA/FLX to MAX CLIMB (CL detent) with all engines operative (“CLB” or “LVR CLB” flashing on the FMA). - The default thrust reduction altitude is 1 500 ft above the runway elevation, or the altitude set by the airline. - The flight crew can modify this altitude: The minimum is 400 ft above the runway elevation.

ACC	This indicates the acceleration altitude. This is the altitude at which the climb phase is triggered. - The target speed jumps to the initial climb speed. - The default value is 1 500 ft above runway elevation. - The flight crew can modify the value. The minimum value is 400 ft above runway elevation, and it can be higher than, equal to or lower than thrust reduction altitude. *Note:* - *A clearing action reverts both values to the default ones.* - *When the flight crew selects an altitude on the FCU that is:* • *Below ACC, it brings the ACC down to this altitude.* • *Below THR RED, it brings THR RED and ACC down to this altitude (the 400 ft minimum still applies).*
[6L] UPLINK TO DATA	This key calls up the UPLINK TO DATA REQ page. It is only displayed in the PREFLIGHT and DONE phases, when ACARS is installed.
[1R] EO CLR	EO CLR is displayed when an engine-out is detected when the active flight phase is Takeoff.
[2R] TO SHIFT	The takeoff shift is the distance in meters or feet between the beginning of the runway and the aircraft’s takeoff position. When taking off from an intersection, the flight crew should insert this value to ensure a correct update of the FM position. The takeoff shift value must be positive, and cannot be greater than the available takeoff run.
[3R] FLAPS/THS	This is a flight crew entry for the positions of the flaps and the THS at takeoff. The FLAP and THS setting are respectively used by the FWC to trigger the ”FLAP/MCDU DISAGREE” and “PITCH TRIM/MCDU/CG DISAGREE” ECAM cautions. The flight crew can modify it until takeoff, by entering “UP X.X” or “X.X UP”, or “DN X.X” or “X.X DN” for the THS.
[4R] DRT TO - FLX TO	The flight crew may either insert a FLX TO temperature (e.g. F45) for Flex Takeoff setting purposes, or a Derated Takeoff level (e.g. D04). The flight crew can enter it only during preflight. The system sends it to the FADEC, and displays it on the upper ECAM display. The TEMP value is always entered in degrees Celsius.
[5R] ENG OUT ACC	This indicates the engine-out acceleration altitude, as defined in the database, or as manually entered by the flight crew. This is for display only, as a reminder. It cannot be cleared. The above ACC rules of [5L] apply to this field.

[6R] NEXT PAGE or CONFIRM TO DATA*	This key calls up the climb performance page, or allows the flight crew to revert to the previously-entered T.O parameters in case of runway change with the same origin airport.

```

TITLE	CLB is displayed in large white fonts when the climb phase is inactive, and in large green fonts if it is active.
[1L] ACT MODE	This field displays the preselected active speed mode: SELECTED or MANAGED. The flight crew cannot modify it from this field.

[2L] CI (Cost Index)	This field displays the cost index, as initialized on the INIT A or defaulted from the database, or inserted in this field by the flight crew. *Note:* *In case of engine-out EO LRC (Engine-Out Long Range Cruise) replaces the CI field.* *You can enter a cost index and overwrite EO LRC. In this case, clearing the cost index reverts to EO LRC.*
[3L] MANAGED	This field displays the FMGES-computed ECON speed/Mach (*Refer to DSC-22_20-10 General*). Before the CLIMB phase is active, if the preselected speed mode is SELECTED, a star is displayed next to the MANAGED speed. In this case, pressing the 3L key preselects MANAGED speed, and 4L field reverts to brackets.
[4L] PRESEL or SELECTED	If the climb phase is not active: This field displays PRESEL, as long as the climb phase is not active. The flight crew can only enter a preselected speed. If the climb phase is active: The title of this field becomes SELECTED. This field displays the selected (or preselected) SPD or MACH target. The flight crew cannot directly modify it this field, but can adjust it with the SPD/MACH selection knob on the FCU. If the flight crew pushes in the FCU SPD/MACH selection knob to revert to managed speed, the system selects (or reselects) ECON SPD/MACH, and [4L] is blank.
[5L] Blank or EXPEDITE	This field is blank, as long as the climb phase is not active. This field displays this legend when the climb phase is active. The flight crew cannot engage EXPEDITE from this field. It indicates the time and distance required to reach the altitude displayed in the 2R field, in case of a climb at green dot.
[6L] PREV PHASE	This field displays this legend, if the climb phase is not active. The flight crew presses this key to call up the takeoff page.
[6L] ACTIVATE APPR PHASE	The field displays this legend, if the climb phase is active. Pressing this key once displays “CONFIRM APPR PHASE*”. Pressing it again activates the approach phase.
[1R] EO CLR or DRT CLB ◁	The system displays the EO CLR prompt, in case of an engine-out in climb, or DRT CLB when the crew selected a derated climb ◁ .

[2R] PRED TO...	This field displays the target altitude for the predictions shown in 3R, 4R, or 5L. It defaults to the FCU altitude, but the flight crew can modify it to any altitude below CRZ FL.
[3R] or [4R]	These fields show target altitude predictions selected in the [2R] field for the current vertical mode and target speed. [3R] field: Predictions for ECON speed (managed) [4R] field: Predictions for SPD manually selected These fields are only displayed while the takeoff, or climb phase is active.
[6R] NEXT PHASE	The pilot presses this key to call up the PERF CRZ page.

PERF CRUISE PAGE WITH PREPLANNED STEP

TITLE	CRZ in white large font, when cruise phase is not active, in green large font, when it is.

[1L] ACT MODE	This field shows the active speed/Mach target : SELECTED or MANAGED (ECON). The pilot cannot modify it through this field.
[2L] CI	This field shows the cost index as initialized on the init A page or defaulted from the database, or as inserted in this field by the crew. EO LRC replaces automatically the cost index value in case of engine out.
[3L] MANAGED	When the speed target is managed, the FMGES computes the ECON speed. This field displays the ECON speed/Mach : ECON is the optimum speed or Mach, in terms of time and fuel cost ratio, related to the active flight plan, weather, cruise flight level, and gross weight.
[4L] PRESEL or SELECTED	If cruise phase is not active: The pilot can enter a preselected speed or Mach number. If cruise phase is active: This field is blank.

Note: *When the cruise phase is not yet active, a * symbol appears next to the selectable speed (or Mach).*

Note: *If the flight crew enters a value in the PRESEL field during the cruise altitude capture (ALT CRZ*), the FCU selected speed may revert to M 0.01.*

[6L] PREV PHASE or	The pilot can press this key to call up the climb page, if the cruise phase is not yet active.
[6L] ACTIVATE APPR PHASE	This field displays this legend if the cruise phase is active. The flight crew presses the key once to change the legend to “CONFIRM APPR PHASE*”. A second press activates the approach phase. Note: *If the pilot inadvertently activates the approach phase, it can reselect the cruise flight level into the progress page to reactivate the cruise phase.*
[1R] TIME/UTC DES EFOB	Before takeoff, this field displays the flight time to destination and the predicted remaining fuel on board. If the crew enters an estimated takeoff time, the field automatically displays the predicted arrival time at destination (UTC). After takeoff, it displays the predicted arrival time at destination (UTC) and the remaining fuel on board at destination (DEST EFOB) in green font. The DEST EFOB field will turn to amber, if the EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page. EO CLR is displayed when an engine-out is detected.

[2R] STEP TO FL XX DRIFT DOWN TO FLXX, or TO T/D	This field, in combination with 3R, displays the predictions for the step point and the step altitude, the drift down altitude, or the Top of Descent.
[3R] TIME/UTC and DIST	This field displays the time and distance to go to the various points identified in 2R.
[4R] DES CABIN RATE	This field displays Max (computed DES cabin rate, maximum descent cabin rate). The pilot may modify the value : The FM then recomputes the top of descent, in order to match this value. If the FM cannot match the pilot entry, the FM-computed value overwrites the pilot entry. A clear action reverts to the default value (-350 ft/min). As DES CAB RATE is a negative value, “minus” is not a necessary entry.
[5R] STEP ALTS	This key calls up the STEP ALTS page (see vertical revision).
[6R] NEXT PHASE	This key calls up the DES page.

DES PHASE ACTIVE WITH
SELECTED SPEED/MACH

TITLE	DES in a white large font when the descent phase is not active and in a green large font, when it is active.
[1L] ACT MODE	This field displays the active speed target (MANAGED or SELECTED). The flight crew cannot modify it through this field.
[2L] CI	This field displays the cost index, as initialized on the INIT A page or defaulted from the database, or inserted in this field by the flight crew. The flight crew cannot modify it when the descent phase is active.

[3L] MANAGED	Before the flight crew makes any entry. This field displays MANAGED in white, with the associated ECON descent Mach or speed in blue. The crew may overwrite the ECON descent Mach or speed by entering a Mach number and/or a speed in this field. The system uses the pilot entry to compute the descent profile. The descent may be flown in managed using this new pilot entry. The flight crew can modify this field as follow: - enter only a new speed and keep the same managed Mach number (entry format: /XXX), or - enter a new target speed and enable the FMS to compute a new managed Mach number with the highest possible cross-over altitude (entry format: XXX), or - clear the entry to revert to ECON Mach/speed.
[4L] blank or [4L] MACH/SPD	If the descent phase is not active, this field is blank. If the descent phase is active : The field displays the speed or Mach target manually selected by the pilot. “SELECTED” is displayed in the [1L] field. To modify the field value, the pilot will use the SPD/MACH selector knob of the FCU. [4L] field and FCU window will display the same value. Pushing in the FCU speed selector knob activates the managed SPD/MACH target displayed in the [3L] field.
[5L] Blank or [5L] EXPEDITE	If the descent phase is not active this field is blank. If the descent phase is active, this field displays EXPEDITE, if EXPEDITE mode is selected on FCU. It indicates the time and distance required to reach the altitude displayed in the [2R] field at MMO/VMO speed. The flight crew cannot select the EXPEDITE mode through this field.
[6L] PREV PHASE or ACTIVATE APPR PHASE	This key calls up the cruise phase page if the descent phase is not yet active. Displays if the descent phase is active. First press causes “CONFIRM APPR PHASE” to be displayed. Second press activates the approach phase.

[1R] TIME/UTC	DEST EFOB Before takeoff, this field displays the flight time to destination and the predicted remaining fuel on board. If the crew enters an estimated takeoff time, the field automatically displays the predicted arrival time at destination (UTC). After takeoff, it displays the predicted arrival time at destination (UTC) and the remaining fuel on board at destination (DEST EFOB) in green font. The DEST EFOB field will turn to amber, if the EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page. EO CLR is displayed when an engine-out is detected.
[2R] PRED TO...	This field displays the target altitude for the predictions in [3R] [4R], or [5L] . The display defaults to the altitude selected on the FCU. The flight crew can modify it to any altitude lower than present altitude.
[3R]	These fields display altitude predictions down to the target altitude selected in [2R], computed for the current vertical mode (DES or OP DES) and the indicated target speed. [3R] field : shows predictions for the “MANAGED” SPD/MACH profile.
[4R]	[4R] field : displays predictions for a SPD/MACH. Fields [3R] and [4R] are displayed only when DES phase is active
[6R] NEXT PHASE	The pilot presses this key to call up the PERF APPR page.

TITLE	DES in a white large font when the descent phase is not active and in a green large font, when it is active.
[1L] ACT MODE	This field displays the active speed target (MANAGED or SELECTED). The flight crew cannot modify it through this field.
[2L] CI	This field displays the cost index, as initialized on the INIT A page or defaulted from the database, or inserted in this field by the flight crew. The flight crew cannot modify it when the descent phase is active.

[3L] MANAGED	If the descent phase is not active : Before the flight crew makes any entry. This field displays MANAGED in white, with the associated ECON descent Mach or speed in blue. The crew may overwrite the ECON descent Mach or speed by entering a Mach number or a speed in this field. The system uses the pilot entry to compute the descent profile. The descent may be flown in managed using this new pilot entry. The entry is modifiable. It can be cleared to revert to ECON speed/Mach If the descent phase is active : The flight crew cannot make an entry in this field. The field displays the ECON speed/Mach or the speed/Mach value previously entered by the pilot.
[4L] blank or [4L] MACH/SPD	If the descent phase is not active, this field is blank. If the descent phase is active : The field displays the speed or Mach target manually selected by the pilot. “SELECTED” is displayed in the [1L] field. To modify the field value, the pilot will use the SPD/MACH selector knob of the FCU. [4L] field and FCU window will display the same value. Pushing in the FCU speed selector knob activates the managed SPD/MACH target displayed in the [3L] field.
[5L] Blank or [5L] EXPEDITE	If the descent phase is not active this field is blank. If the descent phase is active, this field displays EXPEDITE, if EXPEDITE mode is selected on FCU. It indicates the time and distance required to reach the altitude displayed in the [2R] field at MMO/VMO speed. The flight crew cannot select the EXPEDITE mode through this field.
[6L] PREV PHASE or ACTIVATE APPR PHASE	This key calls up the cruise phase page if the descent phase is not yet active. Displays if the descent phase is active. First press causes “CONFIRM APPR PHASE” to be displayed. Second press activates the approach phase.
[1R] TIME/UTC	DEST EFOB Before takeoff, this field displays the flight time to destination and the predicted remaining fuel on board. If the crew enters an estimated takeoff time, the field displays automatically the predicted arrival time (UTC) at destination. After takeoff, it displays the predicted arrival time at destination (UTC) and the remaining fuel on board.

[2R] PRED TO...	This field displays the target altitude for the predictions in [3R] [4R], or [5L] . The display defaults to the altitude selected on the FCU. The flight crew can modify it to any altitude lower than present altitude.
[3R]	These fields display altitude predictions down to the target altitude selected in [2R], computed for the current vertical mode (DES or OP DES) and the indicated target speed. [3R] field : shows predictions for the “MANAGED” SPD/MACH profile.
[4R]	[4R] field : displays predictions for a SPD/MACH. Fields [3R] and [4R] are displayed only when DES phase is active
[6R] NEXT PHASE	The pilot presses this key to call up the PERF APPR page.

DES PHASE NOT ACTIVE WITH MANAGED SPEED/MACH SELECTION

DES PHASE ACTIVE WITH SELECTED SPEED/MACH

TITLE	DES in a white large font when the descent phase is not active and in a green large font, when it is active.
[1L] ACT MODE	This field displays the active speed target (MANAGED or SELECTED). The flight crew cannot modify it through this field.
[2L] CI	This field displays the cost index, as initialized on the INIT A page or defaulted from the database, or inserted in this field by the flight crew. The flight crew cannot modify it when the descent phase is active.

[3L] MANAGED	If the descent phase is not active : Before the flight crew makes any entry. This field displays MANAGED in white, with the associated ECON descent Mach or speed in blue. The crew may overwrite the ECON descent Mach or speed by entering a Mach number or a speed in this field. The system uses the pilot entry to compute the descent profile. The descent may be flown in managed using this new pilot entry. The entry is modifiable. It can be cleared to revert to ECON speed/Mach If the descent phase is active : The flight crew cannot make an entry in this field. The field displays the ECON speed/Mach or the speed/Mach value previously entered by the pilot.
[4L] blank or [4L] MACH/SPD	If the descent phase is not active, this field is blank. If the descent phase is active : The field displays the speed or Mach target manually selected by the pilot. “SELECTED” is displayed in the [1L] field. To modify the field value, the pilot will use the SPD/MACH selector knob of the FCU. [4L] field and FCU window will display the same value. Pushing in the FCU speed selector knob activates the managed SPD/MACH target displayed in the [3L] field.
[5L] Blank or [5L] EXPEDITE	If the descent phase is not active this field is blank. If the descent phase is active, this field displays EXPEDITE, if EXPEDITE mode is selected on FCU. It indicates the time and distance required to reach the altitude displayed in the [2R] field at MMO/VMO speed. The flight crew cannot select the EXPEDITE mode through this field.
[6L] PREV PHASE or ACTIVATE APPR PHASE	This key calls up the cruise phase page if the descent phase is not yet active. Displays if the descent phase is active. First press causes “CONFIRM APPR PHASE” to be displayed. Second press activates the approach phase.
[1R] TIME/UTC	DEST EFOB Before takeoff, this field displays the flight time to destination and the predicted remaining fuel on board. If the crew enters an estimated takeoff time, the field automatically displays the predicted arrival time at destination (UTC). After takeoff, it displays the predicted arrival time at destination (UTC) and the remaining fuel on board at destination (DEST EFOB) in green font. The DEST EFOB field will turn to amber, if the EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page. EO CLR is displayed when an engine-out is detected.

[2R] PRED TO...	This field displays the target altitude for the predictions in [3R] [4R], or [5L] . The display defaults to the altitude selected on the FCU. The flight crew can modify it to any altitude lower than present altitude.
[3R]	These fields display altitude predictions down to the target altitude selected in [2R], computed for the current vertical mode (DES or OP DES) and the indicated target speed. [3R] field : shows predictions for the “MANAGED” SPD/MACH profile.
[4R]	[4R] field : displays predictions for a SPD/MACH. Fields [3R] and [4R] are displayed only when DES phase is active
[6R] NEXT PHASE	The pilot presses this key to call up the PERF APPR page.

F, S, GREEN DOT and VLS speeds computed by the FG assuming the landing weight.
NOTE: VLS is the VLS of the selected LDG CONF (3 or FULL)

TITLE	The page title displays: - APPR, if the Approach phase is not active or APPR, if the Approach phase is active, and - The identification of the selected approach.
[1L] QNH	This field displays brackets when the aircraft is more than 180 NM from the destination. Inside 180 NM, mandatory amber boxes appear. The flight crew must enter the QNH in hectopascals (hPa) or in inches of mercury (inHg). The value is either entered in hPa or inHg: - For hPa, enter three or four digits, within the allowable range for hPa, or - For inHg, enter the four digits of the desired value with or without a decimal point, within the allowable range for inHg. The system interprets: - 1003 as 1 003 hPa - 2900 as 29.00 inHg - 29.92 as 29.92 inHg. The flight crew can modify this entry at any time. *Note:* *An erroneous entry of an OAT or BARO minimum in QNH field (e.g. 22 °C or 2 200 ft) is accepted by the system. As a consequence, the CPC computes an erroneous cabin pressurization segment during descent, then may trigger a pressurization ECAM alert.*
[2L] TEMP	This field displays the temperature at destination. Until the flight crew enters the temperature, the field displays brackets. The flight crew can modify this figure. The system uses this temperature to refine its computation of the descent profile (ISA model).
[3L] MAG WIND or TRUE WIND	The flight crew enters the wind speed in knots at the destination in this field. The reference of the wind entry is magnetic or true, depending on the airport's reference. The system transmits any entry made in this field to the DESCENT WIND page (which displays wind direction as true, not magnetic, whatever the airport's reference is).
[4L] TRANS ALT	This field displays the transition altitude taken from the database (small font) or entered by the flight crew (large font). The flight crew can modify it at any time.

[5L] VAPP	The FMGEC computes this approach speed, using the formula: VAPP = VLS + 1/3 of the headwind component (1/3 of the headwind component is limited to 5 kt as a minimum and 15 kt as a maximum). The flight crew can modify VAPP. A clear action reverts VAPP to the computed value. _Note:_ *VLS = 1.23 VS1G of the selected landing configuration (FULL or 3).*
[6L] PREV PAGE	This field displays this legend if the approach phase is not active. Pressing this key calls up the PERF DES page.
[1R] FLS/FINAL APP * ◁	This field displays only with the FLS/FINAL APP - Coexistence ◁ . This field enables the flight crew to select FLS or FINAL APP as a guidance mode for the non precision approach selected in the ARRIVAL page. The selected guidance mode is displayed in cyan large font. The other guidance mode is displayed in white small font. If the key is pressed, the CONFIRM FINAL APP or CONFIRM FLS prompt appears. The flight crew must press the key to confirm the choice. _Note:_ *1. FLS is the default mode for non precision approach.* *2. The use of the FINAL APP mode should be restricted to RNAV(RNP) approach.*
[2R] BARO	This field displays: - The MDA with associated brackets, or - The MDH with associated brackets, if the aircraft is equipped with QFE ◁ option. The flight crew inserts the value, which can be modified at any time. If the flight crew makes an entry in [3R] field or changes the approach, it clears this figure. The BARO range is 0 to 5 000 ft above landing elevation.
[3R] RADIO	If the flight plan includes an ILS or GLS ◁ approach, this field displays RADIO and empty brackets. For a CAT II or CAT III approach, the flight crew inserts the decision height. The system will accept an entry of NO, NODH or NO DH. If the flight crew inserts a BARO value in [2R] field, this erases the decision height, and this field reverts to brackets. The RADIO range is 0 to 700 ft.
[4R] Blank or EO CLR	When the flight phase is Approach and an engine-out is active, the EO CLR prompt appears. The flight crew can deactivate the engine-out mode by pressing the key.

[5R] LDG CONF FULL/CONF 3	The flight crew can use this key to select the landing configuration. CONF FULL is the default landing configuration. The selected configuration is displayed in first position. The configuration that is not selected is displayed in second position.
[6R] NEXT PHASE	Pressing this key calls up the PERF GO AROUND page.

TITLE	The page title displays APPR, if the Approach phase is not active or APPR, if the Approach phase is active.

[1L] QNH	This field displays brackets when the aircraft is more than 180 NM from the destination. Inside 180 NM, mandatory amber boxes appear. The flight crew must enter the QNH in hectopascals (hPa) or in inches of mercury (inHg). The value is either entered in hPa or inHg: - For hPa, enter three or four digits within the allowable range for hPa, or - For inHg, enter the two digits of the desired value or two digits followed by a decimal point and two additional digits, within the allowable range for inHg. The system interprets: - 1003 as 1 003 hPa - 29 as 29.00 inHg - 29.92 as 29.92 inHg. The flight crew can modify this entry at any time. Note: *An erroneous entry of an OAT or BARO minimum in QNH field (e.g. 22 °C or 2 200 ft) is accepted by the system. As a consequence, the CPC computes an erroneous cabin pressurization segment during descent, then may trigger a pressurization ECAM alert.*
[2L] TEMP	This field displays the temperature at destination. Until the flight crew enters the temperature, the field displays brackets. The flight crew can modify this figure. The system uses this temperature to refine its computation of the descent profile (ISA model).
[3L] MAG WIND or TRUE WIND	The flight crew enters the wind speed in knots at the destination in this field. The reference of the wind entry is magnetic or true, depending on the airport's reference. The system transmits any entry made in this field to the DESCENT WIND page (which displays wind direction as true, not magnetic, whatever the airport's reference is).
[4L] TRANS ALT	This field displays the transition altitude taken from the database (small font) or entered by the flight crew (large font). The flight crew can modify it at any time.

[5L] VAPP	The FMGEC computes this approach speed, using the formula: VAPP = VLS + 1/3 of the headwind component (1/3 of the headwind component is limited to 5 kt as a minimum and 15 kt as a maximum). The flight crew can modify VAPP. A clear action reverts VAPP to the computed value. *Note:* *VLS = 1.23 VS1G of the selected landing configuration (FULL or 3).*
[6L] PREV PAGE	This field displays this legend if the approach phase is not active. Pressing this key calls up the PERF DES page.
[1R] FINAL	This field displays the approach specified in the flight plan. The flight crew cannot modify it through this field.
[2R] BARO	This field displays: - The MDA with associated brackets, or - The MDH with associated brackets, if the aircraft is equipped with QFE ◁ option. The flight crew inserts the value, which can be modified at any time. If the flight crew makes an entry in [3R] field or changes the approach, it clears this figure. The BARO range is 0 to 5 000 ft above landing elevation.
[3R] RADIO	If the flight plan includes an ILS or GLS ◁ approach, this field displays RADIO and empty brackets. For a CAT II or CAT III approach, the flight crew inserts the decision height. The system will accept an entry of NO, NODH or NO DH. If the flight crew inserts a BARO value in [2R] field, this erases the decision height, and this field reverts to brackets. The RADIO range is 0 to 700 ft.
[4R] LDG CONF CONF 3	The flight crew can select CONF 3 by pressing this key. This moves the * down to the [5R] field, that displays FULL.
[5R] FULL	The flight crew can use this key to select CONF FULL when necessary. CONF FULL is the default landing configuration.
[6R] NEXT PHASE	Pressing this key calls up the PERF GO AROUND page.

```

TITLE	GO AROUND is in large white font, if the go-around phase is not active; it is in large green font, if it is.

[5L] THR RED ACC	This field displays the thrust reduction altitude and the acceleration altitude. Thrust reduction altitude - Altitude at which thrust must be reduced from takeoff/go-around thrust to maximum climb thrust. - LVR CLB flashing on flight mode annunciator. - Defaults to 1 500 ft above destination runway elevation, or to the altitude set by the airline. - Can be modified by the crew (minimum 400 ft above destination runway elevation). Acceleration altitude - Altitude at which target speed jumps to green-dot speed (see the note below). - Defaults to 1 500 ft above destination runway elevation, or to the altitude set by the airline. - Can be modified by the crew but always equal to or higher than thrust reduction altitude.
[6L] PREV PHASE or	This field displays this legend, if the go-around phase is not active. Pressing the key calls up the PERF APPR page.
ACTIVATE APPR PHASE	This field displays this legend, if the go-around phase is active. Pressing it once makes “CONFIRM APPR” appear. A second press activates the approach phase.
[5R] ENG OUT ACC	This display has the same characteristics as the display beside the 5R key on the takeoff page. It is for display only, and the pilot can modify it.
[6R] NEXT PHASE	Pressing this key calls up the PERF APPR page.
[IR] Blank or EO CLR*	This field is normally blank. EO CLR* is displayed when GO AROUND is the active phase and an engine-out condition is detected.

Note: *When the go-around phase is active, if the pilot enables ALTN, or if the pilot inserts a new destination in the active flight plan and a new cruise flight level on the progress page, the go-around phase automatically shifts to the climb phase. (The target speed jumps from green dot speed to initial climb speed).*

PROG PAGES

Ident.: DSC-22_20-50-10-25-00007293.0006001 / 17 NOV 20
Applicable to: LV-GKO, LV-GKP

The progress page is a multifunction page that enables the flight crew to:
- Select a new cruise flight level
- Cross-check the navigation accuracy of the Flight Management (FM) system and validate it
- Update the FM position
- Monitor the descent.

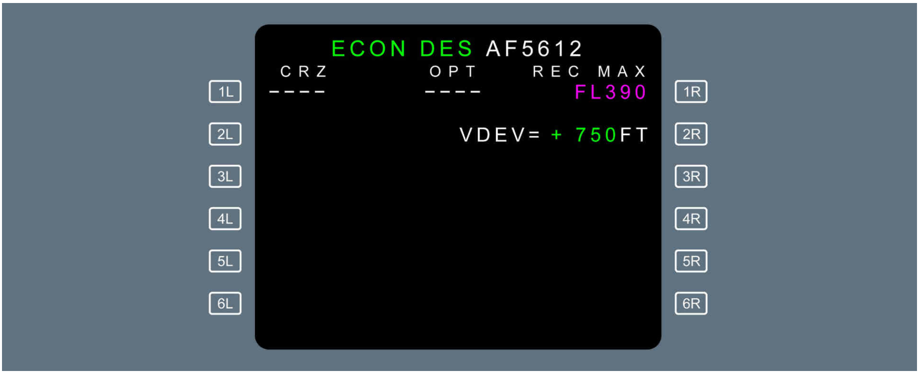
TITLE	The title is different for each flight phase (see illustrations above). The FMS flight phase appears in large green font. The flight number in large white font. EO in amber large font if the engine out is detected.
Line 1 CRZ (blue)	This line displays in blue the cruise flight level inserted on the INIT A page or directly in this field. If the flight crew uses the FCU to select an altitude that is higher than that displayed in this field, the system changes the number displayed in this field to agree. The flight crew cannot insert flight level in this field that is lower than the FCU selected altitude. This field displays dashes when the descent or approach phase is active.

OPT	This field displays the optimum flight level (in green), that is computed based on the current gross weight, cost index, temperature, wind and a minimum estimated cruising time of 15 min. It displays dashes: - In cruise, when the aircraft is less than 15 NM from the Top of Descent - In the descent and approach phases - If an engine-out is detected.
REC MAX	This field displays the recommended maximum altitude (in magenta), that is computed based on the current gross weight and temperature and assuming that the anti-ice is off (if icing conditions are expected, use the performance application of the EFB). It provides the aircraft with a 0.3 g buffet margin, a minimum rate of climb at MAX CL thrust, and level flight at MAX CRZ thrust. This field is limited to FL 410. If one engine is out (or two engines for A340 aircraft only), this field displays the recommended maximum engine-out altitude, that is computed based on the long-range cruise speed and assuming that anti-ice is off. _Note:_ *The REC MAX field may display a value up to FL 415. However, the current aircraft's maximum certified altitude is 41 100 ft. Disregard the OPT MAX value, if it exceeds FL 411.*
[2L] REPORT	This key calls up the REPORT PAGE.
[2R] VDEV	This field is displayed during the descent and approach phases, when NAV mode is engaged, or in HDG mode, provided that the crosstrack error (XTK) is less than 5 NM. It displays the vertical deviation between the aircraft's current altitude and the FMS-computed vertical profile.



Line 3 UPDATE AT	The flight crew can update the FMS position via this field by entering either the IDENT of a waypoint, a NAVAID, an airport, a latitude and longitude, a place/bearing/distance, or a place-bearing/place-bearing.

Line 3 UPDATE AT	When the flight crew has entered this data, this field changes its format to: "CONFIRM UPDATE AT", followed by the latitude/longitude and ident of the inserted position with an asterisk. *Note: If no IDENT has been inserted, the field displays "ENTRY" instead of an IDENT.* The flight crew presses the right-hand key adjacent to the asterisk to confirm the update, when the aircraft overflies the inserted position.

Line 4 BRG/DIST

On this line the flight crew can enter an airport, a waypoint, a NAVAID, or a runway. The flight crew may enter this information as an IDENT, a latitude/longitude, a place/bearing/distance, or a place-bearing/place-bearing (PBX). The field then displays the FMS computed bearing and distance of this bearing from the aircraft's present position. If it does not have an IDENT, the point is called "ENTRY".

Example : BRG/DIST
340 °/95.4 to ENTRY
The line displays a T if the true reference is selected (NORTH REF pushbutton switch).

[5L] PREDICTIVE GPS This field provides access to the PREDICTIVE GPS page.

[5R] GPS PRIMARY ◁	If installed, this field displays GPS PRIMARY when the GPS PRIMARY is available. When GPS PRIMARY is not available, this field is blank. The scratchpad displays “GPS PRIMARY″ when GPS/IRS becomes available or “GPS PRIMARY LOST” when GPS/IRS is no longer available.
[6L] REQUIRED	This field displays the default value for the required navigation accuracy. The flight crew can modify it, as necessary. If the flight crew has not modified this data, the default value changes according to the current flight area (*Refer to DSC-22_20-10 General*).
ACCUR HIGH/LOW	This field displays the navigation accuracy estimated by the FMS. HIGH indicates that the estimated navigation accuracy is high: The ESTIMATED value is less than the REQUIRED value. LOW indicates that the estimated navigation accuracy is low: The ESTIMATED value is greater than the REQUIRED value.
[6R] ESTIMATED	This field displays the current Estimated Position Error value (EPE), as computed by the FMS.

PROG PAGES

Ident.: DSC-22_20-50-10-25-00007293.0025001 / 17 NOV 20
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The progress page is a multifunction page that enables the pilot to:
- Select a new cruise flight level
- Crosscheck the navigation accuracy of the Flight Management (FM) system and validate it
- Update the FM position
- Monitor the descent.

TITLE	Different for each flight phase (see above). The vertical phase is in large green font. The flight number is in large white font. EO is large amber font, if the engine-out condition is detected.
Line 1 CRZ (blue)	This line displays the cruise flight level, inserted on the INIT A page or directly in this field in blue. If the FCU is used to select an altitude that is higher than the one displayed, the system changes the displayed number to match the one selected by the FCU. In this line, the flight crew cannot insert a flight level that is lower than the FCU-selected altitude. This field shows dashes when the descent or approach phase is active.

OPT	This field displays the optimum flight level (in green), that is computed based on the current gross weight, cost index, temperature and wind. This flight level requires a 5 min minimum cruise time at a minimum cruise flight level of FL 100. It displays dashes if an engine-out is detected.
REC MAX	This field displays the recommended maximum altitude (in magenta), that is computed based on the current gross weight and temperature, and assuming that the anti-ice is off (if icing conditions are expected, use the performance application of the EFB). It provides the aircraft with a 0.3 g buffet margin, a minimum rate of climb at MAX CL thrust, and level flight at MAX CRZ thrust. This field is limited to FL 415. If one engine is out (or two engines for A340 aircraft only), this field displays the recommended maximum engine-out altitude, that is computed based on the long-range cruise speed and assuming that anti-ice is off.
[2L] REPORT	This key calls up the REPORT PAGE.
[2R] VDEV	This field is displayed during the descent and approach phases, when NAV mode is engaged, or in HDG mode, provided that the crosstrack error (XTK) is less than 5 NM. It displays the vertical deviation between the aircraft's current altitude and the FMS-computed vertical profile.

[5L] PREDICTIVE GPS ◁	This prompt gives access to the PREDICTIVE GPS page.
[5R] GPS PRIMARY ◁	This prompt is displayed when the FMS navigation mode is GPS PRIMARY. This field is blank, when GPS PRIMARY is unavailable, or the navigation mode is not GPS/IRS. The scratchpad displays the relevant “GPS PRIMARY″ message when this prompt appears, and “GPS PRIMARY LOST” when the field goes blank.
[6L] REQUIRED	This field displays the default value for the required navigation accuracy level. The pilot can modify it. Provided no pilot entry has been made, the default value changes according to the actual flight area (enroute, terminal, approach; *Refer to DSC-22_20-40-10 General*).
ACCUR HIGH/LOW	This field shows the flight management system’s estimate of navigational accuracy. “HIGH” indicates that the FMS estimates that the navigational accuracy matches the accuracy criteria of the currently flown area. “LOW” indicates the criteria is not matched.
[6R] ESTIMATED	This field displays the current estimated navigation accuracy value (EPE), as computed by the FMS.

[1L] DEST	Destination airport as currently selected in active flight plan. Not modifiable. This field shows dashes when no destination airport exists.
[1R] ETA	This field is defaulted to the estimated arrival time as computed by the FMS (blue small font). The pilot may enter a value in this field (blue large font). Amber boxes are displayed when no prediction exist or crew entry has been cleared.
Line 2 PRIMARY Y/N	Predicted primary status at destination airport at the following times: estimated time of arrival ± 5, 10, 15 min. Availability of GPS PRIMARY at corresponding time is indicated by Y when PRIMARY is predicted to be available and by N when GPS PRIMARY is predicted to be unavailable. These fields are blanked when destination [1L] or time [1R] is not defined.
[3L] WPT	The pilot may enter a reference waypoint in this field. Blue brackets are displayed when no entry has been made.

[3R] ETA	When a reference waypoint has been entered in [3L], amber boxes are displayed. The crew is requested to enter a reference time in this field.
Line 4 PRIMARY Y/N	Equivalent information to [2L] / [2R] displayed for any pilot selected waypoint. Corresponding time of arrival is also displayed.
Line 5 DESELECTED SATELLITES and Line 6 SATELLITES	Allow the pilot to deselect up to four satellites by inserting the corresponding satellite number, the number is then displayed in blue large font. When deactivated, the satellites are not considered for predictive GPS availability at destination or at selected waypoint. The deselection is cancelled when the entry is cleared (blue brackets are displayed) or the field is overwritten by a different satellite number.

[3L]-[3R] NEXT (green)	Same information for the next waypoint.
[4L] [4R] SAT/T.WIND/FOB (green)	This field displays the static air temperature, the wind direction and velocity, and the FOB recorded at waypoint sequencing.
[5L] T/D/UTC/DIST (green)	This field displays the estimated time and the distance to go to the next change of the cruise profile (T/D, S/C, S/D). These data are only displayed when the cruise phase is active.
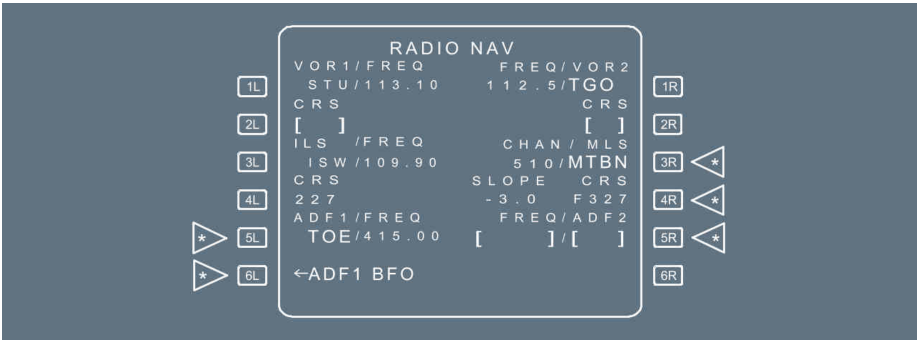
[5R] SEND* ◁✳ (blue)	The crew uses this prompt to downlink a position report. This field may be blanked depending on airline policy, and on ACARS installation.
Line 6 DEST/UTC/DIST/EFOB	This field displays the estimated time of arrival, the distance along the F-PLN and estimated fuel on board (DEST EFOB) at destination. The DEST EFOB field will turn to amber, if the EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page. This display is identical to the information of the F-PLN pages.

Note: *No data can be inserted or modified on the REPORT page.*

RADIO NAV PAGE

Ident.: DSC-22_20-50-10-25-00014467.0001001 / 01 OCT 12
Applicable to: LV-GKO, LV-GKP

This page enables the pilot to select or verify the radio NAVAIDs tuned for display purposes only.
Among these NAVAIDs are VOR, VOR/DME, TAC, VORTAC, and ILS.
If either RMP is set to NAV, this page is blank on both MCDUs.



```
                RADIO NAV
 VOR1/FREQ                FREQ/VOR2
  STU/113.10            112.5/TGO
 CRS                            CRS
 [   ]                        [   ]
 ILS   /FREQ             CHAN/ MLS
  ISW/109.90              510/MTBN
 CRS                    SLOPE   CRS
 227                     -3.0  F327
 ADF1/FREQ                FREQ/ADF2
  TOE/415.00            [      ]/[   ]
 ←ADF1 BFO
```

Line 1 VOR 1/FREQ FREQ/VOR 2	This line displays the identifiers and frequencies of VOR 1 and VOR 2, whether they are automatically or manually-tuned. To manually tune a VOR, the pilot inserts the IDENT or frequency. If the IDENT is not in the database, the new NAVAID page comes up. A “clear” action reverts the selection to the autotuned NAVAID.
Line 2 CRS	This line displays courses for the NAVAIDs on Line 1. The pilot can manually enter the courses via these fields. It displays “T”, if a tuned VOR is true North-referenced.
[3L] ILS/FREQ	This field displays the ILS IDENT and frequency. It is autotuned, if the ILS is associated with the departure runway, or if the flight plan shows an ILS approach selected for the destination. The ILS may also be entered manually. When the manually-entered ILS differs from the autotuned ILS, “RWY–ILS MISMATCH” appears.
[4L] CRS	This field displays the course associated with the ILS on Line 3. It comes up automatically when an ILS is autotuned, or if an ILS has been manually-tuned via its IDENT. Otherwise, the course must be entered manually. The course may be backbeam (Bxxx), or frontbeam (Fxxx). Note: *If the flight crew intends to manually tune an ILS that is not in the Navigation Database or to manually tune an ILS by its frequency (ident not entered), and if they do not enter the course, the flight crew will not be able to arm approach modes.*
[3R] CHAN/MLS ◁	The pilot manually tunes an MLS by its IDENT, or its channel. The system automatically tunes the associated course and slope. Note: *If an MLS is tuned while an ILS was tuned, the ILS is deselected.*

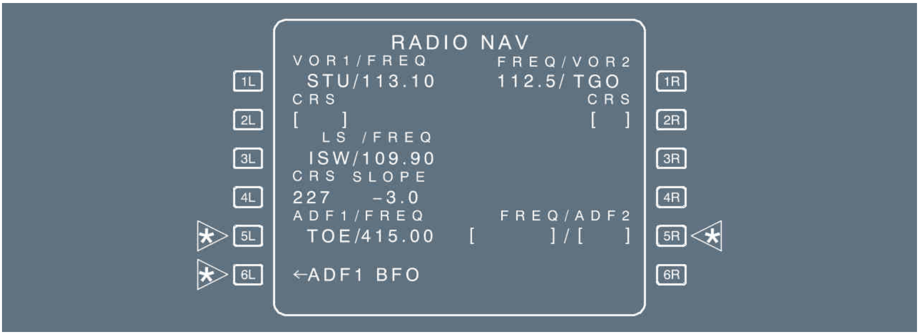
[4R] SLOPE CRS ◁	The pilots enters the slope and the course of the MLS in this field. The course may be backbeam (Bxxx), or frontbeam (Fxxx). The field displays “T”, if the MLS is true North-referenced.
Line 5 ADF 1/FREQ FREQ/ADF 2 ◁	This line displays the identifiers and frequencies of ADFs 1 and 2. The pilot can use the IDENT or the frequency to manually tune the ADF.
[6L] Line 6 ADF 1/BFO BFO/ADF 2 ◁	When an ADF 1 is selected, these fields displays an ADF/BFO prompt. The flight crew presses the key once to erase the arrow and put the ADF in BFO mode. A clear action brings the arrow back and cancels BFO.

<u>Note:</u>
- *The autotune function only works for NAVAIDs stored in the database*
- *When tuning manually, the operator should use the IDENT rather than the frequency, unless the NAVAID is not in the database*
- *Manually tuned frequencies are displayed in large font.*

RADIO NAV PAGE

Ident.: DSC-22_20-50-10-25-00014467.0002001 / 11 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

This page enables the pilot to select or verify the radio NAVAIDs tuned for display purposes only. Among these NAVAIDs are VOR, VOR/DME, TAC, VORTAC, and ILS, GLS ◁ and ADF ◁ . If either RMP is set to NAV, this page is blank on both MCDUs.



```

Line 1 VOR 1/FREQ FREQ/VOR 2	This line displays the identifiers and frequencies of VOR 1 and VOR 2, whether they are automatically or manually-tuned. To manually tune a VOR, the pilot inserts the IDENT or frequency. If the IDENT is not in the database, the new NAVAID page comes up. A “clear” action reverts the selection to the autotuned NAVAID.

Line 2 CRS	This line displays courses for the NAVAIDs on Line 1. The pilot can manually enter the courses via these fields. It displays "T", if a tuned VOR is true North-referenced.
[3L] LS/FREQ	This field displays the LS IDENT and frequency. It is autotuned, if the LS is associated with the departure runway, or if the flight plan contains an LS approach. The flight crew may also manually enter an LS. When a manually-entered LS differs from the autotuned LS, "RWY–LS MISMATCH" appears.
[3R] G/S SELECTED / G/S DESELECTED :	On aircraft equipped with the FLS function, this field displays the status of the G/S selection/deselection of the tuned ILS approach. The [3R] prompt enables the flight crew to deselect the G/S of the tuned ILS approach in order to perform an ILS G/S out approach using the F-G/S and LOC guidance modes: - When the status is G/S SELECTED, the flight crew can deselect the G/S by pressing the DESELECT* prompt - When the status is G/S DESELECTED, the flight crew can re-select the G/S by pressing the SELECT* prompt.
[4L] CRS SLOPE	CRS: This field displays the course associated with the LS displayed in Line 3. It comes up automatically if an LS is autotuned, or if an LS has been manually tuned via its IDENT. Otherwise, the course must be entered manually. The course may be backbeam (Bxxx), or frontbeam (Fxxx). SLOPE: This field displays the slope associated with the LS displayed in Line 3. It comes up automatically if an LS is autotuned for approach, or if an LS has been manually tuned via its IDENT. *Note:* - *The slope does not apply to LOC only, LDA, SDF or Backbeam approaches.* - *The slope field only appears if the GLS and/or MLS function is installed.*
Line 5 ADF 1/FREQ FREQ/ADF 2 ◁	This line displays the identifiers and frequencies of ADFs 1 and 2. The pilot can use the IDENT or the frequency to manually tune the ADF.
[6L] Line 6 ADF 1/BFO BFO/ADF 2 ◁	When an ADF 1 is selected, these fields displays an ADF/BFO prompt. The flight crew presses the key once to erase the arrow and put the ADF in BFO mode. A clear action brings the arrow back and cancels BFO.

Note:
- *The autotune function only works for NAVAIDs stored in the database*
- *When tuning manually, the operator should use the IDENT rather than the frequency, unless the NAVAID is not in the database*
- *Manually tuned frequencies are displayed in large font.*

SECONDARY PAGES

Ident.: DSC-22_20-50-10-25-M-00007338.0001001 / 17 MAR 11
Applicable to: ALL

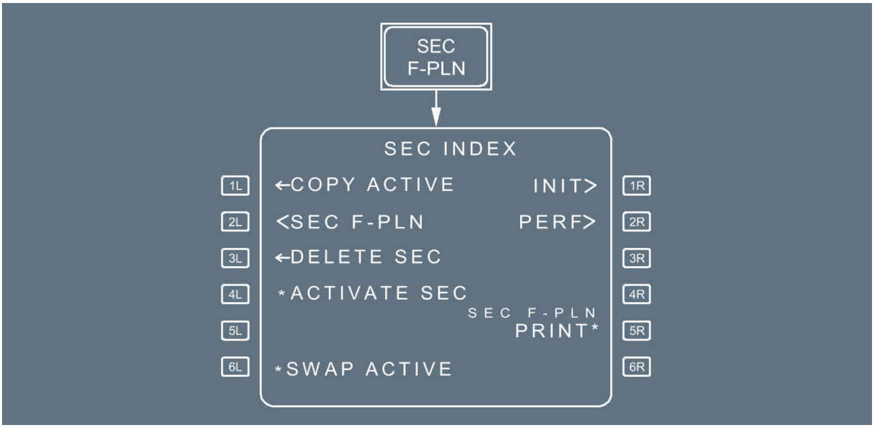
GENERAL

The SEC F-PLN key on the MCDU console allows the flight crew to call up the secondary index page and the secondary flight plan page. The secondary flight plan is generally for a diversion, for predictable runway changes for takeoff or landing, or for training.
There are two types of secondary index pages. The type selected depends on the presence of a secondary flight plan.

Ident.: DSC-22_20-50-10-25-M-00007347.0004001 / 09 DEC 15
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

SECONDARY INDEX PAGE

A SECONDARY FLIGHT PLAN IS ALREADY DEFINED



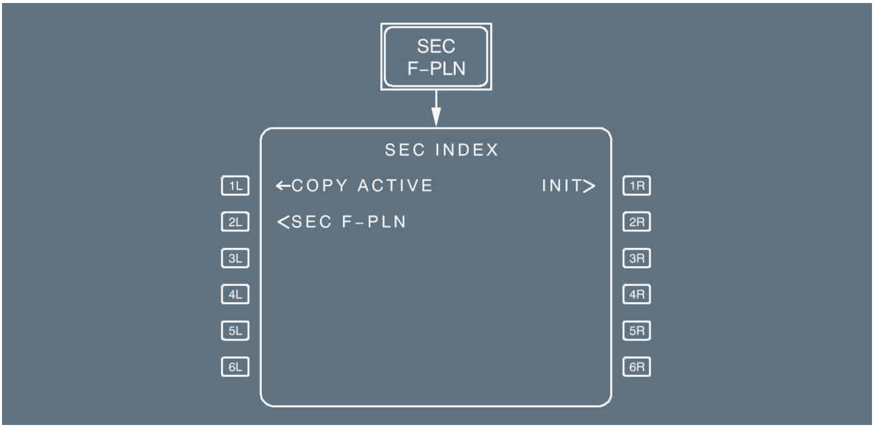
[1L] COPY ACTIVE (blue)	The flight crew presses this key to copy the active flight plan into the secondary flight plan and delete the previous secondary plan.
[2L] SEC F-PLN (white)	The flight crew presses this key to call up the secondary flight plan pages.

[3L] DELETE SEC (blue)	The flight crew presses this key to delete the current secondary flight plan.
[4L] ACTIVATE SEC (amber)	The flight crew presses this key to activate the secondary flight plan as the active flight plan.

Note: *"ACTIVATE SEC" appears routinely if the HDG/TRK mode is active. If the NAV mode is active, "ACTIVATE SEC" appears only if the active and secondary flight plans have a common active leg.*

[6L] SWAP ACTIVE (amber)	The flight crew presses this key to swap the active flight plan and the secondary flight plan: - the active flight plan becomes the secondary flight plan, and - the secondary flight plan becomes the active flight plan. When NAV mode is engaged, the function is only available if the current leg of the active flight plan is identical to its associated leg in the secondary flight plan.
[1R] INIT (white)	The flight crew presses this key to call up the SEC INIT A page.
[2R] PERF (white)	The flight crew presses this key to call up the performance pages for the secondary flight plan.
[5R] SEC F-PLN PRINT	The flight crew presses this key to print the secondary flight plan report.

A SECONDARY FLIGHT PLAN IS NOT DEFINED



[1L] COPY ACTIVE (blue)	The flight crew presses this key to copy the active flight plan into the secondary flight plan.
[2L] SEC F-PLN (white)	The flight crew presses this key to call up the secondary flight plan pages.
[1R] INIT (white)	The flight crew presses this key to call up the secondary INIT page. It is similar to the active INIT page, but blue brackets replace all the amber boxes.

Ident.: DSC-22_20-50-10-25-M-00007347.0001001 / 01 OCT 12
Applicable to: LV-GKO, LV-GKP

Applicable to: LV-GKO, LV-GKP

SECONDARY FLIGHT PLAN PAGES

The secondary flight plan A and B pages are identical to those of the active flight plan.
They are sequenced automatically only when the secondary flight plan is copied from the primary flight plan and when their active legs are identical.
Pages for the active and secondary flight plans differ from each other as follows :

Secondary lateral revision pages :

- ERASE and INSERT are not displayed.
- OFFSET and FIX INFO are not available.
- A lateral revision of the secondary flight plan does not create a temporary flight plan : All revisions are directly applied to the secondary flight plan.

Secondary vertical revision pages :

- A vertical revision on the secondary flight plan does not create a temporary flight plan.

Secondary step altitude pages

- These pages operate as the primary STEP ALTS page, except that optimal step, savings are not available.

Secondary INIT A and B pages :

- They use blue brackets instead of amber boxes.
- They have no align or realign prompt.
- They do not provide for slewing or entering data in the 4L-4R fields (airport reference)

Secondary wind pages :

- They have no history wind page.

Secondary performance pages :

- All boxes are replaced by blue brackets
- They have no engine out mode, no engine out long range cruise cost index.
- They have no expedite predictions
- They have no ACTIVATE/CONFIRM APPROACH PHASE prompt
- They have no PRED TO ALTN predictions on the PERF CLB and PERF DES pages.
- They have no derated climb ◁* thrust selection on the PERF CLB page
- They have no engine out drift down, no top of descent, no cabin descent rate information on the PERF CRZ page.

The secondary flight plan has no FUEL PRED page.

The secondary INIT A page is also used to request or display an uplink INIT message received after engine start.

This uplink INIT message can be cleared or inserted as SECONDARY INIT data.

BACK UP NAV PAGES

Applicable to: ALL

Ident.: DSC-22_20-50-10-25-N-00007385.0001001 / 21 MAR 17

GENERAL

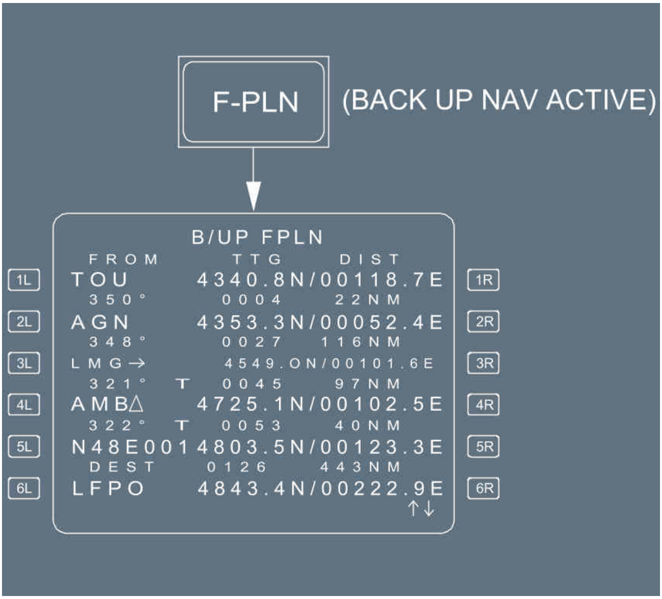
The MCDU features a back up navigation function which provides simplified IRS based navigation in case of a dual FM failure.
BACK UP NAV pages display the data related to the BACK UP NAV function.
During FM normal operation, the F-PLN is continuously downloaded in the MCDU memory: the BACK UP NAV function links the MCDU of the failed FM to its onside IRS.
All navigation data related to the MCDU F-PLN are displayed on the associated ND.
BACK UP NAV function is activated on the MCDU MENU page by depressing the NAV B/UP prompt.
The MCDU back-up F-PLN may accept a maximum of 150 waypoints. It displays only point to point F-PLN (radial, pattern, heading leg... cannot be part of the MCDU F-PLN).
No secondary or temporary F-PLN exists.

These are five pages available while BACK UP NAV is active :
- B/UP F-PLN
- B/UP F-PLN for DIRECT TO
- B/UP PROG
- B/UP IRS for onside IRS (1 or 2)
- B/UP IRS3
- B/UP GPS ◁

Ident.: DSC-22_20-50-10-25-N-00007386.0001001 / 16 MAR 11

B/UP F-PLN PAGE

The B/UP F-PLN page displays the MCDU F-PLN data. The pilot calls up this page by pressing the F-PLN key while B/UP NAV is active.



```
             B/UP FPLN
  FROM          TTG       DIST
TOU         4340.8N/00118.7E
  350°         0004       22NM

  321°   T     0045       97NM
AMB△        4725.1N/00102.5E
  322°   T     0053       40NM
N48E0014803.5N/00123.3E
  DEST         0126      443NM
LFPO        4843.4N/00222.9E
                            ↑↓
```

TITLE	B/UP F-PLN is displayed in a white large font

line 1 to line 5	Display consecutive waypoints with their associated latitude/longitude. If a waypoint is to be overflown, an overfly symbol (△) is displayed after the identifier. If a turn is specified into the next leg, a large font arrow is displayed after the identifier. Label lines contain the bearing, time to go and distance to the next waypoint displayed in small font.

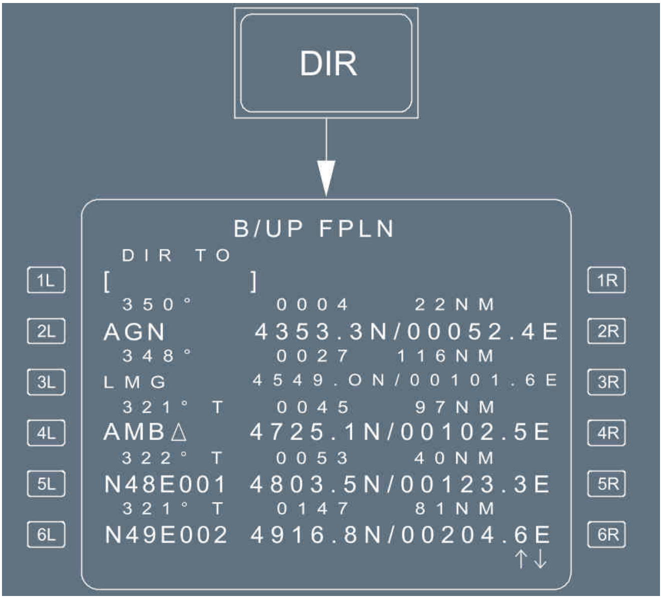
white	bearing
green	time to go and distance
BRG	Between FROM and TO waypoints : True or Mag depending on the TRUE pushbutton position. T is displayed when the bearing is true referenced. Between other waypoints : out bound true track of the great circle joining the 2 related waypoints, independant of TRUE pushbutton switch.
TTG	HHMM limited to 9959. Time between the 2 related waypoints.
DIST	NM limited to 9999.

line 6 DEST	DEST airport identifier and associated latitude/longitude. DIST to destination is computed as the direct distance from the aircraft to the active waypoint plus the along flight plan distances. time to go to destination is computed as distance to destination divided by ground speed. TTG and DEST are dashed if aircraft position is unavailable.

Ident.: DSC-22_20-50-10-25-N-00007387.0001001 / 16 MAR 11

B/UP F-PLN (DIR TO) PAGE

The pilot calls up this page using the DIR key on MCDU while BACK UP NAV is active and aircraft position is valid.



```
            B/UP FPLN
 DIR TO
[          ]

TITLE	B/UP PROG is displayed in a white large font.
line 1 OVHD/ALT	Displays the identifier of the last sequenced waypoint and the altitude at the time of the sequence.

line 2 BRG/DIST/TTG/TO	Allows the pilot to enter an existing MCDU F-PLN waypoint identifier or LAT/LONG or IDENT/LAT/LONG. MCDU then computes bearing, distance and time to go to that waypoint from the present position. The pilot may modify or clear this entry (2R field). BRG : True or magnetic outbound track of the great circle joining aircraft present position to the entered waypoint: dependent on the TRUE pushbutton switch position. DIST : limited to 9999. TTG : HHMM limited to 9959. time to go to the entered position computed assuming current ground speed. These fields are displayed in a green small font. They are dashed if present position is unavailable.
[3L]	Means of navigation used by the Back-Up Navigation. If GPS is fitted and is the navigation source, “GPS NAV” is displayed, otherwise “IRS ONLY NAV” is displayed. If the GPS is not installed, this field is blank.
[4L] IRS 1 (2 or 3) BASED POS GPIRS 1 (2 or 3) (green)	Current aircraft position provided by the selected IRS GPIRS IRS 1 (or 3 if IRS 1 failed) on MCDU 1 IRS 2 (or 3 if IRS 2 failed) on MCDU 2 GPIRS 1 (or GPIRS 3) or MCDU 1 GPIRS 2 (or GPIRS 3) or MCDU 2
[4R] GS (green)	Current ground speed from the selected IRS or GPS.
[5L] DTRK/TRK (green)	Desired track of the MCDU F-PLN active leg and current aircraft track from the selected IRS/GPS (True or MAG). These tracks are true or magnetic depending on TRUE pushbutton position.
[6L] IRS 1 (2)	Gives access to onside B/UP IRS (1 or 2) page
[6R] GPS	Gives access to B/UP GPS page.

B/UP IRS 1 OR 2 OR 3 PAGE

Display IRS 1, 2, 3 navigation data.
The pilot calls up this page from B/UP PROG page, by pressing the corresponding prompt.

TITLE	B/UP IRS 1, 2, 3 displayed in a white large font.
[1L] POSITION	Current aircraft position from selected IRS
[2L] T TRK	True track
[2R] GS	Ground speed
[3L] T HDG	True heading
[3R] M HDG	Magnetic heading Dashed when in polar area.

[4L] WIND	Wind direction and velocity Wind direction is always true referenced.
[4R] GPIRS ACCUR	GPS accuracy in meters as in the IRS page.
[5R] GPIRS POSITION	If GPS is installed, the GPS IRS position is provided as in the IRS page.
[6L] RETURN	Gives access to B/UP PROG page
[6R] NEXT IRS	Gives access to the next IRS page. (Closed loop 1 → 2 → 3 → 1)

This page is not modifiable by the crew.

TITLE		B/UP GPS 1, 2 displayed in a white large font.
[1L]		GPS POSITION
Line 2	:	TTRK GPIRS position (latitude/longitude) UTC: Time GS: Ground Speed

Line 3 : MERIT: GPS figure of merit
GPS ALT: GPS altitude
MODE/SAT: Navigation mode and number of tracked satellites. These values are displayed as in the FM GPS page.

[5R] DESELECT/SELECT GPS: The pilot may select and deselect the GPS for navigation Backup function. The default configuration is GPS selected.

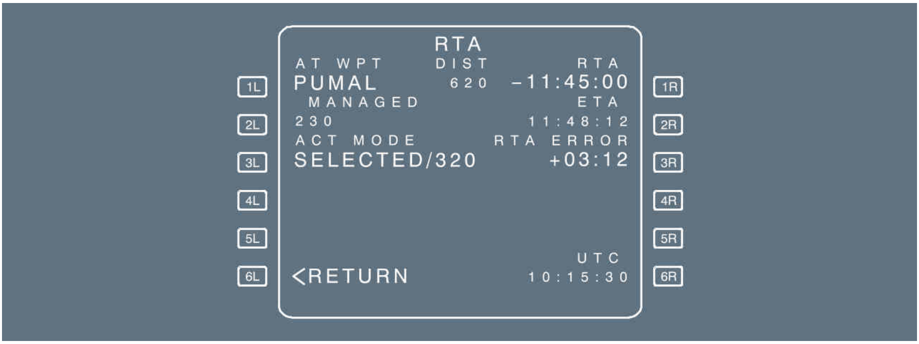
RTA PAGE

Ident.: DSC-22_20-50-10-25-00007390.0003001 / 01 OCT 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The Required Time of Arrival (RTA) page allows the entry and display of a waypoint identifier with associated time constraints.

The page also displays the entered or computed Estimated Takeoff Time (ETT) as well as the following data :
- Predicted ETA at the time-constrained waypoint
- Performance adjusted SPD target
- Time error
- Distance to time constrained waypoint
- Active speed mode

The flight crew calls up this page with the RTA prompt from the vertical revision page.



```
                     RTA
 AT WPT             DIST            RTA
PUMAL                620     -11:45:00
  MANAGED                           ETA
230                           11:48:12
ACT MODE                    RTA ERROR
SELECTED/320                   +03:12

                                    UTC
<RETURN                       10:15:30
```

TITLE RTA (large white font)

line 1	This line displays - AT WPT, DIST and RTA when a time constraint can be defined. The identifier of the revised waypoint or the first following waypoint at which the time constraint can be defined, is displayed by default in small blue font - AT WPT, DIST and RTA when a time constraint has already been defined. The associated constrained waypoint identifier is displayed by default in large blue font - AT WPT and white dashes when no time constraint can be defined - AT WPT and blue brackets if a time constraint can only be introduced before the waypoint at which the VERT REV has been initiated. Only when the waypoint identifier has been defined (by the flight crew or by default), blue brackets and a blue start are displayed in [1R] field. The flight crew enters the time constraint as “HHMMSS”, preceded by: “–“ sign for “at or before” “+” sign for “at or after” no sign for “at”.
[2L] MANAGED	This field displays the FMGES-computed ECON speed/Mach (*Refer to DSC-22_20-40-10 Optimization*)
[3L] ACT MODE	This field displays the active speed mode: MANAGED or SELECTED/NNN (NNN is the target speed). The pilot cannot modify it through this field.
[6L] RETURN	The pilot presses this key to revert the display to the VERT REV page.
[2R] ETA	When a required time at arrival has been defined, the 2R field displays the estimated time of arrival as “HHMMSS”.
[3R] RTA ERROR	This field is blank when the RTA is predicted as made. If the RTA is predicted as missed, “RTA ERROR” is displayed in small white font, and the time error between ETA and RTA is displayed in small amber font.
[6R] ETT	The Estimated Takeoff Time (ETT) field is available in the preflight phase. If no ETT is available, the 6R field displays blue brackets and a blue star. Once available, the ETT is displayed in magenta.
UTC	Universal time is displayed in green for takeoff, climb, cruise, descent and approach phases.

RTA PAGE

Ident.: DSC-22_20-50-10-25-00007390.0001001 / 01 OCT 12

TITLE	RTA (large white font)

line 1	This line displays AT and blue brackets, if no time constraints exist, or AT, DIST and RTA when a time constraint has been defined. The waypoint identifier is displayed in large blue font. If only the waypoint identifier has been defined, blue brackets and a blue star are displayed facing the 1R prompt. The pilot enters the time constraint as “HHMMSS”, preceeded by : – for at or before ; + for at or after ; no sign for at.
[2L] MANAGED	This field displays the FMGES-computed ECON speed/Mach (*Refer to DSC-22_20-10 General*)
[3L] ACT MODE	This field displays the active speed mode : MANAGED or SELECTED/NNN (NNN is the target speed). The pilot cannot modify it through this field.
[6L] RETURN	The pilot presses this key to revert the display to the VERT REV page.
[2R] ETA	When a required time at arrival has been defined, the 2R field displays the estimated time of arrival as “HHMMSS”.
[3R] RTA ERROR	This field is blank when the RTA is predicted as made. If the RTA is predicted as missed, “RTA ERROR” is displayed in small white font, and the time error between ETA and RTA is displayed in small amber font.
[6R] ETT	The Estimated Takeoff Time (ETT) field is available in the preflight phase. If no ETT is available, the 6R field displays blue brackets and a blue star. Once available, the ETT is displayed in magenta.
UTC	Universal time is displayed in green for takeoff, climb, cruise, descent and approach phases.

Intentionally left blank

GENERAL

Ident.: DSC-22_20-50-20-00026040.0001001 / 03 NOV 23
Applicable to: ALL

Two types of MCDU messages exist:
- Type I: Direct result of a flight crew action
- Type II: Information about a situation, or an action request to the flight crew.

Type II messages are stored in a first-in/first-out message queue (5 messages maximum).
They are suppressed, if correct data is entered, or when they no longer apply.
The flight crew can clear all messages by pressing the CLR key on the MCDU console.

A/C POSITION INVALID

Ident.: DSC-22_20-50-20-00026041.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The aircraft position is no longer valid. If the flight crew clears the message, the message appears again if the flight crew displays the HOLD at PPOS or the DIR TO page.

ALIGN IRS

Ident.: DSC-22_20-50-20-00026044.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	At least one IRS waits for an alignment position. The flight crew should initiate the alignment via the IRS INIT page in the MCDU.

ALT CSTR ABOVE CRZ FL

Ident.: DSC-22_20-50-20-00026045.0003001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU
Display Conditions	A flight plan altitude constraint is disregarded because it is above the cruise altitude or a descent step altitude. The message is displayed upon one of the following conditions: - The flight crew modifies the current cruise altitude or enters a new one, or - The flight crew modifies, deletes or creates a descent step altitude, or - The flight crew activates the SEC F-PLN.

AOC XXX F-PLN UPLINK

Ident.: DSC-22_20-50-20-00026452.0005001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	A F-PLN uplink is inserted in the active or secondary F-PLN. XXX corresponds either to ACT for the active F-PLN, or to SEC for the secondary F-PLN.

AREA RNP IS XX.XX

Ident.: DSC-22_20-50-20-00026048.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew entered an RNP value on the PROG page, and the following conditions are applicable: - The manually entered value is more than the default RNP value of the current flight phase - There is no RNP value defined in the navigation database for the active flight leg or route. XX.XX is the current RNP value.

AWY/WPT MISMATCH

Ident.: DSC-22_20-50-20-00026049.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew enters an airway ident in the VIA field on the AIRWAYS page, but it does not contain the revised point. If the flight crew enters a second airway ident, it must contain the first airway ending point.

BLOCK IGNORES RTA

Ident.: DSC-22_20-50-20-00026050.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The fuel planning function ignores one of the following: - A time constraint that exists at initialization of the F-PLN, or - The entry of a time constraint made after the initialization of the F-PLN.

CABIN RATE EXCEEDED

Ident.: DSC-22_20-50-20-00026051.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The aircraft is in the cruise phase, at less than 200 NM from the destination, and the cabin rate, that is associated with the theoretical descent profile, is more than the maximum cabin rate. The flight crew can check or change the maximum cabin rate on the PERF CRZ page.

CHECK ALTN WIND

Ident.: DSC-22_20-50-20-00026479.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS receives a wind data uplink associated with an alternate cruise flight level via uplink that is different from the current FMS alternate cruise flight level.

CHECK APPR SELECTION

Ident.: DSC-22_20-50-20-00026054.0008001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU and PFD
Display Conditions	The flight crew manually tuned an ILS/GLS approach on the RADIO NAV page. This manually-tuned landing system does not correspond to the approach that is selected in the F-PLN. The message appears only when the aircraft is: - In cruise, and at less than 100 NM from the T/D, or - In descent, or - In approach, and the altitude is above 700 ft. In approach, pressing the APPR pb arms LOC and G/S modes on the manually-tuned landing system.

CHECK APPR SELECTION

Ident.: DSC-22_20-50-20-00026054.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU and PFD
Display Conditions	The flight crew manually tuned an ILS/GLS approach on the RADIO NAV page. This manually-tuned landing system does not correspond to the approach that is selected in the F-PLN. The message appears only when the aircraft is: - In cruise, and at less than 100 NM from the T/D, or - In descent, or - In approach, and the altitude is above 800 ft. In approach, pressing the APPR pb arms APP NAV and FINAL modes.

CHECK CO RTE

Ident.: DSC-22_20-50-20-00026457.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS receives a F-PLN uplink with a company route ident that is different from the company route ident specified in the F-PLN request.

CHECK DATA BASE CYCLE

Ident.: DSC-22_20-50-20-00026055.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The current date disagrees with the validity period of the active navigation database. This message appears when the flight crew enters a FROM/TO airport or a company route.

CHECK DEST DATA

Ident.: DSC-22_20-50-20-00026476.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The aircraft is in cruise phase and at less than 180 NM from its destination and one of the following conditions occur: - QNH, TEMP, or WIND data are received via a PERF APPR uplink, or - A descent wind uplink is received and creates a conflict with the QNH, TEMP or WIND data already displayed on the PERF APPR page.

CHECK FLT NBR

Ident.: DSC-22_20-50-20-00026458.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS receives a flight number via uplink that is different from the flight number specified in the F-PLN request.

CHECK IRS 1(2)(3)/FM POSITION

Ident.: DSC-22_20-50-20-00026057.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The difference between the ADIRS alignment position and the FMS position is more than a threshold that is a function of time.

CHECK IRS/AIRPORT POS

Ident.: DSC-22_20-50-20-00026229.0001001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The difference between the ADIRS alignment position and the airport position is 5 NM or more.

CHECK WEIGHT

Ident.: DSC-22_20-50-20-00026059.0020001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU
Display Conditions	Before engine start: The flight crew activates the SEC F-PLN, and the secondary ZFW/ZFWCG differs from the active ZFW/ZFWCG. After engine start: One of the following conditions occurs: - The difference between the FMS GW and FAC GW is more than 7 t, or - The flight crew activates the SEC F-PLN, and the difference between the ZFW/ZFWCG from SEC INIT FUEL PRED page and from FUEL PRED page is more than 5 t.

CHECK WEIGHT

Ident.: DSC-22_20-50-20-00026059.0011001 / 03 NOV 23
Applicable to: LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	Before engine start: The flight crew activates the SEC F-PLN, and the secondary ZFW/ZFWCG differs from the active ZFW/ZFWCG. After engine start: One of the following conditions occurs: - The difference between the FMS GW and FAC GW is more than 7 t, or - The flight crew activates the SEC F-PLN, and the difference between the ZFW/ZFWCG from SEC INIT B page and from FUEL PRED page is more than 5 t.

CHECK WEIGHT

Ident.: DSC-22_20-50-20-00026059.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP

Message Type	II
Display Type	MCDU
Display Conditions	The difference between the FMS GW and the FAC GW is more than 7 t.

CHECK MIN DEST FOB

Ident.: DSC-22_20-50-20-00026060.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew manually enters the MIN DEST FOB value, which is below the ALTN + FINAL value.

CHECK NORTH REF

Ident.: DSC-22_20-50-20-00026231.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU and ND
Display Conditions	The position of the NORTH REF pb-sw disagrees with the airport north reference, which is stored in the FMS navigation database. This message appears either for the departure airport (in preflight), or for the destination airport (in arrival or approach).

CHECK ONSIDE P/N

Ident.: DSC-22_20-50-20-00026232.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The part numbers of the FMCs are not compatible. The MCDU automatically displays the P/N STATUS page.

CHECK QFE

Ident.: DSC-22_20-50-20-00026063.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The QFE height and the predicted aircraft altitude differ by more than 100 ft. For this computation, the FMS uses the QNH entry of the PERF APPR page, and the destination airport elevation from the navigation database. This message appears, in descent or approach, when the flight crew changes the barometric reference from QNH(STD) to QFE.

CHECK TAKE OFF DATA

Ident.: DSC-22_20-50-20-00026233.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew already entered the takeoff speeds, and changes the takeoff runway, the flaps setting, or the takeoff shift, the FLEX TO temperature or the Derated Level ◁ .

CLK IS TAKE OFF TIME

Ident.: DSC-22_20-50-20-00026065.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The clock time passed the ETT (either entered by the flight crew or computed by the system).

CLOCK/GPS TIME DIFF

Ident.: DSC-22_20-50-20-00026234.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The difference between the aircraft clock time and the GPS time is more than 3 min.

CLOSE RTE REQ FIRST

Ident.: DSC-22_20-50-20-00026483.0007001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew requests an ATC F-PLN for a second time, and the flight crew did not close, nor cancel the first ATC F-PLN request on the DCDU within the two minutes delay period.

CROSSLOAD ABORTED

Ident.: DSC-22_20-50-20-00026070.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	An error of transmission from one FMS to another occurs.

CROSSLOAD COMPLETE

Ident.: DSC-22_20-50-20-00026071.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The database crossload from one FMS to another is successfully completed.

CRZ FL ABOVE MAX FL

Ident.: DSC-22_20-50-20-00026072.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew enters a flight level that is above the recommended maximum flight level.

CSTR DEL ABOVE CRZ FL

Ident.: DSC-22_20-50-20-00026073.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	A F-PLN altitude constraint is deleted because it is at or above the cruise altitude or a step altitude. The message is displayed when one of the following conditions occurs: - The flight crew modifies the current cruise altitude or enters a new one, or - The flight crew modifies, deletes or creates a step altitude.

CSTR DEL UP TO XXXXXXX

Ident.: DSC-22_20-50-20-00026074.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight phase changes from the cruise / descent / approach phase to the go-around phase. As a result, all altitude and speed constraints between the aircraft and the destination airport are automatically deleted. XXXXXXX corresponds to the ident of the waypoint that is after the last down-path waypoint with a descent altitude or speed constraint.

DATABASE CODING ERROR

Ident.: DSC-22_20-50-20-00026235.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS does not recognize an element from the navigation database, nor an element inserted by the flight crew in the F-PLN.

DECELERATE

Ident.: DSC-22_20-50-20-00026236.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU and PFD
Display Conditions	The managed speed/Mach control is engaged, the aircraft reaches the T/D, and the FMS does not switch to the descent phase.

DELETING OFFSET

Ident.: DSC-22_20-50-20-00026079.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The system automatically deletes an offset when: - The distance remaining to the end of the offset is too short to be flown, or - The ALTN F-PLN is activated, or - Both the start and end waypoints of the offset are deleted, or - A DIR TO, DIR TO/ABEAM, or DIR TO/INTCPT is inserted beyond the start waypoint.

DELETING OFFSET

Ident.: DSC-22_20-50-20-00026079.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP

Message Type	II
Display Type	MCDU
Display Conditions	The system automatically deletes an offset when: - An offset is no longer compatible with the active lateral F-PLN, or - A lateral revision occurs, or - The distance remaining to the end of the offset is too short to be flown.

DELETING SEC OFFSET

Ident.: DSC-22_20-50-20-00026080.0005001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The system automatically deletes a secondary offset when: - The distance remaining to the end of the offset is too short to be flown, or - An ATC F-PLN request is performed.

DEST EFOB BELOW MIN

Ident.: DSC-22_20-50-20-00026081.0004001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU
Display Conditions	The EFOB at the destination airport of the active F-PLN is below the specified minimum fuel at destination, for more than 2 min. This message appears, only if one of the following applies: - The aircraft is in the approach phase and is above 800 ft AGL, or - The aircraft is in the go-around phase and is above 800 ft AGL, or - The ALT mode is engaged for more than 10 min, or - The aircraft is in the cruise or descent phase.

DEST EFOB BELOW MIN

Ident.: DSC-22_20-50-20-00026081.0001001 / 03 NOV 23
Applicable to: LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The EFOB at the destination airport of the active F-PLN is below the specified minimum fuel at destination, for more than 2 min. This message appears, only if one of the following applies: - The aircraft is in the takeoff phase and is above 800 ft AGL, or - The aircraft is in the approach phase and is above 800 ft AGL, or - The aircraft is in the go-around phase and is above 800 ft AGL, or - The ALT mode is engaged for more than 10 min, or - The aircraft is in the cruise or descent phase.

DEST/ALTN MISMATCH

Ident.: DSC-22_20-50-20-00026082.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew enters a company alternate route, and the departure airport of the company alternate route disagrees with the destination airport of the F-PLN.

DIR TO IN PROCESS

Ident.: DSC-22_20-50-20-00026083.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew requests the display of the vertical or lateral revision page on one MCDU, while the other MCDU displays the DIR TO page.

ENTER DEST DATA

Ident.: DSC-22_20-50-20-00026084.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	All of the following occur: - The flight crew did not enter one or more of the destination data (QNH, OAT, or wind) - The flight phase is: - The cruise phase, and the aircraft is at less than 180 NM from the destination, or - The descent phase, or - The approach phase.

ENTRY OUT OF RANGE

Ident.: DSC-22_20-50-20-00026085.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew enters a value that is not within the acceptable range of the data.

EXTEND SPD BRK

Ident.: DSC-22_20-50-20-00026238.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU and PFD
Display Conditions	DES is engaged or FINAL APP is engaged except in CONF 3 or FULL, and the flight crew should extend the speed brakes to comply with an altitude constraint, a speed limit or a speed constraint.

F-G/S BASED ON ISA

Ident.: DSC-22_20-50-20-00026086.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The computation of the F-G/S deviation is based on the ISA temperature at destination, and not corrected with the current temperature at destination. The message appears when all of the following occur: - The FLS guidance is selected - The flight crew did not enter the temperature at destination (OAT) on the PERF APPR page - The LS pb is pressed on the EFIS control panel - The descent or the approach phase is activated.

F-PLN DATALINK IN PROG

Ident.: DSC-22_20-50-20-00026455.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew attempts to modify the F-PLN before the uplink of a F-PLN INIT is complete.

F-PLN ELEMENT RETAINED

Ident.: DSC-22_20-50-20-00026268.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew attempts to delete flight crew-stored navaids, waypoints or runways that are currently used by the FMS. The message informs the flight crew that the elements that are still used by the FMS are not deleted.

F-PLN FULL

Ident.: DSC-22_20-50-20-00026089.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The F-PLN data memory is exceeded.

F-PLN UPLINK -XX REJ

Ident.: DSC-22_20-50-20-00026487.0002001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS rejects XX elements of the ATC F-PLN. XX corresponds to the number of elements rejected by the FMS. The ATC REJ INFO page displays the rejected elements.

FLS ◁ SEL: UPDATE MINIMA

Ident.: DSC-22_20-50-20-00026301.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew deselects the SLS ◁ in RADIO NAV page and the guidance mode reverts to FLS ◁ . LP or LPV minima can no longer be used. The flight crew should modify the approach minima to LNAV/VNAV or LNAV, if available, or select another adequate approach.

FLT NBR UPLINK

Ident.: DSC-22_20-50-20-00026459.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS receives a flight number not requested by the flight crew as part of the F-PLN data uplink.

FM DATALINK UNAVAIL

Ident.: DSC-22_20-50-20-00026484.0002001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The communication between the ATSU and both FMS is not available.

FMS SETTING SPD/RTA

Ident.: DSC-22_20-50-20-00026091.0003001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU
Display Conditions	The system updates the managed speed target to satisfy the RTA constraints. The managed speed target is frozen during the update.

FMS1/FMS2 A/C STS DIFF

Ident.: DSC-22_20-50-20-00026093.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	At power-up, the critical aircraft status data is not identical between FMS1 and FMS2. The critical aircraft status data is: - Navigation database - Performance database - Magnetic variation database - AMI file - FM operational program - Aircraft and airline program pins.

FMS1/FMS2 GW DIFF

Ident.: DSC-22_20-50-20-00026095.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The difference between the FMS1 GW and the FMS2 GW is 1.5 t or more.

FMS1/FMS2 PGM PIN DIFF

Ident.: DSC-22_20-50-20-00026096.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The program pins are not identical between FMS1 and FMS2.

FMS1/FMS2 POS DIFF

Ident.: DSC-22_20-50-20-00026094.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The difference between the FMS1 position and the FMS2 position is 0.5 NM or more. It is 5 NM when the GPS is not installed.

FMS1/FMS2 SPD TGT DIFF

Ident.: DSC-22_20-50-20-00026097.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The difference between the FMS1 speed target and the FMS2 speed target is 5 kt or more.

FORMAT ERROR

Ident.: DSC-22_20-50-20-00026098.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The format of the value, entered by the flight crew, is not correct (*Refer to DSC-22_20-50-30 MCDU Data Format List*).

GPS ◁ IS DESELECTED

Ident.: DSC-22_20-50-20-00026101.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew manually deselected the GPS, and: - The aircraft is at 80 NM from the T/D, or - The aircraft is in the approach phase.

GPS PRIMARY ◁

Ident.: DSC-22_20-50-20-00026102.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU and ND
Display Conditions	For the computation of the aircraft position, at least one of the following conditions was no longer achieved, and both conditions are now achieved again: - The navigation mode is IRS/GPS - The navigation accuracy is HIGH.

GPS PRIMARY ◁ LOST

Ident.: DSC-22_20-50-20-00026103.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU and ND
Display Conditions	For the computation of the aircraft position, at least one of the following conditions is applicable: - The navigation mode is not IRS/GPS - The navigation accuracy is not HIGH.

INDEPENDENT OPERATION

Ident.: DSC-22_20-50-20-00026104.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	FMS1 and FMS2 operate in independent mode (*Refer to DSC-22_10-30 Independent Mode*).

INITIALIZE ZFW/ZFWCG

Ident.: DSC-22_20-50-20-00026299.0001001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	At engine start, the flight crew has not entered a ZFW or ZFWCG value on the INIT B/INIT FUEL PRED page. The flight crew can enter the ZFW or ZFWCG on the FUEL PRED page to clear the message, since the INIT B/INIT FUEL PRED page is no longer accessible.

INVALID ATC UPLINK

Ident.: DSC-22_20-50-20-00026485.0002001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS rejects an ATC F-PLN uplink because it is invalid.

INVALID F-PLN UPLINK

Ident.: DSC-22_20-50-20-00026454.0002001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS rejects a F-PLN uplink because it is not valid.

INVALID FLT NBR UPLINK

Ident.: DSC-22_20-50-20-00026460.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS rejects a flight number that is part of the F-PLN data uplink because it is not valid.

INVALID PERF UPLINK

Ident.: DSC-22_20-50-20-00026464.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS rejects a performance initialization uplink because it is not valid.

INVALID TAKEOFF UPLINK

Ident.: DSC-22_20-50-20-00026469.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS rejects a takeoff data uplink because it is not valid.

INVALID WIND UPLINK

Ident.: DSC-22_20-50-20-00026472.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS rejects a wind data uplink because it is not valid.

LARGE NDB NOT ALLOWED

Ident.: DSC-22_20-50-20-00026109.0003001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU
Display Conditions	Then navigation database, that is loaded, is larger than the size supported by the FMS. The FMS is locked at power-up. The MCDU remains locked on the P/N STATUS page or the AIRCRAFT STATUS page with the following displays: - LARGE NDB NOT ALLOWED on the MCDU scratchpad - INCOMPLETE on the P/N line (on the P/N STATUS page).

LAT DISCONT HEAD

Ident.: DSC-22_20-50-20-00026110.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The aircraft is at 30 s or less from flying a flight plan discontinuity.

LIST OF 10 IN USE

Ident.: DSC-22_20-50-20-00026111.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The number of flight crew-stored runways, that are currently used by the FMS (in the F-PLN or in flight crew-stored routes), already reached the limit of 10, and the FMS rejects the attempt to create a new runway in the NEW RUNWAY page.

LIST OF 20 IN USE

Ident.: DSC-22_20-50-20-00026243.0003001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	I
Display Type	MCDU
Display Conditions	The number of flight crew-stored NAVAIDs or the number of flight crew-stored waypoints, that are currently used by the FMS (in the F-PLN or in flight crew-stored routes), already reached the limit of 20, and the FMS rejects the attempt to create a new NAVAID or a new waypoint.

Message Type	II
Display Type	MCDU
Display Conditions	The number of flight crew-stored waypoints, that are currently used by the FMS (in the F-PLN or in flight crew-stored routes), already reached the limit of 20, and the FMS rejects the additional waypoints received via uplink.

LIST OF 20 IN USE

Ident.: DSC-22_20-50-20-00026243.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	I
Display Type	MCDU
Display Conditions	The number of flight crew-stored NAVAIDs, that are currently used by the FMS (in the F-PLN or in flight crew-stored routes), already reached the limit of 20, and the FMS rejects the attempt to create a new NAVAID.

LIST OF 99 IN USE

Ident.: DSC-22_20-50-20-00026246.0006001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	I
Display Type	MCDU
Display Conditions	The number of flight crew-stored waypoints, that are currently used by the FMS (in the F-PLN or in flight crew-stored routes), already reached the limit of 99, and the FMS rejects the attempt to create a new waypoint.

Message Type	II
Display Type	MCDU
Display Conditions	The number of flight crew-stored waypoints, that are currently used by the FMS (in the F-PLN or in flight crew-stored routes), already reached the limit of 99, and the FMS rejects the additional waypoints received via uplink

MACH SEGMENT DELETED

Ident.: DSC-22_20-50-20-00026069.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The Constant Mach Segment (CMS) is automatically deleted in the active F-PLN, when one of the following occurs: - The flight crew activates the SEC F-PLN, or - An engine-out is detected, or - The flight phase changes from the cruise phase to another flight phase, or - The flight crew enters a lateral revision of the F-PLN which deletes the CMS.

MCDU OVERHEATED

Ident.: DSC-22_20-50-20-00026248.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The MCDU temperature exceeds the normal operating conditions. The MCDU displays a blank screen when idle, as it is in power saving mode.

NAV ACCUR DOWNGRAD

Ident.: DSC-22_20-50-20-00026117.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU and ND
Display Conditions	The navigation accuracy changed from HIGH to LOW. For more information, *Refer to DSC-22_20-20-20 Estimated Position Uncertainty*.

NAV ACCUR UPGRAD

Ident.: DSC-22_20-50-20-00026118.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU and ND
Display Conditions	The navigation accuracy changed from LOW to HIGH. For more information, *Refer to DSC-22_20-20-20 Estimated Position Uncertainty*.

NEW ACC ALT - HHHH

Ident.: DSC-22_20-50-20-00026249.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	On a climb waypoint, the flight crew enters an AT or AT OR BELOW altitude constraint. As a result, the FMS considers that the aircraft levels off below the acceleration altitude. The constraint altitude becomes the new acceleration altitude. HHHH corresponds to the altitude of the altitude constraint.

NEW CRZ ALT - HHHHH

Ident.: DSC-22_20-50-20-00026251.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The cruise flight level (on the INIT page or the PROG page) is automatically updated when the flight crew enters a new cruise altitude. HHHHH corresponds to the new cruise flight level.

NEW THR RED ALT - HHHH

Ident.: DSC-22_20-50-20-00026253.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	On a climb waypoint, the flight crew enters an AT or AT OR BELOW altitude constraint. As a result, the FMS considers that the aircraft levels off below the thrust reduction altitude. The constraint altitude becomes the new thrust reduction altitude. HHHH corresponds to the altitude of the altitude constraint.

NO ANSWER TO REQUEST

Ident.: DSC-22_20-50-20-00026481.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The FMS receives no answer to a datalink request that the flight crew sent more than four minutes ago.

NO FLS FOR THIS APPR

Ident.: DSC-22_20-50-20-00026263.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS does not compute the FLS beam for the approach that the flight crew selected. The FLS function is not available.

NO INTERSECTION FOUND

Ident.: DSC-22_20-50-20-00026255.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The FMS can neither find a shared waypoint nor an intersection during: - The addition of a VIA in the AIRWAYS page, or - The addition of a LAT/LONG crossing waypoint in the LAT REV page (LL XING / INCR/ NO).

NO NAV INTERCEPT

Ident.: DSC-22_20-50-20-00026127.0001001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	HDG(TRK) mode is engaged, and NAV mode is armed. NAV mode cannot engage, because the current aircraft trajectory does not intersect the FMS F-PLN before the TO waypoint.

NO SLS FOR THIS APPR

Ident.: DSC-22_20-50-20-00026302.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	All of the following conditions occur: - SBAS mode is selected in the SELECTED NAVAIDS page in the MCDU - The MMRs cannot decode the Final Approach Segment data block.

NO SLS ◁ MAN TUNING

Ident.: DSC-22_20-50-20-00026303.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew tries to tune the SLS ◁ manually.

NO SLS ◁ : SBAS DESELECTED

Ident.: DSC-22_20-50-20-00026304.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew selects the SLS ◁ in the RADIO NAV page while SBAS ◁ is deselected on the SELECTED NAVAIDS page in the MCDU.

NON UNIQUE ROUTE IDENT

Ident.: DSC-22_20-50-20-00026129.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	On the NEW ROUTE page, the flight crew attempts to enter a company route ident that already exists in the navigation database or in the flight crew-stored elements database.

NOT ALLOWED

Ident.: DSC-22_20-50-20-00026130.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The data entry or the data selection is not permitted.

NOT ALLOWED IN NAV

Ident.: DSC-22_20-50-20-00026256.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	NAV mode is engaged and the flight crew attempts to modify the TO waypoint.

NOT IN DATABASE

Ident.: DSC-22_20-50-20-00026132.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew enters the ident of an element that is neither in the navigation database, nor in the flight crew-stored elements database. The entered element can be one of the following: - A company route identifier - A FROM/TO waypoint - A place (airport, runway, waypoint, NAVAID) - A NAVAID frequency.

NOT XMITTED TO ACARS

Ident.: DSC-22_20-50-20-00026480.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew manually sends a downlink message through an MCDU page and the communication fails during the data transfer.

ONLY SPD ENTRY ALLOWED

Ident.: DSC-22_20-50-20-00026135.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The aircraft is not in the climb phase, and the flight crew attempts to enter a MACH value in the PRESEL field of the PERF CLB page.

PAGE UPDATE IN PROCESS

Ident.: DSC-22_20-50-20-00026137.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The update of the predictions is in progress, and the flight crew presses a key on the F-PLN page.

PERF DATA UPLINK

Ident.: DSC-22_20-50-20-00026461.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS receives performance initialization data, as part of a F-PLN uplink.

PLACE/D IN TRANSITION

Ident.: DSC-22_20-50-20-00026259.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	I
Display Type	MCDU
Display Conditions	The FMS rejects the flight crew entry, defined as a place/distance waypoint within a planned fixed-turn-radius transition between two flight legs.

PLEASE WAIT

Ident.: DSC-22_20-50-20-00026142.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The synchronization between both FMS is in progress.

PRINTER NOT AVAILABLE

Ident.: DSC-22_20-50-20-00026482.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	Communication with the printer is interrupted while printing a report.

PROCEDURE RNP IS XX.XX

Ident.: DSC-22_20-50-20-00026262.0007001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew manually enters an RNP value on the PROG page, and the entered value is more than the RNP value, defined in the navigation database for the active leg or route. XX.XX is the RNP value defined in the navigation database.

PROCEDURE RNP IS XX.XX

Ident.: DSC-22_20-50-20-00026262.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew manually enters an RNP value on the PROG page, and the entered value is more than or equal to the RNP value, defined in the navigation database for the active leg or route. XX.XX is the RNP value defined in the navigation database.

RADIONAV IS DESELECTED

Ident.: DSC-22_20-50-20-00026270.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew manually deselected the radio NAVAIDS on the SELECTED NAVAIDS page, and: - The aircraft is at 80 NM from the T/D, or - The aircraft is in the approach phase.

REENTER WEIGHT/CG

Ident.: DSC-22_20-50-20-00026298.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew enters a ZFW/ZFWCG that differs from the ZFW/ZFWCG received from the FCMC differ by more than 0.1 t (0.2 klb) or 0.1 %. The flight crew should enter again the ZFW and ZFWCG values.

REENTER ZFW/ZFWCG

Ident.: DSC-22_20-50-20-00026297.0001001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew enters a ZFW/ZFWCG that differs from the ZFW/ZFWCG received from the FCMC differ by more than 0.1 t (0.2 klb) or 0.1 %. The flight crew should enter again the ZFW and ZFWCG values.

REF/GPS POS DIFF ◁

Ident.: DSC-22_20-50-20-00026146.0003001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew enters a reference position on the IRS INIT page, which differs with the GPS position.

REF/LAST IRS POS DIFF

Ident.: DSC-22_20-50-20-00026271.0003001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew enters a reference position on the IRS INIT page, which differs with the last stored IRS position.

RESET IRS TO NAV

Ident.: DSC-22_20-50-20-00026148.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew modified the aircraft position on the INIT A page after the IRS alignment. In order to align the IRS with the modified position, the flight crew must reset the IRS to NAV mode.

RETRACT SPD BRK

Ident.: DSC-22_20-50-20-00026300.0005001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU and PFD
Display Conditions	Speedbrakes are extended, DES mode or FINAL APP mode is engaged, and one of the following occurs: - The aircraft is below the path and back on speed target, or - The aircraft is below the path.

RETRACT SPD BRK

Ident.: DSC-22_20-50-20-00026300.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU and PFD
Display Conditions	Speedbrakes are extended, DES mode or FINAL APP mode is engaged, and one of the following occurs: - ALT* or ALT CST* or ALT CRZ* or ALT or ALT CST or ALT CRZ mode engages, or - The aircraft is below the path, or - The flaps configuration becomes CONF 3 or FULL.

REVISIONS NOT STORED

Ident.: DSC-22_20-50-20-00026269.0002001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew stores an active or a SEC F-PLN as a NEW ROUTE. This message indicates that the following elements of the F-PLN are not stored: - Flight crew-entered holds - Offsets - Modifications to terminal area procedures - Flight crew-entered constraints - Pseudo waypoints - Step at optimum - Flight crew-entered Constant Mach Segment.

RTA DELETED

Ident.: DSC-22_20-50-20-00026151.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	A time constraint is automatically deleted from the active F-PLN, if one of the following occurs: - The FMGS detects an engine out condition - The aircraft enters a holding pattern - The flight crew inserts a second RTA in the same F-PLN at a different waypoint - The flight crew activates the ALTN F-PLN - The flight crew performs a DIR TO/ABEAM, and the time constrained waypoint is projected as an ABEAM point - The flight phase changes from descent or approach to climb or cruise - The UTC time is no longer valid.

RTA EXISTS

Ident.: DSC-22_20-50-20-00026275.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	I
Display Type	MCDU
Display Conditions	Before takeoff: The flight crew attempts to delete the FMS-computed ETT, while an RTA exists. In the descent phase: An RTA is already defined in the F-PLN, and the flight crew attempts to modify the managed speed in the PERF DES page.

RTA EXISTS

Ident.: DSC-22_20-50-20-00026275.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew attempts to delete the FMS-computed ETT, while an RTA exists.

RTA MISSED AT XXXXXXX

Ident.: DSC-22_20-50-20-00026276.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU and ND
Display Conditions	A waypoint is defined in the active F-PLN, and the RTA for this waypoint is predicted as not satisfied. XXXXXXX corresponds to the ident of the waypoint for which the RTA constraint will not be satisfied. In the case of an Enhanced RTA ◁ , the message is also displayed on the ND.

RWY/LS MISMATCH

Ident.: DSC-22_20-50-20-00026278.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	In the preflight or takeoff phase: The flight crew manually tunes an LS frequency in the RADIO NAV page, and this landing system disagrees with the selected takeoff runway in the F-PLN. In the climb, cruise, descent, ILS/GLS approach or go-around phase: The flight crew manually tunes an LS frequency in the RADIO NAV page, and this landing system disagrees with the selected destination runway in the F-PLN.

SELECT DESIRED SYSTEM

Ident.: DSC-22_20-50-20-00026161.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew can select a system on the displayed MCDU page.

SELECT TRUE

Ident.: DSC-22_20-50-20-00026281.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU and ND
Display Conditions	The NORTH REF pb-sw is set to MAG, while the IRS can no longer provide magnetic heading.

SET GREEN DOT SPEED

Ident.: DSC-22_20-50-20-00026283.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU and PFD

Display Conditions	All of the following conditions occur:
	- The FMGS detects an engine out condition
	- The flight crew selects a speed target which is:
	  - Equal to or above Green Dot +10 kt when ALT* or ALT are not engaged
	  - Equal to or below Green Dot -10 kt .

SET HOLD SPEED

Ident.: DSC-22_20-50-20-00026167.0008001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU and PFD
Display Conditions	The selected speed/Mach control is engaged. The flight crew inserts a hold in the F-PLN, and all of the following occur: - The difference between the selected speed and the hold speed is more than 5 kt - The aircraft enters the deceleration zone.

SET HOLD SPEED

Ident.: DSC-22_20-50-20-00026167.0002001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU and PFD
Display Conditions	The selected speed/Mach control is engaged. The flight crew inserts a hold in the F-PLN, and all of the following occur: - The difference between the selected speed and the hold speed is more than 5 kt - The aircraft is at 30 s or less from the deceleration zone.

SET MANAGED SPEED

Ident.: DSC-22_20-50-20-00026284.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU and PFD
Display Conditions	One of the following occurs: - At the transition to the cruise phase, the speed target is selected, and the flight crew did not enter a pre-selected speed, or - At the transition to the descent phase, the speed target is selected.

SETTING SPD/RTA

Ident.: DSC-22_20-50-20-00026092.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The system updates the managed speed target to satisfy the RTA constraints. The managed speed target is frozen during the update.

SPD ERROR AT XXXXXXX

Ident.: DSC-22_20-50-20-00026174.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	In managed lateral guidance, the FMS predicts that the aircraft speed will not satisfy a speed constraint by more than 10 kt. The message disappears when the aircraft speed satisfies the speed constraint by less than 5 kt. XXXXXXX corresponds to the ident of the waypoint for which the speed constraint will not be satisfied.

SPD LIM EXCEEDED

Ident.: DSC-22_20-50-20-00026175.0008001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	All of the following occur: - The aircraft speed is more than 10 kt over the speed limit or the Green Dot speed whichever is higher - The aircraft altitude is more than 150 ft below the speed limit altitude.

SPD LIM EXCEEDED

Ident.: DSC-22_20-50-20-00026175.0002001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP

Message Type	II
Display Type	MCDU
Display Conditions	All of the following occur: - The aircraft speed is more than 10 kt over the speed limit - The aircraft altitude is more than 150 ft below the speed limit altitude.

SPECIF NDB UNAVAIL

Ident.: DSC-22_20-50-20-00026176.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The NDB (defined for an NDB approach) is deselected or not available.

SPECIF VOR-D UNAVAIL

Ident.: DSC-22_20-50-20-00026177.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU and ND
Display Conditions	The VOR or VOR/DME (defined for a RNAV or VOR approach) is deselected or not available.

STEP ABOVE MAX FL

Ident.: DSC-22_20-50-20-00026178.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The entered step altitude is above the recommended maximum flight level. For information about the recommended maximum flight level, *Refer to DSC-22_20-40-30 Other Computations - Recommended Maximum Altitude (REC MAX)*.

STEP AHEAD

Ident.: DSC-22_20-50-20-00026264.0001001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The aircraft is at less than 20 NM from the start waypoint of a step climb or a step descent.

STEP DELETED

Ident.: DSC-22_20-50-20-00026180.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS deleted or sequenced a step climb or a step descent.

STORED ROUTES FULL

Ident.: DSC-22_20-50-20-00026139.0002001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The number of routes, that are currently stored in the FMS (in the flight crew-stored routes), already reached the limit of 5 and the flight crew attempts to create a new route. The new route creation is rejected.

T/D REACHED

Ident.: DSC-22_20-50-20-00026237.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU and PFD
Display Conditions	The managed speed/Mach control is engaged, the aircraft reaches the T/D, and the FMS does not switch to the descent phase.

TAKE OFF DATA UPLINK

Ident.: DSC-22_20-50-20-00026466.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS receives a takeoff data uplink. The flight crew can review the takeoff data and insert it in the active F-PLN via the UPLINK MAX TO DATA or the UPLINK FLX (or DRT) TO DATA pages.

TEMPORARY F-PLN EXISTS

Ident.: DSC-22_20-50-20-00026287.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	One MCDU displays a TMPY F-PLN, and the flight crew attempts one of the following: - To select any key (except the ERASE or the INSERT key), or - To activate the SEC F-PLN.

TIME ERROR AT XXXXXXX

Ident.: DSC-22_20-50-20-00026289.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	In managed lateral guidance, the FMS predicts that the aircraft speed will not satisfy a time constraint. XXXXXXX corresponds to the ident of the waypoint for which the time constraint will not be satisfied.

TIME MARKER LIST FULL

Ident.: DSC-22_20-50-20-00026185.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The F-PLN time markers already reached the limit of 4, and the flight crew attempt to insert a new time marker.

TIME TO EXIT

Ident.: DSC-22_20-50-20-00026186.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The aircraft must immediately leave the holding pattern in order to comply with the fuel reserve requirements. The fuel reserve requirements consider that the extra fuel is equal to 0 at landing at the destination airport.

TMPY UPLINK DELETED

Ident.: DSC-22_20-50-20-00026488.0005001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU
Display Conditions	An ATC F-PLN is uplinked and prefilled data that is pending insertion in the active F-PLN is deleted because any of the following conditions occur: - The flight crew displays a different page, or - A prefilled waypoint is already sequenced.

TO SPEEDS TOO LOW

Ident.: DSC-22_20-50-20-00026239.0005001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

L12

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew inserts at least one takeoff speed (V1, VR or V2) that is below the corresponding minimum speed determined by the FMS, based on VMCG, VMCA and VS1G. Associated with an ECAM alert.

TOO STEEP PATH AHEAD

Ident.: DSC-22_20-50-20-00026290.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	In NAV mode, the FMS detects a too steep path in the vertical descent profile, in one of the following flight phases: - The cruise phase at less of 150 NM of the destination, or - The descent phase, or - The approach phase.

TUNE BBB FFF.FF

Ident.: DSC-22_20-50-20-00026191.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The flight crew manually selected a NAVAID, and the FMS cannot automatically tune the desired NAVAID. BBB corresponds to the NAVAID ident. FFF.FF corresponds to the associated frequency.

TURN AREA EXCEEDANCE

Ident.: DSC-22_20-50-20-00026292.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	In NAV mode, the aircraft is at 1.5 min before the entrance in a procedure turn leg, and the lateral path in the leg exceeds the protection envelope defined in the navigation database.

UNKNOWN PROGRAM PIN

Ident.: DSC-22_20-50-20-00026193.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The aircraft pin program combination (aircraft type, engine type, VMO/MMO parity) is not compatible or not defined in the FMGEC software. The system is then not able to initialize.

UPLINK INSERT IN PROG

Ident.: DSC-22_20-50-20-00026456.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The FMS displays this message during the insertion of a F-PLN uplink.

UPLINK INSERTED IN SEC

Ident.: DSC-22_20-50-20-00026489.0007001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU
Display Conditions	An ATC uplink message is successfully loaded in the SEC F-PLN.

UPLINK INSERTED IN TMPY

Ident.: DSC-22_20-50-20-00026490.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU
Display Conditions	An ATC uplink message is successfully loaded in a prefilled page or in the TMPY F-PLN.

USING COST INDEX-NNN

Ident.: DSC-22_20-50-20-00026194.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	I
Display Type	MCDU
Display Conditions	One of the following occurs: - The FMS uses the CI value entered during the previous flight, because for the current flight, the flight crew entered the ZFW or the GW only, and did not define the new CI previously, or - The flight crew activates the ALTN F-PLN and the current CI is not equal to 0, then the FMS sets the CI of the ACTIVE F-PLN to 0. NNN corresponds to the CI value used by the FMS.

USING COST INDEX-NNN

Ident.: DSC-22_20-50-20-00026194.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP

Message Type	I
Display Type	MCDU
Display Conditions	The FMS uses the CI value entered during the previous flight, because for the current flight, the flight crew entered the ZFW or the GW only, and did not define the new CI previously. NNN corresponds to the CI value used by the FMS.

V1/VR/V2 DISAGREE

Ident.: DSC-22_20-50-20-00026196.0002001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	V1, VR, and V2 do not satisfy the condition V1 ≤ VR ≤ V2.

WAIT FOR SYSTEM RESPONSE

Ident.: DSC-22_20-50-20-00026197.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	After a system selection in the MCDU MENU Page, the system page is not immediately displayed.

WIND DATA UPLINK

Ident.: DSC-22_20-50-20-00026470.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	II
Display Type	MCDU
Display Conditions	The FMS receives a wind data uplink. The flight crew may review the wind data in the ACTIVE or the SEC F-PLN page.

WIND UPLINK EXISTS

Ident.: DSC-22_20-50-20-00026477.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew attempts to modify the winds in the active or secondary F-PLN while a wind data uplink is pending insertion.

WIND UPLINK PENDING

Ident.: DSC-22_20-50-20-00026474.0001001 / 03 NOV 23
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

Message Type	II
Display Type	MCDU
Display Conditions	The FMS receives a wind data uplink while the DIR TO page is displayed or a TMPY F-PLN exists. The flight crew can insert the wind data after the DIR TO is performed or cancelled or after the TMPY F-PLN is inserted or cancelled.

WIND/TEMP UPLK PENDING

Ident.: DSC-22_20-50-20-00026475.0008001 / 03 NOV 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

Message Type	II
Display Type	MCDU
Display Conditions	The FMS receives a wind and temperature data uplink while the DIR TO page is displayed or a TMPY F-PLN exists. The flight crew can insert the wind and temperature data after the DIR TO is performed or cancelled or after the TMPY F-PLN is inserted or cancelled.

XXXX IS DESELECTED

Ident.: DSC-22_20-50-20-00026294.0001001 / 03 NOV 23
Applicable to: ALL

Message Type	I
Display Type	MCDU
Display Conditions	The flight crew attempts one of the following: - To deselect a NAVAID (via the SELECTED NAVAID page) already deselected, or - To manually tune a NAVAID (via the RADIO NAV page) already deselected. XXXX corresponds to the ident of the deselected NAVAID.

MCDU DATA FORMAT LIST

Ident.: DSC-22_20-50-30-00001244.0025001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

The following chart lists all the data the flight crew may enter on the MCDU.
It also shows the acceptable format for the various data items, the acceptable range, the units of entry, and the MCDU pages on which the data can be entered.

The following codes are used to indicate various data formats:

A : letters
N : numbers
X : letters and numbers

DATA NAME	FORMAT		UNITS	DISPLAY PAGE

GENERAL

Ident.: DSC-22_20-60-10-00001306.0001001 / 10 DEC 09
Applicable to: ALL

The baro reference selector of the EIS (Electronic Instrument System) allows the pilot to use the standard barometric reference (STD), sea level atmospheric pressure (QNH), or atmospheric pressure at airfield elevation (QFE option) for the barometer setting.
The selected value is displayed in the baro reference display window of the EFIS control panel and on the Primary Flight Display (PFD) below the altitude scale.
The barometer setting is used as a reference for the altimeter of the PFD and for the PFD target altitude. In flight, it affects the predicted altitudes on the MCDU and the descent path computation.

MCDU ALTITUDE PREDICTIONS

Ident.: DSC-22_20-60-10-00001307.0001001 / 17 MAR 11
Applicable to: ALL

The FMGES predicts at each waypoint of the flight plan an altitude that is a function of all data in the lateral and vertical flight plans.

ON THE GROUND

The altitude predicted at each waypoint is displayed as altitude in feet above mean sea level (AMSL) when it is below the transition altitude and as flight level when it is above the transition altitude. The altitude constraints are also displayed, and they follow the same rule (feet or flight level).
The predicted altitude is equal to the airport elevation plus the height you must attain in order to reach the waypoint in the applicable mode (climb or descent)

F-PLN A page

IN FLIGHT

The predicted altitude is equal to the aircraft altitude (depending on the barometer setting), plus (or minus) the height you must attain to reach the waypoint in the applicable mode (climb or descent).

- In climb :
  Altitude predictions and constraints are displayed as altitude in feet above mean sea level (AMSL) at, or below, the transition altitude, and as flight level above it.
  For example : If the transition altitude is 5 000 ft, and you insert an altitude constraint as 8 000 ft, the MCDU F-PLN A page shows it as FL 80.
- In descent :
  If “STD” is selected on the control panel of the EIS altitude predictions, and constraints above the transition level are displayed as flight levels, and those below the transition level are displayed as altitude AMSL.
  If sea level pressure (QNH), or field elevation pressure (QFE option), is selected on the EIS control panel, altitude predictions and constraints are displayed as altitudes AMSL, regardless of the transition altitude.
  For example : If the transition level is FL 50 and you insert an altitude constraint of 8 000 ft in the descent profile, the MCDU F-PLN A page will display it as FL 80 if “STD” is selected, and as 8 000 ft if the “QNH” or “QFE” option is selected.

TARGET ALTITUDE ON PFD

Ident.: DSC-22_20-60-10-00001308.0001001 / 17 MAR 11
Applicable to: ALL

The PFD target altitude may either be :
- The FCU-selected altitude, or
- A flight management altitude constraint, if the climb mode or descent mode is engaged, and the system predicts a level-off at a constraint that is achieved prior to reaching the FCU altitude.

The PFD target altitude depends on the barometer setting :
- If “STD” is selected, the target is a flight level.
- If “QNH” or “QFE” is selected, the target is an altitude or a height.

The aircraft will level off accordingly.

Note: *If the pilot changes the barometer pressure during ALT* or ALT CST*, the aircraft may overshoot the target altitude, because the current value has been changed. However, the ALT* and ALT CST* modes allow the aircraft to regain the FCU altitude.*
As a general rule, avoid changing the barometer setting when in ALT or ALT CST*.*

NOTE FOR AIRCRAFT WITH QFE (FIELD ELEVATION PRESSURE) PIN PROGRAM

Ident.: DSC-22_20-60-10-00001309.0001001 / 01 OCT 12
Applicable to: ALL

If QFE is selected on the EFIS control panel :

- The MCDU predictions follow the basic rules (altitudes are AMSL below the transition level, flight levels above it).
- The altitude constraints on the MCDU follow the basic rules.
- The target altitude on the PFD is QFE related :
  - If the target altitude has been selected by the FCU, the aircraft will level off there.
  - If the target altitude is an altitude constraint, the PFD automatically shows that constraint as corrected by the airport elevation.

PROCEDURES

Ident.: DSC-22_20-60-20-00001310.0001001 / 08 JUL 15
Applicable to: ALL

a. The altitude constraints in departure and arrival procedures should be defined in the navigation database or by the pilot on the MCDU:
   - In terms of altitude AMSL below the transition altitude
   - In terms of flight level above the transition altitude

   If a departure procedure defines an altitude constraint as an AMSL altitude above the transition altitude, you must convert it to flight level, because the system and guidance will treat it as a flight level whenever you select the standard barometer setting.

b. In climb you should switch from QNH (or QFE) to STD on both EFIS control panels simultaneously when you reach the transition altitude.
   All MCDU altitude predictions and altitude constraints and all PFD altitude targets will be displayed as flight level.

c. In descent, when ATC clears you to an altitude below the transition altitude, you can select QNH (or QFE) on both EFIS control panels simultaneously.
   All MCDU altitude predictions and constraints and PFD targets are now altitude AMSL.

Intentionally left blank

CLEARING THE SCRATCHPAD OF DATA OR MESSAGES

Ident.: DSC-22_20-60-30-00001311.0001001 / 10 DEC 09
Applicable to: ALL

Press the “CLR” key with a single brief touch to erase the last alphanumeric character inserted in the scratchpad.
Press the key for more than three seconds to erase all the data inserted in the scratchpad. If the scratchpad is empty, it displays “CLR”.

CLEARING DATA FIELDS

Ident.: DSC-22_20-60-30-00001312.0001001 / 16 MAR 11
Applicable to: ALL

From a empty scratchpad, press the CLR key, then select the prompt for the field you want to clear (3L for example).

- You cannot clear all data fields:
  - If the field contains data that has a default value or a value computed by the FMGEC, the data reverts to this value.
  - Any attempt to clear the defaulted value has no effect.
- Clearing a constraint on the F-PLN A page deletes both the speed constraint and the altitude constraint associated with the waypoint.
- If you clear a data field that is a waypoint in the flight plan (primary or secondary) you delete this waypoint from the flight plan and create a discontinuity. The discontinuity can also be cleared in a similar way.

GENERAL

Ident.: DSC-22_20-60-40-00001313.0001001 / 16 MAR 11
Applicable to: ALL

When the FMGES detects an engine-out condition, the following occurs:

FLIGHT MANAGEMENT PART

Ident.: DSC-22_20-60-40-00001314.0001001 / 16 MAR 11
Applicable to: ALL

- The managed target speeds are immediately set to a value that depends upon the flight phase
- The system automatically calls up the current performance page, which has the E.O. CLR (engine-out clear) prompt, displayed in the 1R field (except during takeoff, before the diversion point is reached).
  If the pilot presses the E.O. CLR key, the all engine operative predictions and performance will be restored. Reverting to one engine-out performance again is not possible, unless the system detects a new E.O. condition. Therefore, the pilot should not press the E.O. CLR key, if an actual engine-out is detected.
- The PROG page shows the recommended engine-out maximum (E.O. REC MAX) altitude
- All preselected speeds, entered in the MCDU, are deleted. The crew can re-enter preselected speeds
- Step climb (or step descent), if entered, is deleted
- The time constraint is deleted.

FLIGHT GUIDANCE PART

Ident.: DSC-22_20-60-40-00001316.0003001 / 16 MAR 11
Applicable to: ALL

- All selected modes remain available (the “HDG/TRK”, “V/S”, and “OPEN” modes, for example)
- In the Speed Reference System (SRS) mode, the takeoff speed is the highest of V2 and current speed, but no more than V2 + 15. The Go-around speed target is VAPP, or the current speed if higher, but limited to VLS + 15 kt
- The system limits Autopilot (AP) and Flight Director (FD) bank angles during the takeoff and approach phases, as follows:
  - 15 ° when the aircraft speed is below maneuvering speeds (F, S, or Green Dot speed), - 10 kt
  - Then linear increase to 25 ° up to maneuvering speeds (F, S, or Green Dot speed) - 3 kt
  - 25 ° above maneuvering speeds (F, S, or Green dot speed) - 3 kt.

AUTOTHRUST

Ident.: DSC-22_20-60-40-00001317.0001001 / 04 MAY 23
Applicable to: ALL

The system extends the active range of the active engine from idle to maximum continuous thrust (MCT instead of CL thrust).
The Flight Mode Annunciator requests maximum continuous thrust on the live engine, at a time that depends on when the engine-out occurs.

Note: *Refer to DSC-22_30-50-50 ALPHA FLOOR for Alpha Floor inhibition in engine-out.*

ENGINE OUT CONDITIONS

Ident.: DSC-22_20-60-40-00001318.0001001 / 10 MAY 21
Applicable to: ALL

The FMGES considers the aircraft to be in an engine-out condition, when one of the following conditions is present, and the aircraft has started the takeoff, or is in flight:
- One engine master lever is off, or
- N2 (or N3 for Rolls Royce engines) is below idle, or
- One thrust lever is at IDLE position or slightly above IDLE position (0 ° < TLA < 5 °) and one thrust lever is above IDLE position area (5 ° < TLA < MAX TLA), or
- Communication between FMGEC and FADEC is lost.

ENGINE-OUT SID OPERATIONS

Applicable to: ALL

Ident.: DSC-22_20-60-40-A-00002683.0001001 / 01 OCT 12

An Engine-Out Standard Instrument Departure (EOSID), when defined in the database, is always for a specific runway. It is indicated on the bottom line of the SID page for that runway, and it can be manually selected.
The pilot can review the SID by either selecting the PLAN mode on the navigation display (solid yellow line), or by selecting it on the SID page. In the latter case, the navigation display shows the SID as a temporary flight plan.
The last point, if any, that is common to the SID and Engine-Out SID is called the Diversion Point (DP).

EOSID on plan mode (displayed whether selected or not) TOU/08 is the diversion point (DP)

Ident.: DSC-22_20-60-40-A-00005865.0001001 / 01 OCT 12

WHEN AN ENGINE-OUT CONDITION OCCURS BEFORE THE DIVERSION POINT

The MCDU automatically shows the engine-out SID as a temporary flight plan on the F-PLN page and on the ND. The EOSID can be inserted or erased.

Note: *The EOSID Diversion Point is the waypoint at which the EOSID diverges from the active SID.*
If there is no common leg between the SID and the EOSID in the navigation database, the diversion point is by default the runway threshold. Therefore the SID and EOSID common leg(s) before the flight paths separation must be the same type and nature.

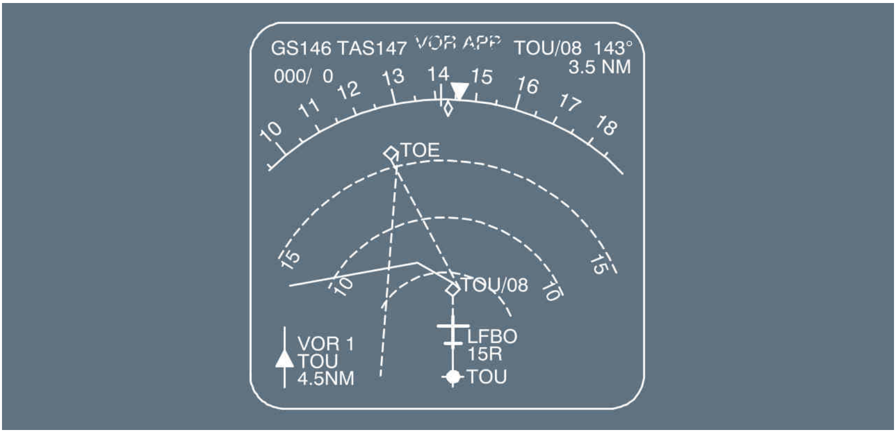
EOSID YELLOW LINE

Ident.: DSC-22_20-60-40-A-00005867.0001001 / 19 DEC 12

BELOW THRUST-REDUCTION (THR RED) ALTITUDE

- The managed target speed changes.
- The PROG page displays the engine-out maximum recommended altitude.
- The PERF TO page comes up on the display automatically, with the “EO CLR” prompt in the 1R field.
- The MCDU and the navigation display show the engine-out SID as a temporary flight plan, or the navigation display shows it for information only, depending upon the diversion point location.
- The system computes the flight plan predictions when the aircraft transitions to the climb phase.



PROCEDURE

When the aircraft reaches the engine-out acceleration altitude :

PUSH the ALT pushbutton on the FCU.

The target speed jumps to the engine-out long-range cruise, limited by SPD LIM/SPD CSTR.

CLEAN up your configuration as the speed increases toward target speed.

When the aircraft is clean and has reached green dot speed , “LVR MCT” flashes on the FMA.

PULL the altitude selector knob to resume the climb.

The OP CLB mode engages.

MOVE the thrust lever(s) for the live engine(s) to “MCT” detent.

Ident.: DSC-22_20-60-40-A-00005868.0001001 / 16 MAR 11

ABOVE THRUST REDUCTION (THR RED) ALTITUDE

- The managed target speed changes.
- “LVR MCT” flashes white on the flight mode annunciator.
- The PROG page displays the engine-out maximum recommended altitude.
- The PERF TO page displays the “EO CLR*” prompt in the 1R field.
- The navigation display shows the EOSID.

PROCEDURE

MOVE the thrust lever(s) of the active engine(s) to the MCT detent.

- **When the aircraft reaches the engine-out acceleration altitude :**

  PRESS the ALT pushbutton on the FCU.

  The target speed jumps to the engine-out long-range cruise, limited by SPD LIM/SPD CSTR.

  CLEAN UP configuration as the speed increases.

- **When the aircraft reaches Green Dot speed :**

  PULL the ALT knob to resume the climb.

  The OP CLB mode engages.

  Note: *If it is necessary, move the thrust lever(s) of the active engine(s) to the TOGA detent. The Flight Mode Annunciator will display “LVR MCT”, flashing in amber, when the aircraft reaches Green Dot speed. If NAV mode is engaged and predictions are available, CLB mode may also be used to resume the climb.*

ENGINE-OUT IN CLB PHASE (ABOVE ACCELERATION ALTITUDE)

Applicable to: ALL

Ident.: DSC-22_20-60-40-B-00001320.0001001 / 16 MAR 11

ENGINE-OUT OCCURS WHILE AIRCRAFT IS BELOW EO REC MAX

- The managed target speed changes to Green Dot speed.
  If the aircraft is in ALT or ALT* mode, the speed target is the engine-out long range cruise speed at that altitude, limited by SPD LIM or SPD CSTR.
  The target speed change is gradual, so as to prevent a strong thrust reduction.
- “LVR MCT” flashes amber on the Flight Mode Annunciator.
- The system computes the flight plan predictions down to the primary destination, assuming that the cruise phase will be flown at the lower of CRZ ALT or EO REC MAX.
- The MCDU shows the PERF CLB page with an “EO CLR*” (clear engine-out) prompt.
- The PROG page shows the engine-out maximum recommended altitude (EO REC MAX).

PROCEDURE

MOVE the thrust lever(s) for the live engine(s) to the MCT detent.
SET the altitude on the Flight Control Unit to an altitude below the engine-out maximum recovery altitude, as cleared by ATC.
INITIATE a diversion, when cleared to do so.

Ident.: DSC-22_20-60-40-B-00005869.0001001 / 10 DEC 09

ENGINE-OUT OCCURS WHILE THE AIRCRAFT IS ABOVE EO REC MAX

- "LVR MCT" (maximum continuous thrust) flashes amber on the Flight Mode Annunciator.
- The climb mode (if engaged) reverts to open climb (OP CLB).
- The system computes the flight plan predictions down to the primary destination, assuming that the aircraft immediately drifts from the current altitude down to the EO MAX ALT at green dot, and then cruises at this altitude

Note: *You cannot arm or engage CLB mode, above EO REC MAX.*

PROCEDURE

Same as engine-out in cruise phase (*Refer to DSC-22_20-60-40 Engine-Out in Cruise Phase*).

ENGINE-OUT IN CRUISE PHASE

Ident.: DSC-22_20-60-40-00001321.0001001 / 17 NOV 20
Applicable to: ALL

The system sets the managed target speed to the long range engine-out cruise at that altitude.
If the aircraft is above the Engine-Out Maximum Altitude (EO REC MAX), the target speed is the long range engine-out cruise speed at EO REC MAX. The target speed change is gradual, so as to prevent a strong engine thrust reduction.

- LVR MCT flashes on the Flight Mode Annunciator.
- The performance cruise page appears with the "EO CLR*" (clear engine-out) prompt, and displays the level off altitude assuming descent and cruise at green dot speed (obstacle strategy).
- The progress page displays "EO REC MAX".
- The system computes the flight plan predictions down to the primary destination, assuming that the cruise phase at the lower of CRZ FL or EO REC MAX.

PROCEDURE

Perform the engine-out abnormal procedure.
Refer to the "Single Engine Operations" procedures (*Refer to EFB-IFT-30 One Engine Inoperative Strategies*).

Initiate a diversion, if necessary.

Note:
- *The engine-out descent strategy requires disconnection of the autothrust, and descent in OPEN DES mode.*
  Disconnecting the autothrust prevents an automatic setting of THR IDLE, therefore, the autopilot will fly the target speed in OP DES mode with a thrust manually selected by the crew.
  When reaching the FCU-selected altitude, or whenever normal descent is resumed to a lower altitude, reengage the autothrust.
- *DES mode is not available above EO REC MAX.*

ENGINE-OUT IN DESCENT PHASE

Ident.: DSC-22_20-60-40-00001322.0001001 / 16 MAR 11
Applicable to: ALL

- The managed target speed remains unchanged (ECON DES Mach number or speed, with any speed limitations).
- “LVR MCT” flashes on the Flight Mode Annunciator.
- The PERF DES page appears, showing the “EO CLR*” prompt.
- The PROG page displays the engine-out maximum altitude (EO REC MAX).
- The descent mode (if engaged) reverts to V/S, if the aircraft is above the EO REC MAX. If not, the descent mode is maintained.

PROCEDURE

MOVE the thrust lever(s) for the live engine(s) to the MCT detent.
If necessary, SELECT a suitable flight mode for descent.
DISCONNECT the autothrust and ADJUST thrust, if necessary.

Note: *The system recomputes the descent and approach paths, based on 2 or 3 engine models for the A340, or on a single engine model for the A330.*

ENGINE-OUT IN APPROACH PHASE

Ident.: DSC-22_20-60-40-00001323.0001001 / 16 MAR 11
Applicable to: ALL

- The aircraft maintains approach speed (VAPP)
- “LVR MCT” flashes on the Flight Mode Annunciator
- The PERF APPR page appears, showing the “EO CLR*” prompt
- The PROG page displays the engine-out maximum altitude (EO REC MAX).

PROCEDURE

MOVE the thrust lever(s) for the live engine(s) to the MCT detent.

SELECT a suitable flight mode as for an all engine approach.

CAUTION	*Below maneuvering speed (F, S, Green Dot) - 10 kt, the autopilot or flight director (AP/FD) cannot order a bank angle greater than 15 °. Above maneuvering speed - 10 kt, this limit linearly increases until it reaches 25 ° at maneuvering speed - 3 kt. The limit is then 25 ° for all speeds above maneuvering speeds - 3 kt.*

ENGINE-OUT IN GO-AROUND PHASE

Ident.: DSC-22_20-60-40-00001324.0001001 / 16 MAR 11
Applicable to: ALL

The results and procedures for takeoff phase apply, however the displays do not show the engine-out SID.

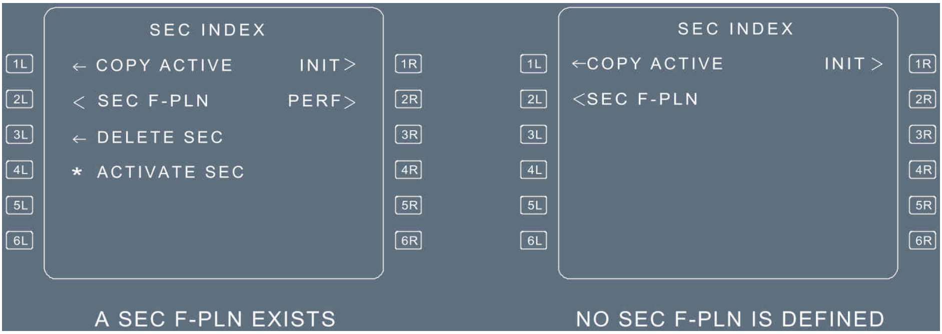
Note: *If ALT* engages out of SRS mode, and an engine-out occurs simultaneously, an airspeed loss may be encountered during the altitude capture.*

SECONDARY FLIGHT PLAN

Ident.: DSC-22_20-60-50-00001325.0001001 / 17 MAR 11
Applicable to: LV-GKO, LV-GKP

The secondary flight plan (SEC F-PLN) is an alternative flight plan which can be activated when required.
It may include all the vertical elements except history wind data.

The flight crew can:
- Create a secondary flight plan independently from the active flight plan (a secondary flight plan can be created while a temporary flight plan exists)
- Copy it from the active flight plan
- Delete it completely
- Activate it, when the “ACTIVATE SEC” prompt is displayed: The secondary flight plan becomes the active flight plan.



A SEC F-PLN EXISTS

NO SEC F-PLN IS DEFINED

- The screen displays the “ACTIVATE SEC” prompt in flight if:
  - HDG (or TRK) mode is engaged, or
  - NAV mode is engaged, and the active leg of the primary and secondary flight plans is the same.
- The screen displays the “INIT” prompt if the secondary flight plan is not a copy of the active flight plan.

The FMS sequences the secondary flight plan the same way as the active flight plan, when it is a copy of the active flight plan.
The navigation display shows the secondary flight plan in white. In PLAN mode, the flight crew can use the slew keys to review the secondary flight plan (as for the primary flight plan).

PREDICTIONS

The FMGES computes predictions using the same performance methods and performance factor as for the active flight plan. However, it predicts pseudo waypoints only for the Multifunction Control and Display Unit (MCDU), and not for the Navigation Display (ND).

- **When the flight crew initializes the secondary flight plan with the SEC INIT function:**
  The FMGES computes the secondary flight plan predictions as if the aircraft were on ground before engine start. The FMGES computes these predictions one time and does not update them to indicate the progress of the flight (aircraft position, fuel consumption, etc.).
- **When the flight crew initializes the secondary flight plan with the COPY ACTIVE function:**

  The FMGES computes the secondary flight plan predictions as for the active flight plan. However:
  - The FMGES stops the update and the display of the predictions if the first leg of the active flight plan is no longer the same as the active leg (i.e. if both flight plans diverge).

    Note: *This does not apply to the preflight phase, when the FMGES computes the predictions if the departure airports are the same, even if the takeoff runways are different.*

  In the SEC F-PLN, the computed distance between the "TO" waypoint, and the following waypoints may be erroneous when:
  - ■ The SEC F-LPN is created using the COPY ACTIVE function
  - ■ Lateral modifications are performed in either the active, or the SEC F-LPN
  - ■ The "TO" waypoint and/or the following waypoint differ between the ACTIVE , and the SEC F-PLN.

  Note: *1. As a result, in the SEC P-PLN, fuel and time predictions are also erroneous because they are computed using the erroneous distance.*
  2. If the SEC F-PLN is activated, the resulting ACTIVE F-PLN is not affected: Distances and fuel/time computations in the active F-PLN are correct.
- **The flight crew may use the secondary flight plan in the following cases:**
  - At takeoff when an alternate takeoff runway is probable
  - On ground to initialize the FMGES again if the flight that the flight crew initially prepared is replaced by another flight (*Refer to PRO-NOR-SRP-01-05 Introduction*)
  - In flight to prepare a diversion
  - In flight when an alternate landing runway is probable
  - To prepare the next flight.

SECONDARY FLIGHT PLAN

Ident.: DSC-22_20-60-50-00001325.0015001 / 01 OCT 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The secondary flight plan (SEC F-PLN) is an alternative flight plan which can be activated when required.
It may include all the vertical elements except history wind data.

The flight crew can:

- Create a secondary flight plan independently from the active flight plan (a secondary flight plan can be created while a temporary flight plan exists)
- Copy it from the active flight plan
- Delete it completely
- Activate it, when the “ACTIVATE SEC” prompt is displayed: The secondary flight plan becomes the active flight plan.

  The FMGES computes the secondary flight plan predictions as for the active flight plan. However:
  - The FMGES stops the update and the display of the predictions if the first leg of the active flight plan is no longer the same as the active leg (i.e. if both flight plans diverge). The flight phase is the same as the flight phase at the time of the divergence.

    Note: *This does not apply to the preflight phase, when the FMGES computes the predictions if the departure airports are the same, even if the takeoff runways are different.*

The flight crew may use the secondary flight plan in the following cases:
- At takeoff when an alternate takeoff runway is probable
- On ground to initialize the FMGES again if the flight that the flight crew initially prepared is replaced by another flight (*Refer to PRO-NOR-SRP-01-05 Introduction*)
- In flight to prepare a diversion
- In flight when an alternate landing runway is probable
- To prepare the next flight.

STORED ROUTE FUNCTION

Ident.: DSC-22_20-60-60-00001326.0001001 / 17 MAR 11
Applicable to: ALL

The stored route function allows the pilot to store or review as many as five different routes defined in an active or secondary flight plan.

This also allows the pilot to store a company route that is not yet in the database, but is expected to be flown several times (a charter route, for example).

Access the STORED ROUTES page from the DATA INDEX page.

SELECT the DATA key on MCDU
PRESS the next page key
PRESS the “STORED ROUTES” key
PRESS the “NEW ROUTES” key
ENTER the company route name (optional)
PRESS the “STORE SECONDARY F-PLN” key

Note:
- *In either case, you may store a company route only if the active or secondary flight plan is complete from origin to destination.*
- *If you do not enter a name, the FMGEC names the stored route automatically as “SRTE 1 (or 2 ...)” when it is stored.*
- *The system does not retain several elements of the flight plans when you store them :*
  - *Pilot-entered holds*
  - *Offsets*
  - *Pilot-entered constraints*
  - *Modifications to a terminal procedure*
  - *Pseudo waypoints*

    When this happens, it displays “REVISIONS NOT STORED”.
- *If you already stored five routes, the system will reject a new entry and display “STORED ROUTES FULL” on the MCDU. Delete one stored route by clearing the CO RTE name before inserting a new one.*

TIME MARKER

Ident.: DSC-22_20-60-70-00001327.0001001 / 01 OCT 12
Applicable to: ALL

The pilot can enter a time marker in the F-PLN A or B page. Once entered, the FMGES displays a pseudo waypoint along the flight plan on the MCDU and on the navigation display. This pseudo waypoint shows the predicted location of the aircraft at the entered time.

HOW TO INSERT A TIME MARKER

WRITE the time marker in the scratchpad. The entry format is HHMM.
SELECT any left key of the F-PLN A or B page, to insert the time marker in the active flight plan.

The time marker is inserted in the flight plan according to time criteria, irrespective of the key choosen for entry.

Prediction are recomputed. Time marker pseudo-waypoint is inserted along the active F-PLN (MCDU and ND)

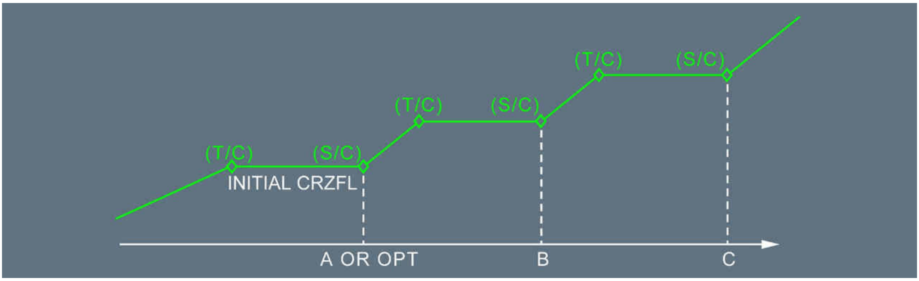
Up to 4 time markers may exist at a time. An attempt to enter a fifth time marker will cause the message "TIME MARKER LIST FULL" to appear on the scratchpad.
The FMGES updates the time marker position with the predictions.
When the current clock time equals or exceeds the time marker entry, the FMGES sequences the time marker (even in preflight).

Intentionally left blank

STEP CLIMB/STEP DESCENT

Ident.: DSC-22_20-60-80-00001328.0008001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

The STEP ALTS function allows to define the successive CRZ FLs and to determine the optimum position to initiate a climb from the initial (or current) CRZ FL to the next one.



PRINCIPLE

GEOGRAPHIC STEPS

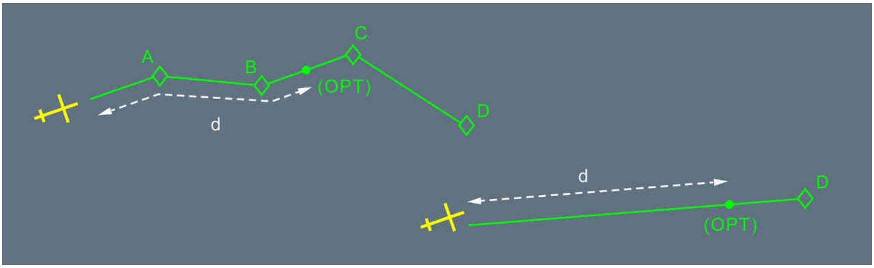
Up to four geographic steps may be defined on the STEP ALTS page. These steps are initiated at a geographical position, along the F-PLN.

Rules

- The minimum step size is 1 000 ft
- A S/C cannot follow a S/D
- A STEP is automatically cleared:
  - If the S/C (S/D) is sequenced without any level change commanded by the flight crew
  - If the flight crew achieves a LAT REV which deletes the associated waypoint from the F-PLN
  - By EO condition.
- A STEP is manually cleared:
  - On the STEP ALTS page, by CLEARING the corresponding field
  - On the F-PLN page, by CLEARING the (S/C) (S/D) pseudo waypoint.
- A STEP entry is IGNORED if the remaining CRZ distance is less than approximately 50 NM
- When the steps are inserted in the F-PLN, they are displayed:
  - On the MCDU as (S/C), (S/D), (T/C), (T/D) pseudo waypoints
  - On the ND by associated ↗, ↘, ↘ white symbol.

OPTIMUM STEP

When geographic steps are inserted, or an altitude is entered, the FM proposes an OPTIMUM STEP start of climb position for the first step climb altitude ahead. Predicted FUEL and TIME savings are displayed when calculated to be greater than 100 kg or 1 min respectively. If no savings are found, no optimum step is proposed.
The OPT STEP is not automatically inserted: The flight crew has to insert it if appropriate. When inserted, the OPT STEP point (OPT), is then a fixed geographical point.
If, subsequently, some F-PLN parameters are changed (winds, new waypoints, ...) an update of the optimum position relative to the previous one may be proposed. If savings exist, this new optimum may be inserted to replace the previous optimum step point.
When an OPT STEP is inserted in the F-PLN, and the flight crew achieves a lateral F-PLN revision, the FM keeps the (OPT) along the new F-PLN at the same distance from the aircraft position, as previously determined.



Rules

- The OPT STEP is only computed by the FM if data required for the prediction computation are inserted: F-PLN, CRZ FL, CI, GW, CG at least
- The search of the OPT STEP begins 20 NM beyond T/C before cruise, or ahead of aircraft position
- The search of the OPT STEP ends 20 NM before the next STEP POINT or 300 NM before the T/D
- Only one OPT STEP is computed at a time.

Guidance

When reaching the step point, the steps must be initiated by the flight crew by selecting the new CRZ FL and pushing the FCU ALT selector knob. If sequenced without any flight crew action, the step is automatically deleted.

If the flight crew initiates the step:

- The CRZ FL is automatically reassigned to its new value
- The guidance is THR CLB/CLB for a step climb
  THR DES/DES with V/S = -1 000 ft/min for a step descent.

STEP ENTRY

The STEP ALTS page is either accessed from the:

- VERT REV page, or
- PERF CRZ page.

FOR GEOGRAPHIC STEP

PRESS the PERF key or PRESS the F-PLN key and SELECT VERT REV at a cruise waypoint. SELECT the STEP ALTS prompt.

WRITE the ALT/WPT in the scratchpad, and ENTER it in [1L] to [4L].

Note:
- *The position may be a waypoint ident, PBD, or PD*
- *The flight crew may enter FL 350/LMG/-20. The FMS will compute the geographic step 20 NM before LMG to FL 350*
- *To modify an inserted STEP:*
  - *To modify the CRZ FL only, enter it in the left key, as "FLXXX"*
  - *To modify the position only, enter it in the left key, as "/XXX"*
  - *To modify both, modify the position first, and then the CRZ FL (it is not possible to modify both in a single entry).*

CHECK the PREDICTIONS.

                        OPT STEP
<RETURN                 INSERT*
```

TO DETERMINE THE OPTIMAL STEP LOCATION WHEN THERE ARE ONLY 2 CRZ FL IN THE F-PLN

The flight crew may obtain the OPT position of the STEP point, as follows:

INSERT the initial cruise FL on INIT A page.
ENSURE that the ZFW, ZFWCG and BLOCK fuel are inserted in INIT FUEL PRED page.
WRITE the new CRZ FL in the STEP ALTS page, and INSERT it in the [1L] field.

Distance and time to optimum point and fuel/time saving are displayed.

CHECK the fuel and time savings and prediction in the [5R] field.

Savings are computed by comparing the entered step altitude, and the origin altitude of the step.

INSERT, if suitable.

MESSAGES

Messages may be displayed in the DIST/TIME field:

- “ABOVE MAX” if the inserted step altitude exceeds the MAX MAX ALT.
  The “STEP ABOVE MAX FL” scratchpad message is associated to the “ABOVE MAX” message.
- “IGNORED”

  This message is displayed in the following cases:
  - Step climb is located before the top of climb or after the top of descent
  - Step end is at less than 50 NM from top of descent. An optimum step point < 200 NM from top of descent cannot be inserted.
- “STEP NOW” if the aircraft is within 20 NM from the step point.

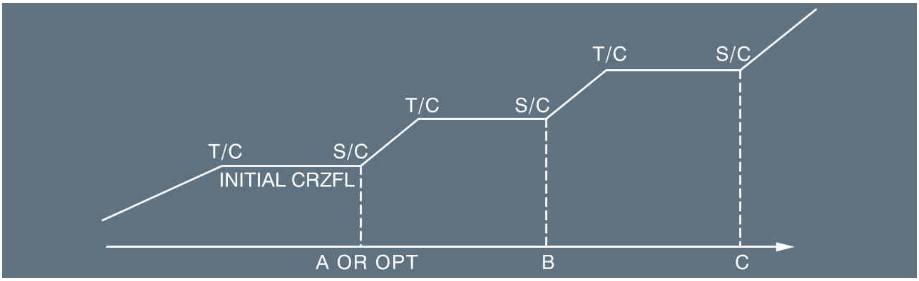
"NOT ALLOWED" may be displayed in the scratchpad if:

- Four steps already exist in the F-PLN, and an additional entry is attempted
- Any attempt to enter a step at the FROM waypoint or at a pseudo waypoint is done
- Two consecutive steps are entered at the same waypoint (e.g. step climb after step descent).

STEP CLIMB/STEP DESCENT

Ident.: DSC-22_20-60-80-00001328.0007001 / 12 APR 17
Applicable to: LV-KHT, LV-KHU

The STEP ALTS function allows to define the successive CRZ FLs and to determine the optimum position to initiate a climb from the initial (or current) CRZ FL to the next one.



PRINCIPLE

GEOGRAPHIC STEPS

Up to four geographic steps may be defined on the STEP ALTS page. These steps are initiated at a geographical position, along the F-PLN.

Rules

- The minimum step size is 1 000 ft
- A Step Climb (S/C) cannot follow a Step Descent (S/D)
- A STEP is automatically cleared:
  - If the S/C (S/D) is sequenced without any level change commanded by the flight crew.
  - If the flight crew achieves a LAT REV which deletes the associated waypoint from the F-PLN
  - By EO condition.
- A STEP is manually cleared:
  - On the STEP ALTS page, by CLEARING the corresponding field
  - On the F-PLN page, by CLEARING the (S/C) (S/D) pseudo waypoint.

- A STEP entry is IGNORED if the remaining CRZ distance is less than approximately 50 NM
- When the steps are inserted in the F-PLN, they are displayed:
  - On the MCDU as (S/C), (S/D), (T/C), (T/D) pseudo waypoints
  - On the ND by associated ↗, ↘, ↘ white symbols.

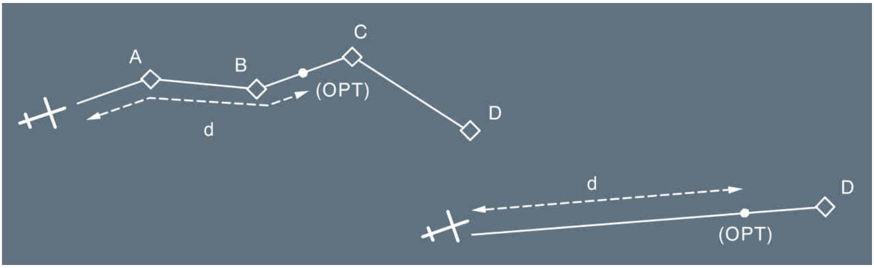
OPTIMUM STEP

When geographic steps are inserted, or an altitude is entered, the FM proposes an OPTIMUM STEP start of climb position for the first step climb altitude ahead. Predicted FUEL and TIME savings are displayed when calculated to be greater than 100 kg or 1 min respectively. If no savings are found, no optimum step is proposed.

The OPT STEP is not automatically inserted: The flight crew has to insert it if appropriate. When inserted, the OPT STEP point (OPT), is then a fixed geographical point.

If, subsequently, some F-PLN parameters are changed (winds, new waypoints, ...) an update of the optimum position relative to the previous one may be proposed. If savings exist, this new optimum may be inserted to replace the previous optimum step point.

When an OPT STEP is inserted in the F-PLN, and the flight crew achieves a lateral F-PLN revision, the FM keeps the (OPT) along the new F-PLN at the same distance from the aircraft position, as previously determined.



Rules

- The OPT STEP is only computed by the FM if data required for the prediction computation are inserted: F-PLN, CRZ FL, CI, GW, CG at least
- The search of the OPT STEP begins 20 NM beyond T/C before cruise, or ahead of aircraft position
- The search of the OPT STEP ends 20 NM before the next STEP POINT or 300 NM before the TOD
- Only one OPT STEP is computed at a time.

Guidance

When reaching the step point, the steps must be initiated by the flight crew by selecting the new CRZ FL and pushing the FCU ALT selector knob. If sequenced without any flight crew action, the step is automatically deleted.

If the flight crew initiates the step:
- The CRZ FL is automatically reassigned to its new value
- The guidance is THR CLB/CLB for a step climb
  THR DES/DES with V/S = -1 000 ft/min for a step descent.

<RETURN
```

FOR OPTIMAL STEP

When all geographical steps are inserted, and the predictions are available, the STEP ALTS page displays FUEL/TIME savings for the first step climb. If no significant savings are predicted, the NO OPTIMAL message is displayed.

```
STEP ALTS FROM FL290
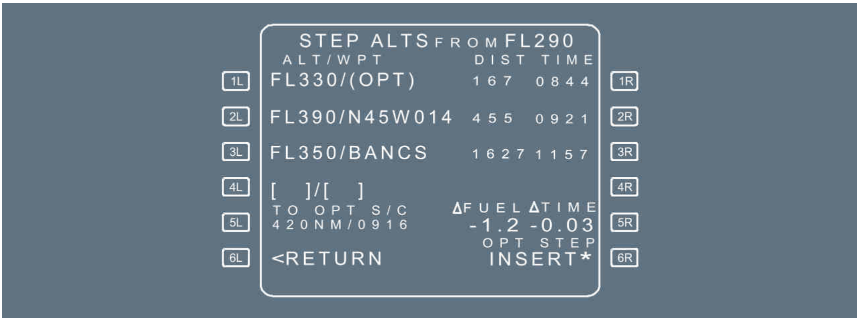
ALT/WPT              DIST  UTC
FL330/(OPT)           167  0844
FL390/N45W014    ABOVE MAX
FL350/BANCS          1627  1157
[      ]/[        ]

                      OPT STEP
<RETURN                UPDATE*
```

The computed (OPT) step replaces the initially inserted step position, and is then considered at a fixed geographic position. Savings are no longer displayed, and the UPDATE prompt replaces the INSERT prompt. This prompt allows the flight crew to update the (OPT) step position, taking into account possible F-PLN or inserted wind changes.

If pressed, a new OPT point is proposed with associated SAVINGS and INSERT prompt, or NO OPTIMAL.

UPDATE prompt has been pressed, the new OPT STEP point provides additional savings:



```
 STEP ALTS FROM FL290
  ALT/WPT            DIST TIME
FL330/(OPT)          167  0844

FL390/N45W014        455  0921

[   ]/[   ]
TO OPT S/C        ΔFUEL ΔTIME
420NM/0916         -1.2 -0.03
                    OPT STEP
<RETURN             INSERT*
```

TO DETERMINE THE OPTIMAL STEP LOCATION WHEN THERE ARE ONLY 2 CRZ FLS IN THE F-PLN

The flight crew may obtain the OPT position of the STEP point, as follows:

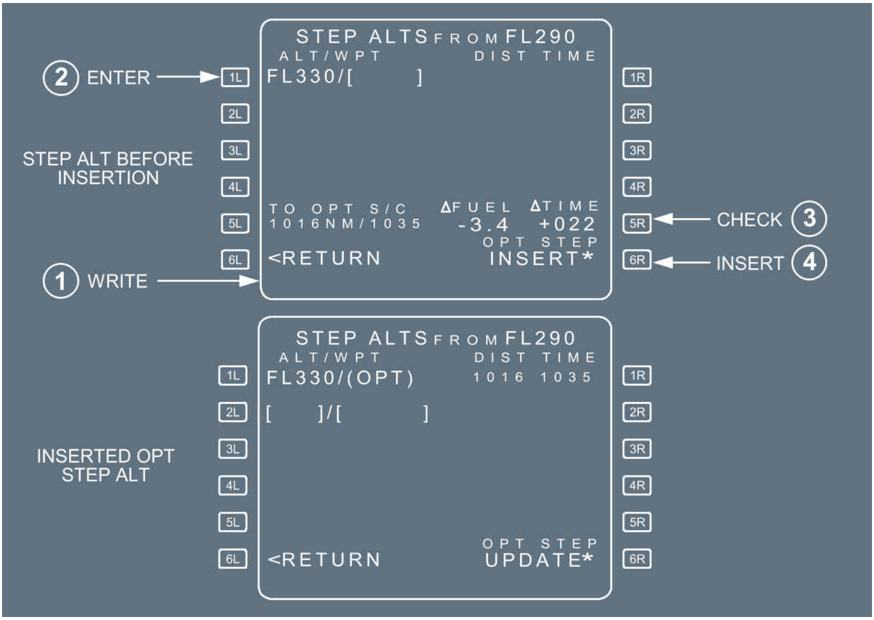
INSERT the initial cruise FL on INIT A page
ENSURE that the ZFW, ZFWCG and BLOCK fuel are inserted in INIT B page
WRITE the new CRZ FL in the STEP ALTS page, and INSERT it in the [1L] field.

Distance and time to optimum point and fuel/time saving are displayed.

CHECK the fuel and time savings and prediction in the [5R] field.

Savings are computed by comparing the entered step altitude, and the origin altitude of the step.

INSERT, if suitable.



```
STEP ALTS FROM FL290

                      OPT STEP
<RETURN               UPDATE*
```

Note: No OPT STEP is available in the SEC F-PLN.

MESSAGES

Messages may be displayed in the DIST/TIME field:

- “ABOVE MAX” if the inserted step altitude exceeds the REC MAX ALT.
  The “STEP ABOVE MAX FL” scratchpad message is associated to the “ABOVE MAX” message.
- “IGNORED”

  This message is displayed in the following cases:
  - Step climb is located before the top of climb or after the top of descent
  - Step end is at less than 50 NM from top of descent. An optimum step point < 200 NM from top of descent cannot be inserted.
- “STEP AHEAD” when the distance to the step point is less than 20 NM. A "STEP AHEAD" scratchpad message is also displayed.

“NOT ALLOWED” may be displayed in the scratchpad if:

- Four steps already exist in the F-PLN, and an additional entry is attempted
- Any attempt to enter a step at the FROM waypoint or at a pseudo waypoint is done
- Two consecutive steps are entered at the same waypoint (e.g. step climb after step descent).

GENERAL

Ident.: DSC-22_20-60-90-00001329.0002001 / 16 MAR 11
Applicable to: ALL

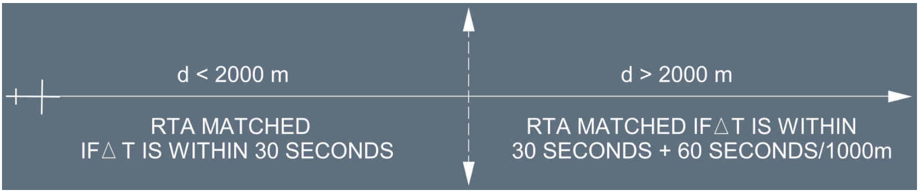
A time constraint may be assigned at any waypoint of the F-PLN, downpath of the FROM waypoint origin. It can be an ”AT”, “AT OR BEFORE”, or “AT OR AFTER” constraint.
The FM computes a new managed speed profile from the aircraft position to the constrained waypoint, in order to match the 30 s difference (ΔT) between the time predicted at the constrained waypoint and the Required Time of Arrival (RTA). This modified managed speed profile can be checked using the speed prediction, displayed for each waypoint of the F-PLN page.
The RTA function uses a speed range between Green Dot and VMO -10 (or MMO - 0.02). When the constrained waypoint is sequenced, the ECON SPD/MACH is resumed unless the constrained waypoint is located in a descent segment.

Note: 1. *The FM does not compute a new managed speed profile when a RTA is entered in the descent profile, while the aircraft is in cruise, within 40 NM from the top of descent.*
2. *The managed speed target is not modified in the climb phase to avoid changes of flight path during the climb. The managed speed profile is modified once the aircraft is in cruise phase.*

The time constraint is inserted on the RTA page. A time constraint may be inserted at any waypoint of the primary or secondary flight plan.
If an engine-out condition is detected, the time constraint is automatically deleted and an RTA DELETED message is displayed on scratchpad.
When inserted in the F-PLN, the RTA is displayed in magenta on the F-PLN page, as long as no predictions are available.

When the predictions are available, the time constraint is replaced by the new predicted time at the related waypoint, highlighted by a star (*):
- If the (*) is magenta, the time constraint is matched with the 30 s criteria
- If the (*) is amber, the time constraint is missed.

Time constraint matching criteria:



d < 2000 m
d > 2000 m
RTA MATCHED
IF△ T IS WITHIN 30 SECONDS
RTA MATCHED IF△T IS WITHIN
30 SECONDS + 60 SECONDS/1000m

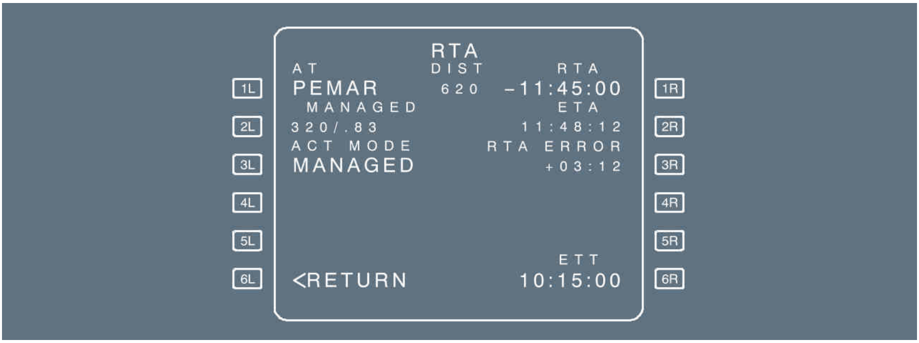
Note: *ΔT is the time difference between the time predicted at the constrained waypoint and the RTA.`*

RTA ENTRY

Ident.: DSC-22_20-60-90-00001330.0002001 / 01 OCT 12
Applicable to: ALL

PRESS the F-PLN key
SELECT vertical revision at revised waypoint
SELECT the RTA key
ENTER a waypoint at which a time constraint is to be defined
WRITE the RTA (+/– HHMMSS) into the scratchpad and ENTER by pressing the 1R key.

The display automatically reverts to the F-PLN A page.



```
                RTA
 AT             DIST          RTA
PEMAR            620    -11:45:00
  MANAGED                     ETA
320/.83                  11:48:12
ACT MODE                RTA ERROR
MANAGED                    +03:12

                              ETT
<RETURN                  10:15:00
```

Note:
- *The RTA can be cleared directly on the F-PLN A page using the CLR key.*
- *If a time constraint is inserted in the F-PLN, the OPT STEP function is no longer available. Therefore, if an OPT is to be inserted in the F-PLN, this shall be done before entering the RTA.*
- *The time constraint is automatically deleted in the following cases:*
  - *Engine Out, or*
  - *When entering a holding pattern, or*
  - *In case of go-around, or*
  - *A time constraint is entered at another waypoint while another time constraint already exists.*

In case a time constraint is deleted, the “RTA DELETED” scratchpad message is displayed.

ESTIMATED TAKEOFF TIME

Ident.: DSC-22_20-60-90-00001331.0001001 / 16 MAR 11
Applicable to: ALL

The Estimated Takeoff Time (ETT) may be entered by the pilot during the preflight phase at the origin airport. This time is used as the initialization time for predictions.
The entry is accepted in the preflight phase, if the ETT is greater than the clock time.

PROCEDURE

PRESS the F-PLN key.
SELECT a vertical revision at origin
SELECT the RTA page ◁*
WRITE the ETT into the scratchpad, and ENTER it in the UTC CSTR (ETT ◁*) field.
The display automatically reverts to the F-PLN A page.

Note:
- *If the current time exceeds the ETT entry, the CLK IS TAKE OFF TIME message is displayed ; the ETT is replaced by the clock time*
- *At takeoff, the takeoff time is automatically updated using the actual clock time*
- *An ETT entry is automatically deleted, if the origin airport is modified, or if the clock is inoperative*
- *If a time constraint is entered at a waypoint in the F-PLN, the takeoff time required to match the constraint is automatically computed by the FM. This result is displayed in magenta as ETT at the origin.*

USE OF TIME/ETT CSTR

During preflight :
- If an ETT has been entered, time predictions are based on the entered value (or clock time, if greater)
- If both an ETT and a time constraint have been entered, time predictions are based on the entered ETT value (or clock time, if greater). The managed speed profile is computed to match the time constraint, as closely as possible, using a pseudo cost index value. (Not displayed)
- If only a time constraint has been entered:
  - Optimum speeds are computed to determine the ETT, so as to satisfy the time constraint.
  - If necessary, flight time (based on optimum speeds) plus clock time (current) is greater than the time constraint. Optimum speeds are modified to match the time constraint as closely as possible.

After Takeoff : The predictions are based on the current time.
Speeds are adjusted to satisfy the time constraint.

Intentionally left blank

GENERAL

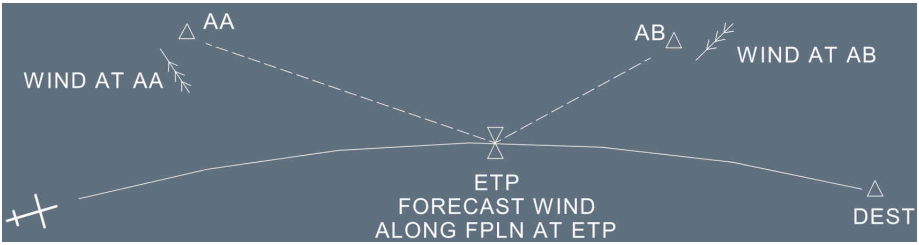
EQUITIME POINT

Ident.: DSC-22_20-60-110-00001334.0001001 / 01 APR 11
Applicable to: ALL

The EQUITIME POINT page displays the Equitime Point (ETP) computed along the F-PLN route between two referenced positions (airports, waypoints or NAVAIDs) defined by the flight crew (Refer to DSC 22_20 Auto Flight - Flight Management / 50 Controls and Indicators / 10 MCDU - Page Description).
At the first access to the page, the FM proposes origin and destination airports as defaulted positions.
The flight crew may overwrite these two positions and insert the wind in their vicinity at the applicable CRZ FL.
The FM then computes the resulting ETP, using the managed or selected speed and blending the forecasted winds along the F-PLN route with the inserted winds.

The FM provides :
- TIME and DIST from aircraft position (or origin on ground) to ETP
- The BRG/DIST from ETP to the defined positions
- TIME overhead each position, assuming the aircraft flies from present position to the defined position via the ETP
- (ETP) pseudo waypoint is displayed on the ND along the F-PLN.
- ETP location with regard to the subsequent waypoint.



ETP ENTRY

Ident.: DSC-22_20-60-110-00001335.0001001 / 16 MAR 11
Applicable to: ALL

PRESS the DATA key
SELECT the EQUITIME POINT prompt.

The EQUITIME POINT page is displayed. The origin and destination airports are used by default.

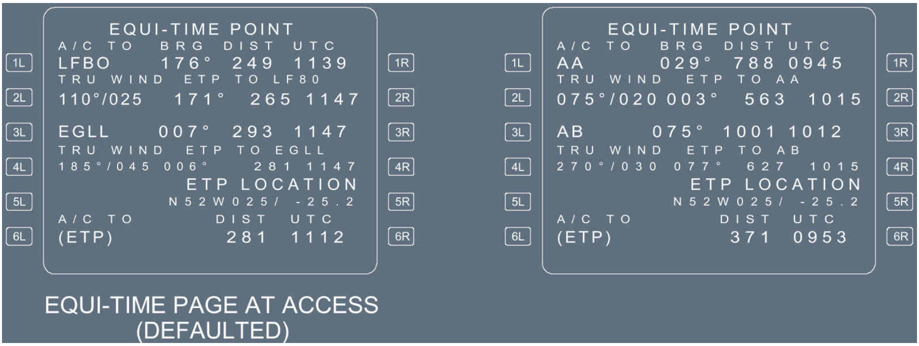
ENTER the REF POINT 1 in the 1L field.

ENTER the associated wind in the 2L field.

The wind to be inserted is the wind in the vicinity of the reference point at the CRZ FL.

ENTER the REF POINT 2 in the 3L field.
ENTER the associated wind in the 4L field.

The system displays the ETP location with regards to the next waypoint of the active flight plan following the ETP in the 5R field, and the A/C TO (ETP) predictions in the 6R field.



```
    EQUI-TIME POINT

```

EQUI-TIME PAGE AT ACCESS
(DEFAULTED)

<u>Note:</u>
- *The ETP pseudo waypoint is not displayed on the MCDU F-PLN page. In order to locate it easily, or when closing up the applicable ETP, the TIME MARKER may be used. This allows the flight crew to visualize ETP pseudo waypoint in advance on the F-PLN page or to prepare the next applicable ETP on the EQUITIME POINT page.*
- *The ETP is computed using speed according to current mode (managed or selected).*

CLOSEST AIRPORTS

Ident.: DSC-22_20-60-110-00001336.0001001 / 01 APR 11
Applicable to: ALL

The CLOSEST AIRPORT page displays the 4 closest airports from the aircraft position found in the navigation database (Refer to DSC 22_20 Auto Flight - Flight Management / 50 Controls and Indicators / 10 MCDU - Page Description) and the fifth airport, as selected by the flight crew.

For each airport, the FM computes :

- The BRG/DIST/ESTIMATED UTC from aircraft position to the corresponding airport
- The EFOB at the airport, assuming an EFFECTIVE WIND (defaulted or entered by the flight crew).

LIST FROZEN
<RETURN

CLOSEST AIRPORTS PAGE 2

Note: *When CLOSEST AIRPORTS, page 2, is selected, the list of airports is automatically frozen, as indicated on the page.*

The FUEL/TIME predictions to the closest airports use simplified assumptions :

- Manage speed profile in cruise, with the effective wind from the CLOSEST AIRPORT page 2. In case of EO, Engine Out condition is considered.
- Continuous descent from CRZ FL down to the airport elevation.

Note: *In case SELECTED SPD is used, the CLOSEST AIRPORT page still provides good use to choose the applicable closest airport for diversion purposes. However, when SELECTED SPD is significantly different from MANAGED SPD, the predictions in terms of time and fuel must be disregarded since they are misleading.*
The predictions may then be checked on the SEC F-PLN.

HOW TO EXECUTE A DIVERSION

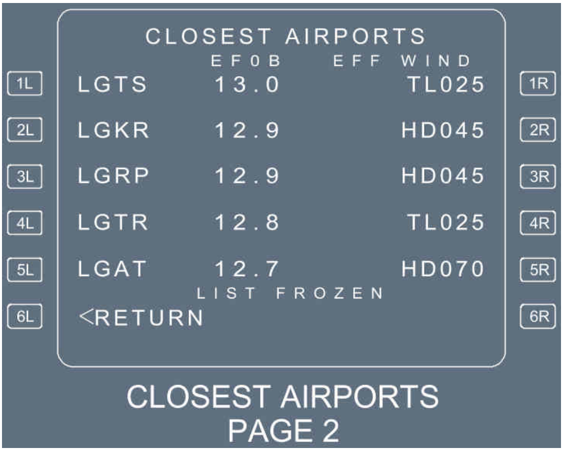
Ident.: DSC-22_20-60-110-00001337.0001001 / 10 DEC 09
Applicable to: ALL

Various features are provided to the flight crew in order to execute a diversion :
- The EQUITIME POINT
- The CLOSEST AIRPORTS page
- The SECONDARY F-PLN
- The ENABLE ALTN function
- The NEW DEST revision.

EN ROUTE DIVERSION WITH SEVERAL AIRPORTS AVAILABLE

Ident.: DSC-22_20-60-110-00001338.0001001 / 10 DEC 09
Applicable to: ALL

SELECT the CLOSEST AIRPORTS page.



```
        CLOSEST AIRPORTS
              EFOB     EFF  WIND
LGTS          13.0           TL025

            LIST FROZEN
<RETURN
```

CLOSEST AIRPORTS
PAGE 2

SELECT the EFOB/WIND prompt.
INSERT the effective wind at selected airport.
CHECK the predictions and CHOOSE the adequate diversion airport.

PREPARE the diversion flight plan on the secondary flight plan.

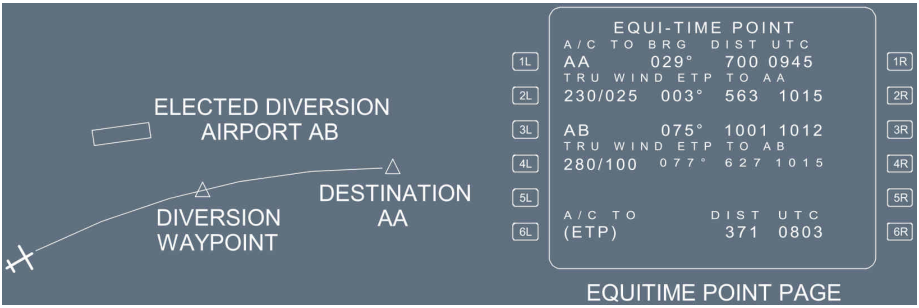
Note: *Fuel/time predictions on CLOSEST AIRPORTS page assume managed speed profile.*

EN ROUTE DIVERSION OVER OCEANIC OR DESERTIC AREA

Ident.: DSC-22_20-60-110-00001342.0001001 / 10 DEC 09
Applicable to: ALL

The diversion airports are usually determined prior to departure or using the CLOSEST AIRPORT DATA.

SELECT the EQUITIME POINT page.



```
       EQUI-TIME POINT
A/C  TO  BRG    DIST  UTC
AA       029°    700 0945
TRU  WIND  ETP  TO  AA
230/025   003°   563  1015

AB        075°   1001 1012
TRU  WIND  ETP  TO  AB
280/100   077°   627  1015

A/C  TO          DIST  UTC
(ETP)             371  0803
```

EQUITIME POINT PAGE

ENTER the airport idents in the 1L and 3L fields.
ENTER the associated winds in the 2L and 4L fields.
CHECK the ETP position and time.
ENTER a predicted time at ETP as a time marker.
PREPARE a diversion flight plan on the secondary flight plan.

DIVERSION PREPARATION ON THE SECONDARY FLIGHT PLAN

Ident.: DSC-22_20-60-110-00001343.0001001 / 16 MAR 11
Applicable to: ALL

This procedure shall be applied for all diversion cases, when the diversion airport has been selected, and when the “most probable diversion point of the F-PLN” has been selected.

SELECT the “SEC F-PLN” key.
PRESS the “COPY ACTIVE” prompt.
SELECT a lateral revision at diversion waypoint.

ENTER the ident of the diversion airport as the new destination (NEW DEST field).

Then finalize the flight plan between the diversion point and the diversion airport. If the diversion airport is no longer applicable or the ETP is sequenced, repeat the same procedure for the next diversion airport.

MISCELLANEOUS

Ident.: DSC-22_20-60-110-00001344.0001001 / 17 MAR 11
Applicable to: ALL

In certain cases, the diversion airport may be simply chosen using the airports displayed on ND having selected AIRPORT on the EIS control panel.

During oceanic or desertic area flights, the PROG page may be advantageously used as follows :

ENTER the ident of the diversion airport in the 4R field of MCDU 1.
ENTER the next diversion airport in the 4R field of MCDU 2.

The flight crew is then continuously provided with the instantaneous BRG/DIST to the selected diversion airports.

UPDATE the PROG pages when sequencing the ETP.

EXECUTION OF THE DIVERSION

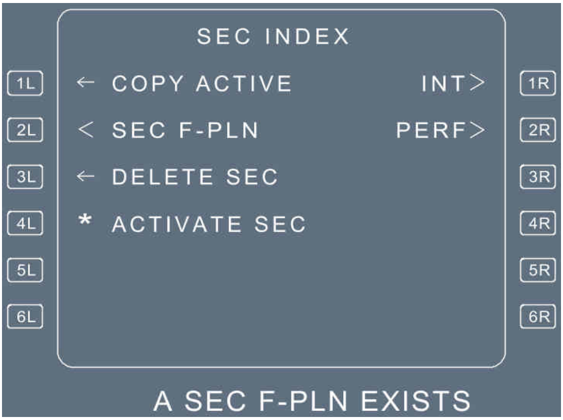
Ident.: DSC-22_20-60-110-00001345.0001001 / 10 DEC 09
Applicable to: ALL

- **When the flight crew decides to divert :**

  PRESS the SEC F-PLN key.

  SELECT the ACTIVATE SEC prompt.

SELECT DIR TO required point.



SEC INDEX

← COPY ACTIVE INT>

< SEC F-PLN PERF>

← DELETE SEC

* ACTIVATE SEC

A SEC F-PLN EXISTS

DIVERSION TO THE ALTERNATE AIRPORT

Ident.: DSC-22_20-60-110-00001346.0001001 / 24 NOV 23

Applicable to: ALL

The primary F-PLN includes an alternate flight plan from destination to the preferred alternate airport. All fuel prediction and management (XTRA fuel) take into consideration the alternate flight plan.
If the crew decides to divert at the end of the cruise, or beyond the last ETP, or in descent or Go-around phases, this will be done most probably to the alternate airport.

- **When the crew decides to divert :**

  SELECT a lateral revision at suitable waypoint

  SELECT ENABLE ALTN

  CHECK the temporary flight plan and INSERT.

  SELECT DIR TO required waypoint.

  Note:
  - *In most cases the LAT REV shall be selected at the TO WPT. This will facilitate the subsequent selection of the DIR TO waypoint.*
  - *The ALTN flight plan shall be finalized whenever the landing runway is known by the crew (before arrival briefing).*
    This will ensure, in most cases, to have the most probable flight plan displayed on the MCDU once ENABLE ALTN is selected.

Intentionally left blank

IRS ALIGNMENT

Ident.: DSC-22_20-60-120-00001347.0001001 / 21 MAR 17
Applicable to: ALL

IRSs will be aligned, as per the recommendations in the SOP chapter (*Refer to PRO-NOR-SOP-04 ADIRS*).

F-PLN INSERTION AND CROSSCHECK

Ident.: DSC-22_20-60-120-00001348.0001001 / 16 MAR 11
Applicable to: ALL

On certain routes, the pilot has to define LAT/LONG waypoints, which must be entered as follows:

WRITE the waypoint longitude/latitude in the scratchpad.

The format is 4500N/3000W.

PRESS a left key of the MCDU F-PLN page.

This automatically triggers the NEW WAYPOINT page.

CHECK the coordinates and the proposed waypoint ident.

If the pilot entered 4500N/3000W, the system proposes the ident N45W030.

PRESS the STORE prompt.

The waypoint is inserted in the F-PLN, and stored in the navigation database (stored element).

A F-PLN crosscheck must be carefully performed by both crewmembers:

- *Check the SID (F-PLN page and ND PLAN mode versus the SID chart including constraints)*
- *En route segments:*
  - *If the F-PLN is defined by a company route: Check the ROUTE SELECTION page, versus the ATC F-PLN.*
  - *If the F-PLN is defined by a succession of airways: Check the AWY intersect waypoints on the AWY page, versus the ATC F-PLN.*
  - *If the F-PLN is defined by a succession of waypoints: Check the TRK/DIST of each leg, versus the computerized F-PLN.*
- *Check the flight plan DISTANCE on the F-PLN page, versus the ground distance of the computerized flight plan*
- *Once the flight plan is finalized, and all GW/PERF data are inserted:*
  - *PRINT the PREFLIGHT REPORT*
    This report may then be used as the master document for the continuous monitor of the flight progress, until a major flight plan change will occur in flight.

IN FLIGHT PROCEDURES

Ident.: DSC-22_20-60-120-00001351.0001001 / 23 DEC 14
Applicable to: ALL

TAKEOFF

If takeoff is achieved from an intersection, INSERT the corresponding TO SHIFT on the PERF TO page, to get an accurate position update at takeoff.

REACHING THE INITIAL CRUISE FL

COMPLETE WIND/TEMP entry at waypoints, if not done during preflight
COMPLETE STEP entry, check whether an OPT STEP is proposed for the next STEP on the STEP ALT page
UPDATE the F-PLN with the latest ATC or Oceanic clearance
PRINT the resulting predictions (if PRINTER is installed) : PRINT the INFLIGHT REPORT

This will be then used as the basic document to follow the proper completion of the flight, until a new major change is requested by ATC.

BEFORE LEAVING RADIO NAVAID COVERAGE

TUNE the last NAVAID within range and INSERT its ident on PROG page.

- **When IRS ONLY NAVIGATION message comes up :**
  VALIDATE FMS position (raw data versus computed BRG/DIST on PROG page)
  - **If a significant deviation is noticed between the IRS deviations :**
    Determine the best 2 IRSs on DATA POS MONITOR page

    eg
    IRS1 IRS 2 IRS3
    6.4 2.8 2.5 IRS 3/IRS2 are best.

OUTSIDE RADIO NAVAID COVERAGE

USE NAV mode.
KEEP FD bars displayed on both PFD.

Any FMS position mismatch is immediately detected by the FD bars of the slave FMS, which will not be properly centered.

When close to the TO waypoint : SELECT the report page
When overhead the waypoint, CHECK the proper sequencing :

- *REPORT to ATC using REPORT page*
- *CHECK BRG/DIST to the new TO WPT on the ND*
- *CHECK Fuel and Xtra on FUEL PRED page*

MODIFICATION OF THE F-PLN

PM : ENTERS the new clearance in the MCDU
PF/PM : CROSSCHECK the correct insertion of the new clearance
PRINT the resulting predictions (PRINTER <*) : INFLIGHT REPORT

The previous print may be suppressed since the new print includes the history of the past waypoints.

WHEN BACK INTO RADIO NAVAID COVERAGE AREA

Manually TUNE for display the first navaid potentially in range

Note: *Autotune of the navaid will only occur when within the figure of merit of the navaids.*

CROSSCHECK FMS accuracy whenever raw data are available

Note: *If a VOR/DME update occurs, it is quite common to note that the aircraft enters a shallow turn to slowly catch up the new radio position.*

AT THE END OF THE FLIGHT

PRINT the POST FLIGHT REPORT (if the PRINTER is installed).

Note: *When taxiing, the GS information provided by the worst IRS might be misleading*

CHECK the IRS drift on the POST FLIGHT REPORT or on the IRS MONITOR page (if printer is not installed)

Intentionally left blank

GENERAL

Ident.: DSC-22_20-60-130-00001352.0001001 / 22 MAR 16
Applicable to: ALL

When a flight is scheduled to cross high latitude areas (beyond 60 °), the flight crew must take various precautions regarding ADIRSs, FMGESs, and EIS.

These precautions are based on:
- The change from the MAG to TRUE heading (track) reference, due to the airway reference changes in high latitude, or due to the IRSs unable to provide magnetic heading.
- Some particularities due to the pole overfly.

DESCRIPTION

Ident.: DSC-22_20-60-130-A-00001353.0001001 / 27 MAY 13
Applicable to: ALL

MAG-TRUE REFERENCE SELECTION:

The MAG/TRUE selection is achieved manually by pressing the NORTH REF pb.

Note: *1. All airfields where STARs and APPRs are MAG referenced — such as Svalbard — will be flown with magnetic reference selected.*
2. Although located outside the above polar zone, Thule is "TRUE" oriented.

Ident.: DSC-22_20-60-130-A-00001354.0002001 / 03 NOV 21
Applicable to: ALL

FMGES

- Flight Guidance part
  - When the flight crew manually changes the heading reference from MAG to TRUE or vice versa:
    - If NAV mode is engaged, there is no discontinuity in the lateral guidance
    - If HDG (TRK) modes are engaged, the HDG (TRK) target is automatically modified using current position variation; thus there is no discontinuity in the lateral guidance.
  - When TRUE reference is selected, only CAT I ILS approaches may be flown.
- Flight Management part
  - When the aircraft reaches 78 N (60 S), the aircraft position is computed using XYZ earth centered Cartesian coordinates.
    This allows the FM to continuously provide, regardless of latitude, a MIX IRS position, the FM position being linked to the MIX IRS one.
  - During preflight phase, if TRUE reference is selected (take off with TRUE reference is rare), the pilot is reminded of this selection by:
    - CHECK NORTH REF message on ND and MCDU scratchpad if the origin airport reference does not match the one selected by the pilot
    - TRUE label above PFD/ND heading scales flashes for 10 s at slat extension
    - TRUE NORTH REF memo message flashes for 10 s at engine start or at slat extension.
  - Before approach, the flight crew is reminded of the correct TRUE/MAG selection by:
    - CHECK NORTH REF message on ND and MCDU scratchpad if the destination airport reference in data base does not match the one selected by the flight crew and the aircraft reaches the arrival area (approximately 25 NM from destination airport)
    - If true is selected, TRUE label pulses on PFD/ND during 10 s at slat extension, as well as the TRUE NORTH REF message on ECAM (as a reminder).

    Note: *If the flight crew selects TRUE reference whereas the selected approach is defined in MAG reference in the FM navigation data base, the NAV mode will disengage at the entry into the approach procedure.*

  - The tracks and bearings, provided on the MCDU F-PLN, PROG, etc. pages are computed TRUE or MAG referenced, according to the TRUE/MAG cockpit selection
    - If selection is TRUE, the bearing and track figures are displayed followed by a T.
  - If the flight crew wishes to create a PBD or a PB/PB waypoint or define a radial (DIR TO INTCPT), the rule for bearing or radial entry is as follows:
    - If the bearing is inserted without specifying its reference, the reference is the one corresponding to the cockpit selection

- If the bearing is inserted with its specified reference (M for magnetic, T for true), the bearing is so defined : e.g. TOU/350T/15.

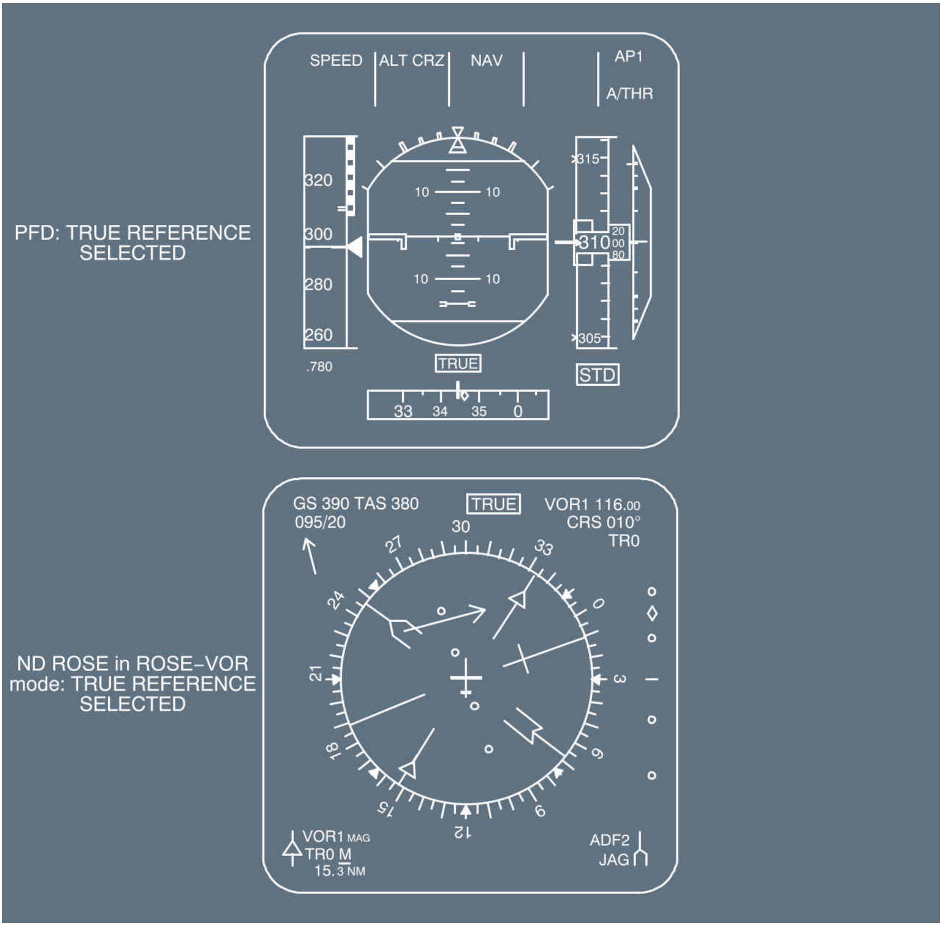
Ident.: DSC-22_20-60-130-A-00001355.0003001 / 27 MAY 13
Applicable to: ALL

EIS PFD/ND

TRUE/MAG REFERENCE INDICATION

The TRUE/MAG reference selection is indicated by a specific label displayed above the heading scales of both EFIS DUs:

- If MAG is selected (which is the most common situation) no label is provided ; the bearing to the TO waypoint on the ND is displayed with the digits only.
- If true is selected, a TRUE label is provided above PFD/ND heading scales.



PFD: TRUE REFERENCE SELECTED

ND ROSE in ROSE–VOR mode: TRUE REFERENCE SELECTED

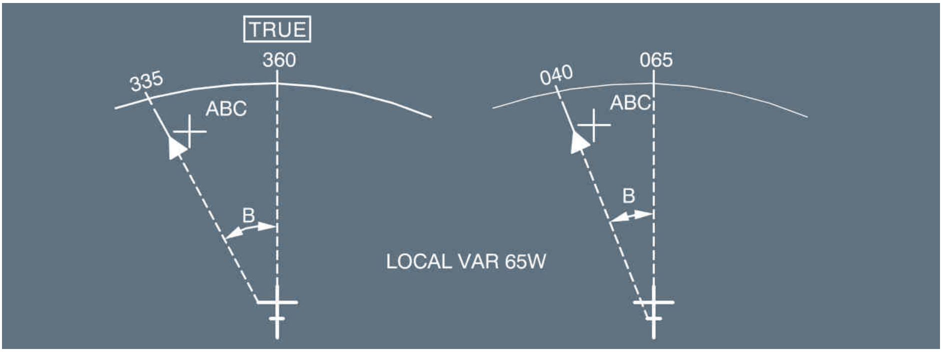
Applicable to: LV-GKO, LV-GKP

ADF AND VOR BEARING DISPLAY

- The ADF relative bearing information (B) is thus independant of the TRUE/MAG selection, and the needle is always pointing to the same direction whatever is the selection.
  Furthermore (provided FM position is accurate) when the EFIS ND is in ARC or ROSE NAV modes, the ADF needle will point towards the NDB symbol as provided by the FMS.



Note: *the same reading is available on the DDRMI.*

- The VOR bearing is measured by the VOR, at the VOR location:
  - it is a TRUE bearing, if the VOR station is TRUE-referenced.
  - it is a MAG bearing, if the VOR station is MAG-referenced.

  When the ND display mode is ARC or ROSENAV, the FM-computed data (aircraft position, F-PLN legs, NAVAID position symbol...) are provided along with VOR needles, if selected.

  → it is important, in these display modes, that the FM data and the VOR raw data be consistent.
  Hence, if the cockpit NORTH REF selection does not match the VOR station reference, there may be a discrepancy between the VOR raw data and the FM data, unless a correction is applied to the VOR data.

PRINCIPLE

When the ND is in ARC/ROSE NAV mode, if there is a mismatch between the NORTH REF selection and the VOR station reference, the VOR needle is equal to the VOR raw bearing corrected by the local variation at the aircraft's present position.
In that case, the needle is displayed in magenta colour, the label CORR (corrected) is displayed in magenta in the lower corner of the ND.
In all other ND display modes (ROSE VOR, ROSE ILS), the VOR raw data (with no correction) is displayed. MAG or TRUE (amber) is displayed next to the VOR identifier, when its reference does not match the cockpit selection.

DDRMI

The heading provided by the DDRMI is directly linked to the NORTH REF cockpit selection.

The VOR bearing indications are raw data, as provided by the station.

PROCEDURES - FLIGHT

Ident.: DSC-22_20-60-130-00001359.0003001 / 23 DEC 14
Applicable to: LV-GKO, LV-GKP

FLIGHT

TAKEOFF:

If the “CHECK NORTH REF” amber message comes up on the ND and MCDU, verify that the NORTH REF selection matches the origin airport reference.

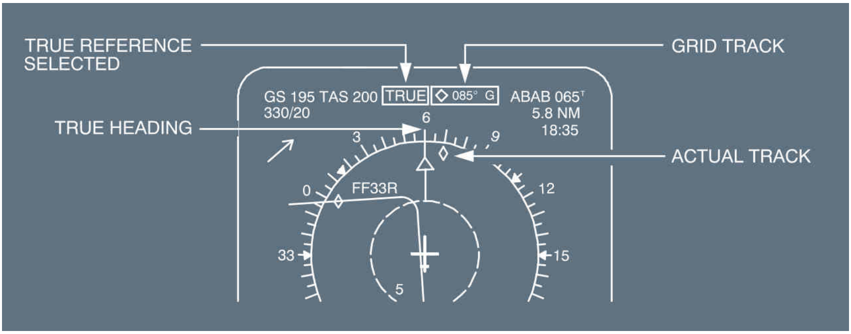
Note: *The “CHECK NORTH REFERENCE” amber message and the associated alerts are dependant of a correct coding of the airport North reference (TRUE/MAG) in the navigation database. The runway orientation displayed on ND is also affected if the airport North reference is not correctly coded.*

CRUISE:

When reaching an area where the heading reference should be changed (oceanic area, airway or polar track defined in TRUE reference ...);

SELECT TRUE by pressing the NORTH REF pushbutton.

When reaching 65 N with TRUE reference selected, the GRID TRACK is provided on the ND's upper right box. The ND compass still displays true track and heading.
GRID TRK along with XTK are the cues to be used to monitor the proper lateral guidance.



If the “SELECT TRUE” message appears on the ND/MCDU, this indicates that the aircraft has reached the Polar zone with MAG reference still selected in the cockpit. Press the NORTH REF pushbutton to select TRUE.

- *Use of VOR/DME*
  En route, the VOR/DME are basically used for either FM NAV ACCY crosscheck, or to report to ATC on a given radial.
  The FM NAV ACCY crosscheck is achieved, as usual, by comparing the bearing/distance displayed on the ND with the bearing/distance displayed on the PROG page.
  In case the VOR used is defined in another reference (e.g MAG) than the one selected in the cockpit (e.g. TRUE), the bearing provided on ND is magenta and is corrected; the VOR corrected bearing should be within 5 ° of the FM-computed bearing (taking into consideration the meridian convergence and the difference of magnetic variation).
  → *If there is a doubt, select the NORTH REF to the VOR reference, and check the bearings.*

CAUTION	*The correction of VOR indications in ROSENAV or ARC ND modes depend on a correct navigation database coding. If the North reference (TRUE/MAG) that is coded for the VOR orientation is not correct, the VOR indication correction will be unduly applied.* *If VOR needles are in magenta (CORR), check both the aircraft NORTH REF selection and the VOR station orientation on the navigation charts.*

If the aircraft has to report on a given radial of a VOR, which is defined in a different reference (e.g MAG) from the cockpit reference (e.g. TRUE), check the RADIAL crossing on the PM ND set to ROSE VOR mode or use DDRMI e.g.: aircraft flies NCA 24. (NCA 24 is TRUE referenced route). ATC requests the aircraft to report on RADIAL 357 from YZF (MAG-referenced).

- Use of ADF
  The Polar Zone NDBs are quite powerful, and the bearing can be received at long distances.
- USE these NDBs to check the reasonableness of the FM navigation by comparing the ADF bearing, that is displayed on the ND, with the FM-computed bearing, that is displayed on the PROG page

- Flying the pole
  - In most cases, the autopilot will be in NAV mode.
    When approaching the pole, a CHECK HDG message appears, with the associated ECAM Procedure.
    - ■ Disregard the ECAM Procedure.
      The message is due to the fact that the IRSs do not reach the pole simultaneously; thus the headings do not turn simultaneously from 360 to 180 °.
  - in case HDG mode is used (e.g FM 1 + 2 failed and Back Up NAV is used)
    - ■ The autopilot onside the best IRS is to be engaged.
      The offside HDG bug (▿) should be disregarded when close to the pole since, the IRS headings may differ.
- Approach
  - If CHECK NORTH REF amber message comes up on ND and MCDU, verify that the NORTH REF pusbutton is selected to the destination airport reference.

    Note: *The “CHECK NORTH REFERENCE” amber message and the associated alerts are dependant of a correct coding of the airport North reference (TRUE/MAG) in the navigation database. The runway orientation displayed on ND is also affected if the airport North reference is not correctly coded.*
  - If TRUE is selected for approach, only CAT I ILS may be flown.

CAUTION	*The correction of VOR indications in ROSENAV or ARC ND modes depend on a correct navigation database coding. If the North reference (TRUE/MAG) that is coded for the VOR orientation is not correct, the VOR indication correction will be unduly applied.* *If VOR needles are in magenta (CORR), check both the aircraft NORTH REF selection and the VOR station orientation on the navigation charts.*

If the aircraft has to report on a given radial of a VOR, which is defined in a different reference (e.g MAG) from the cockpit reference (e.g. TRUE), check the RADIAL crossing on the PM ND set to ROSE VOR mode. (EX: aircraft flies NCA 24): (NCA 24 is TRUE referenced route). ATC requests the aircraft to report on RADIAL 357 from YZF (MAG-referenced).

- Use of ADF
  The Polar Zone NDBs are quite powerful, and the bearing can be received at long distances.

USE these NDBs to check the reasonableness of the FM navigation by comparing the ADF bearing, that is displayed on the ND, with the FM-computed bearing, that is displayed on the PROG page.

- *Flying the pole*
  - *In most cases, the autopilot will be in NAV mode.*
    When approaching the pole, a CHECK HDG message appears, with the associated ECAM Procedure.

    ■ *Disregard the ECAM Procedure.*
    The message is due to the fact that the IRSs do not reach the pole simultaneously; thus the headings do not turn simultaneously from 360 to 180 °.
  - *in case HDG mode is used (e.g FM 1 + 2 failed and Back Up NAV is used)*

    ■ *The autopilot onside the best IRS is to be engaged.*
    The offside HDG bug (▿) should be disregarded when close to the pole since, the IRS headings may differ.
- *Approach*
  - *If CHECK NORTH REF amber message comes up on ND and MCDU, verify that the NORTH REF pusbutton is selected to the destination airport reference.*

    Note: The "CHECK NORTH REFERENCE" amber message and the associated alerts are dependant of a correct coding of the airport North reference (TRUE/MAG) in the navigation database. The runway orientation displayed on ND is also affected if the airport North reference is not correctly coded.
  - *If TRUE is selected for approach, only CAT I ILS may be flown.*

Intentionally left blank

LOSS OF ONE IRS

Ident.: DSC-22_20-60-140-00001360.0001001 / 03 NOV 22
Applicable to: ALL

- Consequences
  - 2 IRS/2 FMGECs available
  - MIX IRS position of each FMGEC = its onside IRS position
- Limitations
  None

Note: *If FMS 1/FMS 2 POS DIFF message comes up, check the IRSs position. If they differ by more than 20 NM prior entry into NAT-HLA area, consider a diversion.*

PROCEDURES

APPLY ECAM procedure (ATT/HDG switching if required)
DETERMINE the best IRS
USE the AP associated to the best IRS.

LOSS OF TWO IRSS

Ident.: DSC-22_20-60-140-00001361.0001001 / 03 NOV 22
Applicable to: ALL

- Consequences:
  - 1 IRS/2 FMGEC are still available. One navigation system available only
  - No AP/FD/ATHR
  - EFIS display on SINGLE SOURCE.
- Limitation
  - If the aircraft is not yet in NAT-HLA area, do not enter.
  - If the aircraft is within NAT-HLA area, continue but advise ATC of navigation degradation.

PROCEDURES

APPLY ECAM procedure
FLY the aircraft manually (ALTN LAW – PROT LOST)

In order to recover EIS display on both sides, select EIS DMS switching to DMC 1(2) EFIS SINGLE SOURCE message is displayed on PFD

SELECT TRK/FPV : adjust FCU TRK target so as to keep XTK = 0.0

Specifics for Long Range

APPLY the normal procedures except those linked to unavailability of NAV mode
When closing up the TO WPT: READ the OUTBND TRK the NEXT WPT

When sequencing the waypoint, SELECT the OUTBND TRK on the FCU, and fly the FPV to the TRK symbol on the horizon.

Note the TIME – GS – FOB when overhead.

ENVISAGE plotting technic on the chart at mid point of the leg.

LOSS OF ONE MCDU

Ident.: DSC-22_20-60-140-00001362.0001001 / 17 MAR 11
Applicable to: ALL

- Consequences
  3 IRSs, 2 FMGECs, 2 MCDUs are still available

  Note: MCDU 3 is not able to achieve the Back Up navigation.
- Limitation
  None

PROCEDURE

SELECT the failed MCDU off. The MCDU 3 automatically replaces it.

LOSS OF ONE FMGEC

Ident.: DSC-22_20-60-140-00001363.0001001 / 17 MAR 11
Applicable to: ALL

- Consequences
  - 3 IRSs/1 FMGEC/2 MCDUs are still available
  - Back up navigation is available on the failed side.
- Limitation
  None

PROCEDURES

CHECK BACK UP NAV function is available on the failed side
SELECT MCDU MENU page
PRESS NAV B/UP prompt and check that the F-PLN is displayed on the MCDU and ND
SELECT MCDU MENU page back and deselect the NAV B/UP prompt.
SELECT FM SOURCE switch to BOTH ON 1 or 2 position (ECAM procedure)
SELECT the AP associated to the live FMGEC

APPLY normal procedures

Note: *If the FM fails on the master FG side with NAV mode engaged, the AP disengages ; the FD reverts to HDG (TRK) and SPD target reverts from managed to selected. Engage the other AP, NAV mode and SPD managed. Both PFD display the same FD (1FD1 or 2FD2 is displayed).*

LOSS OF TWO FMGECS

Ident.: DSC-22_20-60-140-00001364.0001001 / 03 NOV 22
Applicable to: ALL

- Consequences
  - 3(2) IRSs/2 BACKUP NAV still available
  - No AP/FD managed modes
  - No managed target speed or Mach.
- Limitation

  None: there are still two independant navigation systems.

Note: *IRS positions must be monitored closely. If they differ by more than 20 NM prior entry into NAT-HLA area, diversion might be envisaged.*

PROCEDURES

CHECK/SELECT FM SOURCE selector to NORMAL
SELECT NAV B/UP on both MCDU MENU pages
SELECT NAV on both RMPs
SELECT TRK/FPA and try to engage one autopilot in TRK/ALT mode. (If the 2 FGs are available, engage the autopilot onside of the best IR)
SELECT proper speed/Mach target and engage A/THR
REFER to BACK UP NAV operation (*Refer to DSC-22_20-60-150 General*)
Specifics for Long Range : USE TRK mode to keep XTK = 0.0 on the BEST IRS side.

● **When closing the TO WPT:**

READ the OUTBND TRK to the NEXT WPT

COMPARE backup navigation F-PLN distance to the NEXT WPT with the computerized F-PLN

When sequencing the WPT, SELECT the OUTBND TRK on the FCU and note : Time – GS – FOB when overhead

ENVISAGE plotting technic on the chart at mid point of the leg.

FMS 1/2 INDEPENDENT OPERATIONS

Ident.: DSC-22_20-60-140-00001365.0001001 / 16 MAR 11
Applicable to: ALL

- Consequences
  - no crosstalk between both FMGECs : they work independently
  - Any entry on one MCDU must be achieved on the other one
  - No monitoring between both FMGECs
- Limitation
  None

PROCEDURES

APPLY the normal procedures, but all entries have to be duplicated
Both pilots have to MONITOR separately each FMGEC (especially in terms of navigation accuracy).

Note: *If the active F-PLN legs are different in both FMGECs, the flight director bars will only be centered on the engaged autopilot side.*
If the autopilot is then changed, the aircraft will turn towards the active leg of the other FMGEC.

GENERAL

Ident.: DSC-22_20-60-150-00001366.0003001 / 30 AUG 18
Applicable to: ALL

The MCDU NAV B/UP allows to link a MCDU to its associated IRS in order to allow the pilot to monitor the navigation and to be provided with some basic flight planning functions in some failure cases.

CAUTION	The MCDU NAV B/UP is to be used in case of FM 1 + 2 failure. It can be selected temporarily in case of FM 1 or 2 only failure, in order to ensure that the function is available on the failed side. When in MCDU NAV B/UP on both sides, one FG at least must be available to engage AP and A/THR.

In some particular failure cases where "MAP NOT AVAIL" message is permanently displayed on both ND, NAV B/UP may be used to recover the aircraft position. In this case the flight crew may attempt a manual FM reset (one after the other), then:

- If "MAP NOT AVAIL" message is still displayed, the consultation of the POSITION MONITOR page will allow to check IRS position and/or RADIO/GPIRS position,
- If IRS position and/or RADIO/GPIRS position are valid, the flight crew can activate the NAV B/UP.

The MCDU NAV B/UP function provides :
- aircraft position using onside IRS or IRS 3
- F-PLN as memorized in the MCDU
- F-PLN display on ND
- F-PLN automatic sequencing
- AP/FD selected modes, if at least one FG is available
- Limited lateral revisions
- MAG (True) bearing depending on the pilot selection, from aircraft position to the TO WPT and associated distance
- True track between waypoints
- Time estimates computed with current GS from onside IRS
- Total time and distance to destination

The following features are not provided :

- No DATA BASE available :
  - No autotuning, NAVAIDS must be selected on RMP
  - No radio position, no GPS position
  - No EFIS CTL PANEL options
  - No LDG ELEV (must be manually selected on overhead panel)
- No performance data:
  - No CLB/DES/APP NAV/FINAL modes
  - No SPEED MANAGED
  - No automatic SPD/MACH change over
- Most of predictions are lost:
  - No EFOB
  - No XTRA
  - No ETA at DEST
- No multiple lateral F-PLN
- No AP/FD managed modes
- No crosstalk between MCDUs : F-PLN revisions have to be achieved on both MCDUs.

BACK UP NAV OPERATION

Applicable to: ALL

Ident.: DSC-22_20-60-150-A-00001367.0001001 / 07 NOV 22

FM F-PLN DOWNLOAD IN MCDU

While BACK UP NAV is not active, the FM downloads permanently a condensed form of the F-PLN in the MCDU.

Downloaded information include :

- waypoint position
- waypoint identifier
- leg type
- discontinuity
- overfly
- turn direction

Heading legs, course to fix legs, ..., computed INTCPT positions, pseudo waypoints, ..., cannot be downloaded.
They are replaced by discontinuities.
Maximum of 150 waypoints are downloaded.

Ident.: DSC-22_20-60-150-A-00001368.0002001 / 16 MAR 11

DOWNLOAD B/UP F-PLN

-CF LEGS ARE PRECEDED BY A DISCONTINUITY

-PSEUDO WPT ARE NOT DOWNLOADED

In that procedure, all the legs are coded as CF (Course to Fix) legs. This explains all the discontinuities resulting in the B/UP F-PLN.
These discontinuities may be cleared.

- **When the second FM fails**

  REENGAGE and SELECT the required AP and A/THR modes (if disconnected).

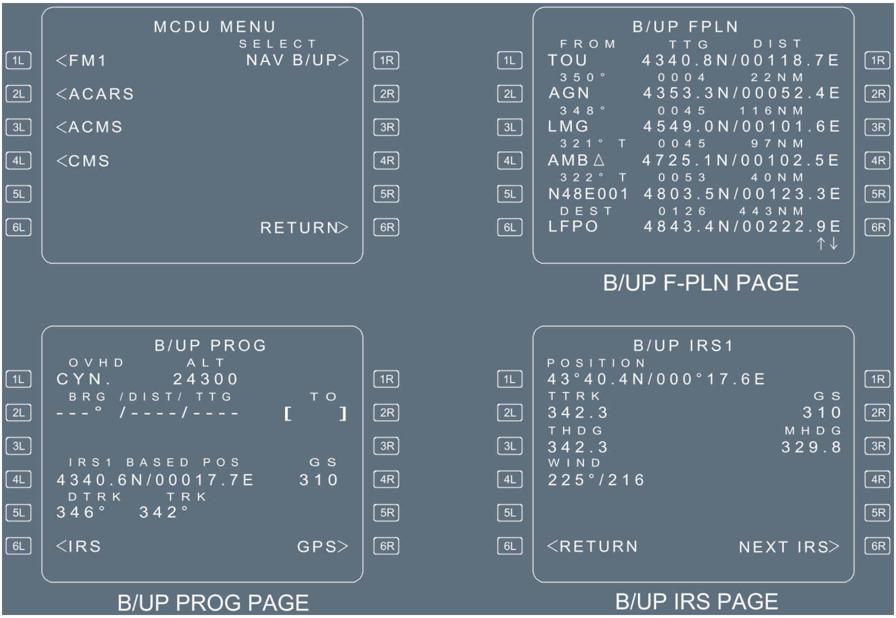
  SELECT the FM SOURCE SELECTOR to NORM

  MCDU MENU page is automatically displayed.
  NAV B/UP prompt appears.

  SELECT the NAV B/UP prompt on both MCDU.

  SELECT NAV on both RMP

  Tune the required navaids



```

Ident.: DSC-22_20-60-150-A-00001369.0001001 / 16 MAR 11

AP AND A/THR

One FG at least must be available to allow the engagement of AP/FD and A/THR.

All FM managed modes are lost as well as managed speed. As a consequence :
- LAT F-PLN is flown in HDG/TRK modes
- VERT F-PLN is flown in OPEN/V/S/FPA modes
- SPD TARGET is manually SELECTED on the FCU
- SPD/MACH crossover is manually SELECTED on the FCU

It is recommended to use the TRK/FPA modes :
- SELECT the required TRK on FCU at waypoint sequencing (as no AP/FD coupling exists in NAV B/UP). F-PLN sequencing is automatic.
- MONITOR the track of the next leg prior reaching the TO waypoint (track between TO and next waypoints is true track).
- ADJUST the track to follow the F-PLN with X-TRK = 0
- USE OP DES or FPA to descend as suitable.
  FPA allows easy altitudes predictions :
  DNM = Δ(FL)/FPA°

Ident.: DSC-22_20-60-150-A-00001370.0002001 / 16 MAR 11

NAVIGATION MONITORING

The navigation accuracy check must be achieved periodically using the same principle as with FM navigation:

COMPARE computed data with raw data
SELECT ON RMP the applicable NAVAID
PRESS the [PROG] key

B/UP PROG page is displayed

WRITE in the scratchpad then ENTER the navaid LAT/LONG
SELECT associated navaid needle on the EFIS control panel.
COMPARE computed BRG/DIST with RAW DATA on ND

- *If the crosscheck is POSITIVE the ND may be used in ROSE NAV/MAP modes with raw data*
- *If the crosscheck is NEGATIVE the ND must be used in ROSE VOR/ROSE ILS modes.*

Note: *B/UP IRS and B/UP GPS (GPS ◁) pages may also be used to check the position.*

Ident.: DSC-22_20-60-150-A-00001371.0001001 / 16 MAR 11

FLIGHT PLANNING

The following revisions may be achieved :
- WPT insertion/deletion
- OVERFLY insertion/deletion
- DIR TO a waypoint
- CLR waypoints/discontinuities

Waypoint identifiers are either published waypoint identifiers if present in the MCDU active F-PLN, or coded LAT/LONG identifiers resulting from pilot entries.
All flight planning functions are directly applied on active F-PLN without LAT REV page.

Ident.: DSC-22_20-60-150-A-00001372.0001001 / 01 OCT 12

WAYPOINT INSERTION

Waypoint insertion into the F-PLN is performed via the B/UP F-PLN page by selecting the line key adjacent to the desired point of insertion, whenever a pre-existing waypoint identifier or valid IDENT/LAT/LONG or LAT/LONG entry is displayed in the scrathpad.
Any waypoint entry which causes the number of legs in the route to exceed the maximum allowed results in the “F-PLN FULL” message.

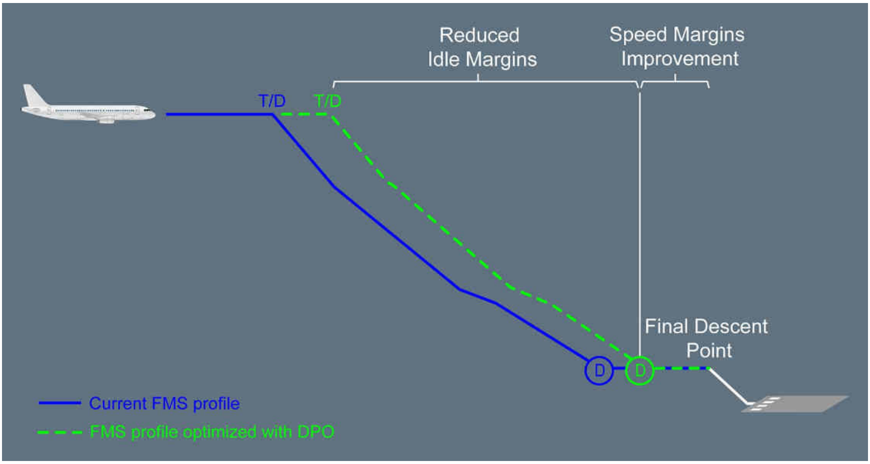
DESCENT PROFILE OPTIMIZATION ⋖

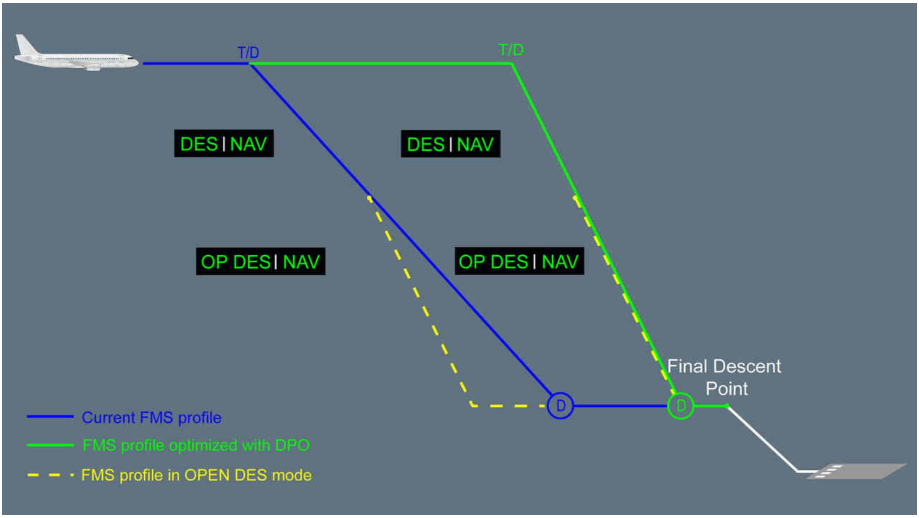
Ident.: DSC-22_20-60-160-00023457.0001001 / 04 JUN 19
Applicable to: ALL

During the idle segment in descent, margins are added to the idle thrust to have more flexibility to maintain the aircraft on the computed descent profile in case of external perturbations such as important wind change.
The Descent Profile Optimization (DPO ⋖) optimizes the computed vertical profile. It decreases the idle thrust margins in descent and the speed margins in approach to reduce fuel burn in descent phase.
With DPO ⋖ , the computed vertical profile is steeper. The T/D is reached later. Before the final approach, the deceleration level-off is shorter.



Reduced
Idle Margins
Speed Margins
Improvement
T/D
T/D
Final Descent
Point
D
D
Current FMS profile
FMS profile optimized with DPO

With DPO ⋖ , along the idle segment, without altitude constraint, the descent profile computed by the FMS is the same as the descent profile of OPEN DES mode. Therefore, reverting in OPEN DES mode during the descent does not change the descent rate.



T/D
T/D
DES | NAV
DES | NAV
OP DES | NAV
OP DES | NAV
Final Descent Point
D
D
Current FMS profile
FMS profile optimized with DPO
FMS profile in OPEN DES mode

With DPO ⧏✻ , the FMS has less flexibility to maintain the aircraft on the computed vertical profile in case of difference between wind entry and effective wind. Therefore, the accurate winds have to be entered in the FMS before descent.

During descent, the VDEV should be closely monitored. If the aircraft goes above the flight descent profile, the flight crew may have to extend speed brakes to go back on the computed descent profile.

If ENG ANTI ICE or ENG ANTI ICE and WING ANTI ICE are used during descent (inducing an increased idle thrust), the flight crew may have to extend speed brakes to stay on the computed descent profile.

FLIGHT PLAN INITIALIZATION THROUGH ACARS (OR ATSU ◁)

Ident.: DSC-22_20-70-00001382.0001001 / 19 DEC 12
Applicable to: ALL

REQUEST FOR ACTIVE FLIGHT PLAN INITIALIZATION BEFORE ENGINE START

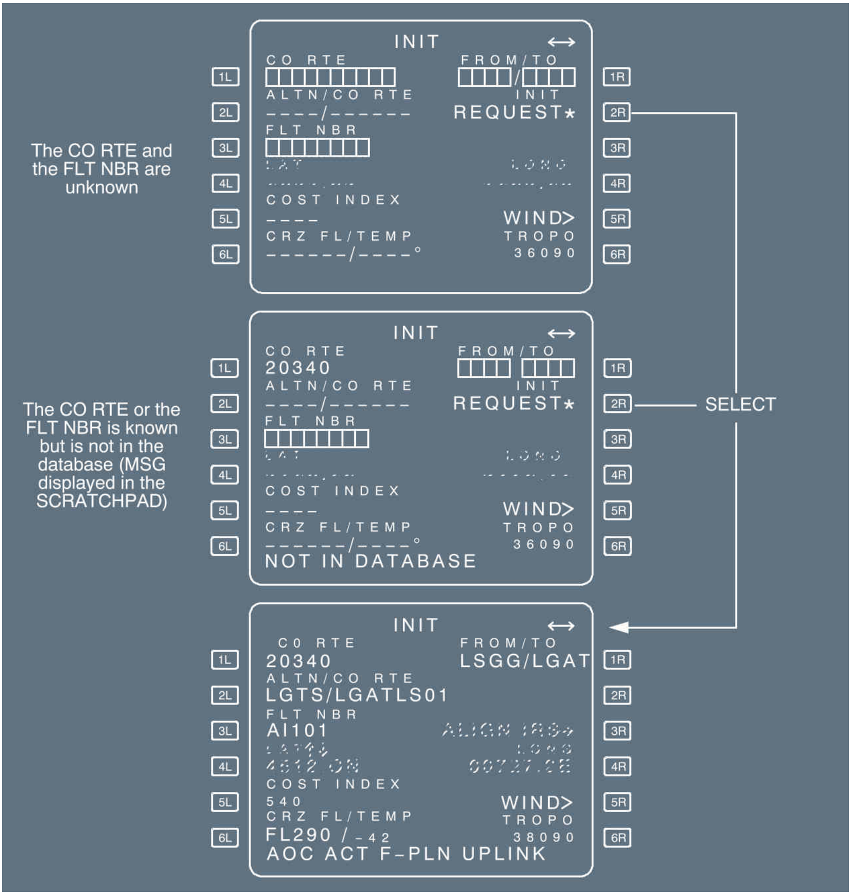
Before engine start, the flight crew may request a route for the active flight plan. When the route is received, “AOC ACT F-PLN UPLINK” message is displayed on the MCDU indicating that the flight plan has been received and automatically inserted.
After engine start, it is not possible to initialize directly the active flight plan since the received flight plan is automatically routed into the secondary, and the MCDU displays “AOC SEC F-PLN UPLINK”.

PROCEDURE

PRESS the INIT REQUEST * prompt.

The star (*) disappears, and dashes appear in all the data fields except:
- *CO RTE, FLT NBR if previously displayed and*
- *Fields with default values.*

The star is not displayed when the FMGES cannot communicate with the ACARS. No request can be sent.
When an active flight plan exists, INIT REQUEST prompt is removed from the active INIT page and no request can be sent for the active flight plan. If a flight plan is entered manually after the request, the uplink message is routed to the secondary flight plan.



The CO RTE and the FLT NBR are unknown

AOC ACT F-PLN UPLINK

REQUEST FOR SECONDARY FLIGHT PLAN

A request for a secondary flight plan can be initiated anytime. Any flight plan received after engine start is automatically routed into the secondary flight plan.
When the flight plan is received, a message “AOC SEC F-PLN UPLINK” is displayed on the MCDU scratchpad.
Before engine start, and if the SEC F-PLN is empty, any uplinked flight plan is automatically inserted into the secondary flight plan, and no flight crew action is required.
After engine start, or if the SEC F-PLN is not empty, the flight crew must manually insert the uplinked flight plan via the INSERT UPLINK prompt.

PROCEDURE TO INSERT OR REJECT A SECONDARY FLIGHT PLAN

When the uplink message is received, the INIT REQUEST prompt of INIT A page is replaced by INSERT UPLINK (2R field). Pressing the 2R will insert the flight plan into the secondary one. Clearing the prompt will reject it.

If a temporary flight plan or a DIR TO is in progress, the uplink insertion is not accepted until the temporary flight plan or the DIR TO is completed.

WIND DATA

Ident.: DSC-22_20-70-B-00001384.0001001 / 07 FEB 11
Applicable to: ALL

REQUEST FOR WIND DATA

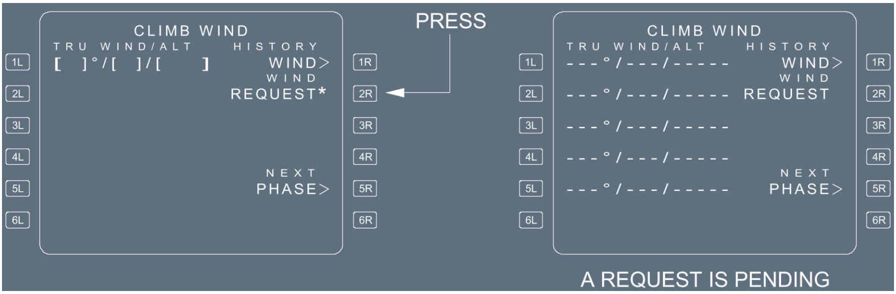
To send a wind request, press the “WIND REQUEST” selection key of any of wind pages. This request is automatically sent to the ground for one or more flight phases and for the selected flight plan (primary or secondary). The content of the wind request message is not dependent on the selected wind page (CLIMB, CRUISE or DESCENT) but on the flight phase in progress.

- For the active flight plan or the secondary flight plan that is a “COPY ACTIVE”, a wind request sent by the crew:
  - During the preflight or takeoff phase, initiates a demand for climb, cruise, descent and alternate winds.
  - During climb and cruise phase, initiates a demand for cruise, descent and alternate winds.
  - During descent/approach and go around, no wind request is possible.
- For a secondary flight plan that is not a “COPY ACTIVE” there is no restriction linked to flight phase.

For both the active and secondary flight plan:

Before engine start, and if data has not been entered in any WIND page for the flight plan, the uplinked wind data is automatically inserted into the flight plan, and no flight crew action is required.

If the uplinked wind message is received after engine start, or if data has been entered in any WIND page of the flight plan, the flight crew must manually insert the uplinked wind data via the INSERT UPLINK prompt.



When the amber star following the “WIND REQUEST” is not displayed, the FM is not able to communicate with the ACARS and the flight crew cannot send any request. When a temporary flight plan is active or a DIR TO is selected, an uplink message cannot be displayed and the “WIND UPLINK PENDING” scratchpad message remains displayed until the action is completed.

Ident.: DSC-22_20-70-B-00005784.0001001 / 03 NOV 21
Applicable to: LV-GKO, LV-GKP

PROCEDURE TO INSERT WIND DATA

When the uplink message is received, the 2R field is modified, the amber “WIND REQUEST” is replaced by the blue “INSERT UPLINK*”. This prompt, when pressed, enables the flight crew to insert the uplink wind data, phase by phase.

To access, review, insert or delete the uplink wind data of other phases, the flight crew uses the “NEXT PHASE” or “PREV PHASE” key.

If the flight crew is not satisfied with the uplink winds, the flight crew delete the winds, phase by phase clearing the “INSERT UPLINK” prompt. This will delete all the uplinked winds of the selected flight phase.

CRUISE WIND PAGE REQUEST IS PENDING

UPLINKED DATA PRIOR TO INSERTION

A wind request sent during the cruise phase will apply to downpath waypoints of the cruise, descent, approach and alternate phases.

- If the uplink message contains more data and waypoints than the flight plan, the winds at extra waypoints are not considered and are automatically discarded. This is transparent to the flight crew.
- Clearing the INSERT UPLINK* prompt deletes all uplink wind data of the CRUISE phase. The CRUISE page reverts to the previous data.

Note: *During cruise, whenever uplink wind data is received and not inserted or cancelled CRUISE WIND page, access to the DIR TO function is not possible. The "WIND UPLINK EXISTS" message is displayed on the MCDU scratchpad.*
Insert or cancel the uplinked wind message first and then access the DIR TO function.

DESCENT WIND PAGE

The procedures to insert, review or delete descent winds during preflight, climb or cruise phase are described in the above wind general procedure.
In descent, approach or Go-around phases, the flight crew cannot request or modify the descent winds of the active flight plan or secondary flight plan if it is a “COPY ACTIVE”.

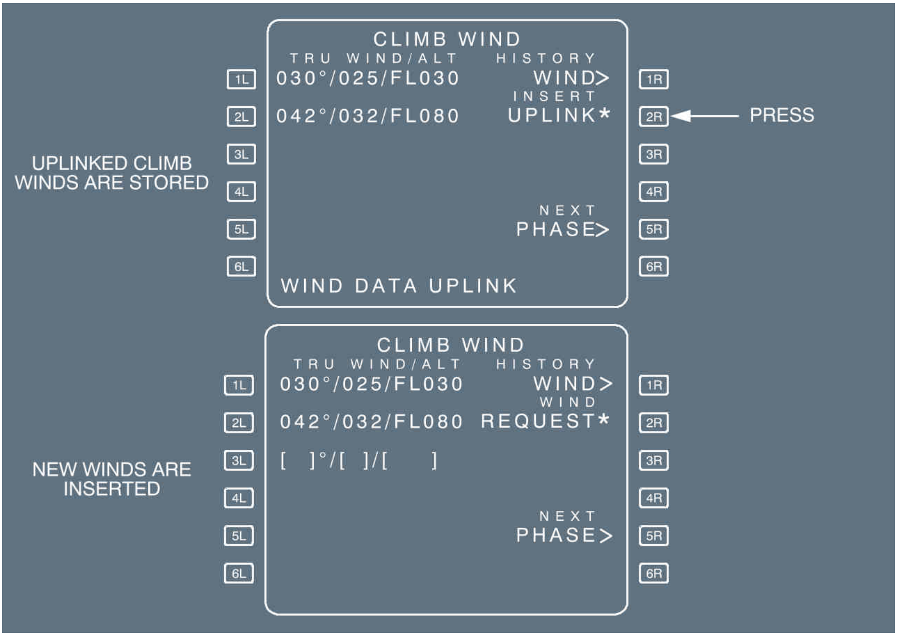
UPLINKED DATA
PRIOR TO INSERTION

If the alternate wind is not available, dashes are displayed in the field.

Ident.: DSC-22_20-70-B-00005784.0004001 / 03 NOV 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

PROCEDURE TO INSERT WIND DATA

When the uplink message is received, the 2R field is modified, the amber “WIND REQUEST” is replaced by the blue “INSERT UPLINK*”. This prompt, when pressed, enables the flight crew to insert the uplink wind data, phase by phase.
To access, review, insert or delete the uplink wind data of other phases, the flight crew uses the “NEXT PHASE” or “PREV PHASE” key.
If the flight crew is not satisfied with the uplink winds, the flight crew delete the winds, phase by phase clearing the “INSERT UPLINK” prompt. This will delete all the uplinked winds of the selected flight phase.



```

A wind request sent during the cruise phase will apply to downpath waypoints of the cruise, descent, approach and alternate phases.

- If the uplink message contains more data and waypoints than the flight plan, the winds at extra waypoints are not considered and are automatically discarded. This is transparent to the flight crew.
- Clearing the INSERT UPLINK* prompt deletes all uplink wind data of the CRUISE phase. The CRZ WIND page reverts to the previous data.

DESCENT WIND PAGE

The procedures to insert, review or delete descent winds during preflight, climb or cruise phase are described in the above wind general procedure.
In descent, approach or Go-around phases, the flight crew cannot request or modify the descent winds of the active flight plan or secondary flight plan if it is a “COPY ACTIVE”.

GENERAL

Ident.: DSC-22_20-80-00001385.0001001 / 01 APR 11
Applicable to: ALL

The PRINT function allows various reports to be printed either automatically (when linked to ACARS or ATSU ◁) or manually.

The manual PRINT function allows printing of FM-generated flight reports and additional data :

F-PLN	INITialization data
T.O.	Data
WIND	Data
PREFLIGHT	REPORT
IN FLIGHT	REPORT
POSTFLIGHT	REPORT

Refer to DSC / 22_20 Auto Flight - Flight Management / 50 Controls and Indicators / 10 MCDU - Page Description for a detailed description of the PRINT FUNCTION pages.
The print function is available whether ACARS or ATSU ◁ are available or not.
The various flight reports collect most of the prediction information required by the crew to monitor the progress of the flight. The resulting documents may thus be used as realistic master documents, based on the latest data provided by the crew to the computer in terms of ATC clearances and weather information.

PRINT FUNCTION ACCESS

Ident.: DSC-22_20-80-00001386.0001001 / 24 JAN 11
Applicable to: ALL

The PRINT FUNCTION page is accessed :
- From the DATA INDEX A PAGE, or
- From the ACARS FUNCTION page (if ACARS is installed).

ON GROUND BEFORE ENGINE START

Ident.: DSC-22_20-80-00001387.0001001 / 24 JAN 11
Applicable to: ALL

When the overall F-PLN data (lateral, vertical including winds, steps, constraints) and the ZFW and ZFWCG values have been inserted :

SELECT the FUEL PLANNING prompt [3R]

- **If the computed BLOCK fuel does not correspond to the actual block fuel required for the flight :**
  ENTER the actual block fuel required for the flight in the [2R] field
  PRINT the PREFLIGHT REPORT

  The flight crew may then use the PREFLIGHT report to monitor the progress of the flight.

  Note: *Before printing the PREFLIGHT report, the flight crew must check that the F-PLN is complete (all F-PLN discontinuities must be cleared) and that all the F-PLN elements (including winds, steps, constraints, alternate airport) have been inserted, in order to obtain an accurate PREFLIGHT report.*

IN FLIGHT

Ident.: DSC-22_20-80-00001389.0002001 / 24 JAN 11
Applicable to: ALL

When the aircraft has reached the CRZ FL, and when all the latest ATC clearances have been inserted in the FM, and when all the WINDS/STEPS have been properly updated:

ACCESS to the PRINT FUNCTION page
PRINT the INFLIGHT REPORT

The inflight report provides the list of all the overflown F-PLN waypoints (HISTORY VALUES) with their associated data (Time, Alt, Fuel, ...), and the predictions to all the downpath waypoints (PREDICTED VALUES).
This new document replaces the PREFLIGHT report, since it carries all the latest expected F-PLN changes. It is the new applicable master document used to monitor the progress of the flight.
The inflight report will be printed after each important F-PLN modification.

Note: *If the selected Fuel Unit option is pounds, the HISTORY FOB values may be incorrectly printed in tons on the INFLIGHT REPORT. The CURRENT and PREDICTED FOB values, however, are correctly printed in pounds.*

HOW TO CHANGE T.O DATA OR DEPARTURE RUNWAY AFTER REJECTED TAKEOFF

Ident.: DSC-22_20-85-00023458.0001001 / 28 MAY 20
Applicable to: ALL

GENERAL

This chapter provides an operational recommendation to the flight crew, on how to modify the FMS T.O DATA or departure runway after a rejected takeoff.

DESCRIPTION

In case of rejected takeoff (with an aircraft speed above 90 kt or with sufficient thrust), the FMS remains in TAKEOFF phase and the flight crew cannot modify the FMS T.O DATA or departure runway in the active flight plan.

OPERATIONAL RECOMMENDATION

In that case, if the flight crew has to change the FMS T.O DATA or departure runway in the active flight plan, the flight crew should proceed as follows:
- Delete the SEC F-PLN
- Initialize the SEC F-PLN with the new T.O DATA and/or new departure runway
- Activate the SEC F-PLN.

INSERTION OF APPROACH MINIMA

Ident.: DSC-22_20-85-D-00015014.0001001 / 21 MAR 17
Applicable to: LV-GKO, LV-GKP

QNH USE FOR AIRCRAFT NOT EQUIPPED WITH QFE OPTION

This table explains how the flight crew must insert the approach minimum on the MCDU PERF APPR page.

		Guidance Modes			
		LOC G/S CAT II & CAT III approaches	LOC G/S CAT I approaches	FINAL APP	NAV FPA LOC FPA LOC B/C FPA TRK FPA
MCDU PERF APPR page	MDA field	---	DA	DA or MDA	MDA
	DH field	DH or RA	---

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

QNH USE FOR AIRCRAFT NOT EQUIPPED WITH QFE OPTION

This table explains how the flight crew must insert the approach minimum on the MCDU PERF APPR page.

		Guidance Modes			
		LOC G/S CAT II & CAT III approaches	LOC G/S CAT I approaches	FINAL APP	NAV FPA LOC FPA LOC B/C FPA TRK FPA
MCDU PERF APPR page	BARO field	---	DA	DA or MDA	MDA
	RADIO field	DH or RA	---		
FMA display		“RADIO XXX”	“BARO XXXX”		

Ident.: DSC-22_20-85-D-00015016.0001001 / 21 MAR 17
Applicable to: ALL

QFE USE FOR AIRCRAFT NOT EQUIPPED WITH QFE OPTION

The crew should not use QFE on aircraft with a “QNH only” pin programming (incorrect profile computation of the managed vertical modes CLB, DES and FINAL APPR, possible false GPWS warnings in mountainous areas).

AUTOMATIC FMGEC RESET AND RESYNCHRONIZATION

Ident.: DSC-22_20-90-10-A-00011993.0007001 / 28 MAY 20
Applicable to: ALL

FM RESET

When the FM software cannot work properly or receives instructions to perform impossible operations, it automatically resets itself. A resynchronization with the other FM always follows. When the reset is a minor one, the system will recover by itself.

When the reset is a major one:
- Resets recur at short intervals (several in 2 min to 3 min).
- The memories are cleared, leading to the loss of F-PLN, GW, CI, CRZ FL, MCDU-entered speeds and NAVAIDs and to database switching.

CAUTION	If three dual FM resets occur in 2 min, pilot-entered data is lost. If a dual reset is identified, it is recommended that the flight crew does not perform again the last MCDU actions for 1 min (in order to avoid a potential second dual reset, leading to the loss of pilot-entered data).

Ident.: DSC-22_20-90-10-A-00011994.0007001 / 07 FEB 11
Applicable to: ALL

FM RESYNCHRONIZATION

An FM resynchronization automatically occurs after an FM reset but it may occur independently each time self comparisons between FM1 and FM2 reveal discrepancies.
One single resynchronization lasts approximately 25 s.
If several resynchronizations occur within 5 min, independent mode commences.

Ident.: DSC-22_20-90-10-A-00011995.0007001 / 02 JUN 20
Applicable to: ALL

FMGC STATUS DURING A RESET/RESYNCH

While a RESET/RESYNCH occurs:
- The ND shows MAP NOT AVAIL.
- The MCDU reverts to the A/C STATUS page, with PLEASE WAIT displayed in the scratchpad with the FM FAULT light illuminated.
- Autotuning of NAVAIDs (VOR, DME, ADF ◁) are lost on the failed side.
- AP and managed modes may be transiently lost (reversion to HDG / V/S or TRK/FPA).
- If the flight crew presses a key while the scratchpad is showing PLEASE WAIT, there is no change at MCDU level. This behavior is normal. The flight crew should not respond by pulling the MCDU C/B.

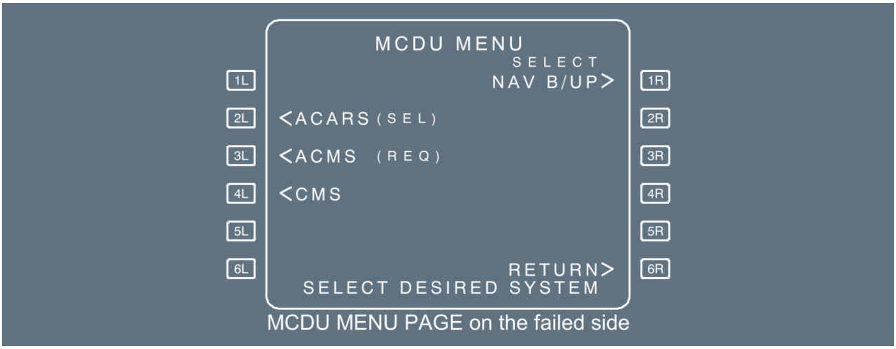
Ident.: DSC-22_20-90-10-A-00011997.0016001 / 14 JAN 16
Applicable to: ALL

SINGLE LATCH

If 4 successive resets occur, the failing FMGEC will latch and single mode operation commences.

While this is occuring:
- The failed ND side displays “MAP NOT AVAIL” and “SELECT OFFSIDE RNG/MODE” (if the NDs are not both in the same mode or range).
- The MCDU of the failed side displays the MCDU menu, and the FM FAULT light illuminates.
- If AP and FD was previously engaged on the failed side, the AP, FD disengage and the righthand column of the FMA shows that the operating FD is offside.
  ECAM displays the warning “AP OFF” and “FM1(2) FAULT”, and the master warning and audio remind the pilot of the AP disengagement.
- All functions are restored on the operative side



```
MCDU MENU
                    SELECT
                 NAV B/UP>
<ACARS (SEL)
<ACMS  (REQ)
<CMS

                   RETURN>
SELECT DESIRED SYSTEM
```

MCDU MENU PAGE on the failed side

PROCEDURE

- ENGAGE the non affected AP
- ENGAGE managed modes.
- RESET the affected FM with the FMGEC reset breaker on the overhead panel.

● **If successful:**

A resynchronization is launched.

● **If unsuccessful:**

FMGEC operates in single mode:
- PULL the FMGEC reset breaker of the affected FMGEC.
- SELECT FM source BOTH ON 1 or 2.
  Both NDs operate in the range and mode selected on the EFIS control panel corresponding to the FM source.

Ident.: DSC-22_20-90-10-A-00011996.0011001 / 07 FEB 11
Applicable to: ALL

SINGLE RESET OR DUAL RESET WITH AUTORECOVERY

If the RESET/RESYNCH succeeds, all functions are recovered.

PROCEDURE

- RESELECT the convenient MCDU page
- REENGAGE managed modes and AP.
  WAIT 1 min after the “PLEASE-WAIT” message has disappeared before engaging the AP/FD of the failed FMGC.

Ident.: DSC-22_20-90-10-A-00011998.0013001 / 13 DEC 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

DUAL RESET WITH LOSS OF DATA AND AUTORECOVERY

Three successive dual resets without result, erase all flight crew-entered data (F-PLN, GW, CRZ FL, CI, etc.).

When FMGES recovery is obtained:
- Database cycle may have switched
- The FM position bias is lost. The FM position returns to the MIX IRS position
- Autotuning of VOR/DME are restored, based on the aircraft’s IRS position
- FMGES tuning of the ILS and ADF ◁ is not possible
- Lateral and vertical managed modes cannot reengage
- The CAB PR LDG ELEV FAULT alert is displayed
- The REENTER WEIGHT/CG MCDU message is displayed.

PROCEDURE

When the system has recovered, managed speed may not reengage, because its target would be Green Dot. The PERF/IDLE factor is reset to 00/00. If a PERF/IDLE factor was entered, performance may be slightly modified after recovery.
If the FMGEC remains in Takeoff phase, CHANGE the vertical mode in order to recover the next flight phase.

SELECT the initial database.
SELECT DIR TO the required downpath waypoint.
SELECT LAT REV at the downpath waypoint and redefine DESTINATION.
SELECT the FUEL PRED page and reenter GW and CG values read on the FUEL SD page.
SELECT the PROG page and enter CRZ FL.
SELECT the PERF page and enter CI.
CHECK or REENGAGE (as appropriate) the relevant speed/Mach target and vertical mode.

L2 *Redefine the flight plan for the remainder of the flight.*

L1 PERFORM a NAV accuracy check, when possible.

L2 *The flight crew should consider a manual FM position update, if MIX IRS and actual positions differ by more than 20 NM.*

Ident.: DSC-22_20-90-10-A-00011998.0026001 / 13 DEC 22
Applicable to: LV-KHT, LV-KHU

DUAL RESET WITH LOSS OF DATA AND AUTORECOVERY

Four successive dual resets in 3 min, erase all flight crew- entered data (F-PLN, GW, CRZ FL, CI, etc.).

When FMGES recovery is obtained:
- The FM position bias is lost. The FM position returns to the MIX IRS position
- Autotuning of VOR/DME are restored, based on IRS position of the aircraft
- FMGES autotuning of the ILS/GLS ◁ and ADF ◁ is not possible
- SLS ◁ is not available
- Lateral and vertical managed modes cannot re-engage
- The CAB PR LDG ELEV FAULT alert is displayed
- A map display may be lost on one ND
- The REENTER ZFW/ZFWCG MCDU message is displayed.

PROCEDURE

When the system has recovered:
If the FMGC remains in Takeoff phase, CHANGE the vertical mode in order to recover the next flight phase.

SELECT DIR TO the required downpath waypoint.

SELECT LAT REV at the downpath waypoint and redefine DESTINATION.
SELECT the FUEL PRED page and enter the ZFW and ZFWCG values.
SELECT the PROG page and enter CRZ FL.
SELECT the PERF page and enter CI.
CHECK or REENGAGE (as appropriate) the relevant speed/Mach target and vertical mode.

L2 *Redefine the flight plan for the remainder of the flight.*

L1 PERFORM a NAV accuracy check, when possible.

L2 *The flight crew should consider a manual FM position update, if MIX IRS and actual positions differ by more than 20 NM.*

Ident.: DSC-22_20-90-10-A-00012016.0006001 / 31 MAR 11
Applicable to: ALL

DUAL LATCH

- Both FMGCs are inoperative. FM and FG capability are lost.
- Both NDs display “MAP NOT AVAILABLE”. NAVAID tuning is not performed.
- AP/FD and A/THR are lost.
- Both MCDUs revert to the MCDU MENU page.
- The following messages are displayed on the ECAM:
  “CAB PR LDG ELEV FAULT”
  “AUTO FLT AP OFF”, if the AP was engaged
  “AUTO FLT A/THR OFF”, if the A/THR was engaged.
- “AUTO FLT FM1 + 2 FAULT”.

PROCEDURE

- FLY raw data.
- TUNE necessary NAVAIDs, using the RMPs.
- Successively RESET both FMGCs, with the FMGEC reset breakers C/B that are located on the overhead panel.

● **If successful, refer to dual reset with loss of data and auto recovery:**

Note: *A recovery will result in the loss of all pilot-entered data.*

● **If unsuccessful:**

- FLY raw data.
- SET the FM source to NORM.
- SELECT the NAV B/UP prompt on both MCDU DATA pages.
  (*Refer to the FCOM Aircraft Systems description (Auto-Flight), concerning navigation backup operation)*.
- SET the landing elevation of the destination on the overhead panel.

Ident.: DSC-22_20-90-10-A-00012017.0001001 / 17 MAR 17
Applicable to: ALL

FMGEC RESET DURING ILS/GLS ◁ APPROACH

- **Above 700 ft AGL:**

  ILS/GLS ◁ tuning may be lost. The loss of ILS/GLS ◁ tuning, due to a dual reset, will cause a loss of the LOC and G/S, and the disengagement of the APs and FDs. In this case:
  - PERFORM a go-around, if not stabilized at 1 000 ft AGL, and if visual references are not acquired.

- **Below 700 ft AGL:**

  A single or double reset does not affect an ILS/GLS ◁ approach below 700 ft AGL. ILS frequency/GLS ◁ channel is locked and AP/FDs remain engaged.
  - CONTINUE the approach.

Ident.: DSC-22_20-90-10-A-00012021.0001001 / 07 FEB 11
Applicable to: ALL

FMGES RESET DURING NON PRECISION APPROACH

During a non ILS approach, if the master FMGC fails, AP/FD and managed modes are lost and FDs engage in basic modes.

- PERFORM a go-around, if not stabilized at 1 000 ft, and if visual references are not acquired.

MANUAL FMGEC RESET

Ident.: DSC-22_20-90-10-00012049.0001001 / 05 MAY 22
Applicable to: ALL

MANUAL RESET OF FMGEC

On rare occasions, the FMGEC may require manual resetting.
If this occurs in flight, reset one FMGEC at a time.

The aircraft has two reset buttons per FMGEC, located on the overhead panel:
- The FM reset button

CAUTION	Do not use the FM reset button.

  Note: *Using the FM button may lead to a failed start of the FMGEC.*

- The FMGEC reset button

  Note: *The FMGEC reset button resets the flight management, flight guidance, and flight envelope parts of the FMGEC.*

Resetting via the FMGEC reset button disconnects the onside autopilot.
Following the reset, the FM resynchronizes with the opposite FM.
Resetting the FMGEC manually via the reset button does not increment the reset counter: there is no limitation to the number of resets commanded manually via the reset buttons.

Note: *Due to electrical transient, MANUAL FMGEC RESET procedure may be unsuccessful. If so and on ground, the flight crew may attempt the same procedure with engines not running.*

Intentionally left blank

ERRONEOUS PREDICTIONS

Ident.: DSC-22_20-90-20-00012041.0001001 / 28 MAY 20
Applicable to: ALL

DESCRIPTION

The FMGES may temporarily display erroneous predictions that can affect such data as ECON speed/Mach, optimum flight level, fuel or time predictions.

OPERATIONAL RECOMMENDATION

The flight crew should not perform a reset of the FMS.

FOR MISSING PREDICTIONS OR OBVIOUS ERRONEOUS PREDICTIONS

To recover the FMS predictions:

1. On the WIND page, the flight crew should verify for each flight level:
   - The temperature value for each cruise waypoint
   - The wind data for each cruise waypoint.

   If some temperature or wind data are erroneous or missing the flight crew should:
   - Update data
   - Check if correct predictions are recovered.
2. In the legs of the Flight Plan, the flight crew should verify:
   - If there is one Flight Plan leg with erroneous predicted distance, or erroneous predicted time or erroneous predicted fuel consumption, and
   - If one Flight Plan leg with erroneous predictions exists, then the flight crew should:
     - Insert an intermediate waypoint
     - Check if correct predictions are recovered.

3. In the arrival procedure of the Flight Plan, the flight crew should verify:
   - If there are two successive waypoints separated by a distance of 3 NM or less, and
   - If one of these two waypoints contains an AT OR BELOW altitude constraint the flight crew should:
     - Insert the same altitude constraint to the lowest waypoint
     - Check if correct predictions are recovered.

FOR SUSPECTED ERRONEOUS PREDICTIONS OR TO FORCE A F-PLN RE-COMPUTATION

If the flight crew suspects that the FMS predictions are erroneous (slow computations, slightly erroneous values, etc.) and if the previous actions remain not successful, in order to recover the FMS predictions, the flight crew should:

- Copy of the ACTIVE F-PLN into a SEC F-PLN
- Remove the STAR procedure of the ACTIVE F-PLN

  Note: *The STAR usually contains a lot of constraints which may disturb FMS predictions computations.*

- Insert again the STAR in the ACTIVE F-PLN, later during the flight.

SPURIOUS ENGINE-OUT INDICATION

Ident.: DSC-22_20-90-20-00012042.0001001 / 17 MAR 17
Applicable to: ALL

PROCEDURE

If a spurious engine-out is detected:

PROCEDURE

- PRESS the EO CLR prompt of the MCDU PERF page
- RE-ENGAGE previous vertical mode
- RE-ENTER preselected speeds (if any).
  No other consequences are to be expected.

INCORRECT MDH AFTER SEC F-PLN ACTIVATION (QFE PIN-PROGRAMMED AIRCRAFT ONLY)

Ident.: DSC-22_20-100-20-00013462.0001001 / 18 MAY 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

If there is a value in the MDH field [2R] of SEC PERF APPR page (manually entered by the flight crew or resulting from a COPY ACTIVE of the active F-PLN), and if the flight crew then activates the SEC F-PLN, the FMS may spuriously modify the MDH value. The MDH value in the active flight plan's PERF APPR page may be spuriously modified by the altitude difference between the airport elevation and the landing runway elevation.

Example:
- MDH in SEC PERF APPR page: 500 ft
- Airport elevation: 520 ft; Runway elevation: 560 ft
- Airport elevation - Runway elevation equals -40 ft
- After SEC F-PLN activation, MDH in PERF APPR page is 460 ft.

Depending on the airport, this would cause early or late triggering of:
- The "Hundred above" or "Minimum" auto-callouts
- The automatic AP disconnection at MDH - 50 ft.

Note: *The altitude difference between the airport elevation and the landing runway elevation may be positive or negative depending on the airport/runway involved.*

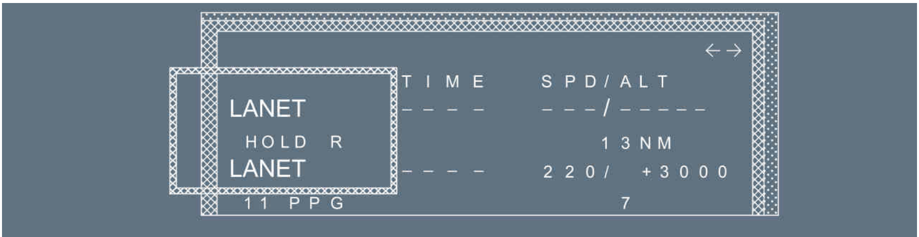
PROCEDURE

- **If there is a value in the MDH field of SEC PERF APPR page, then after activating the SEC F-PLN:**
  MDH value on PERF APPR page...CHECK/MODIFY AS RQRD

INCORRECT MANAGEMENT OF SPEED CONSTRAINT FOR ARRIVAL PROCEDURE HOLDS

Ident.: DSC-22_20-100-20-00013768.0001001 / 16 NOV 11
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

A procedure Holding Pattern (HOLD) is part of a navigation database procedure. The flight crew cannot manually insert it in the flight plan.
The aircraft flies the HOLD one time, and exits it automatically at the HOLD fix.



```
                                        ←→
          TIME        SPD/ALT
LANET     ----        ---/-----
  HOLD R                  13NM
LANET     ----        220/  +3000
  11 PPG                   7
```

Procedure HOLD on the F-PLN MCDU page

The FMS computes procedure HOLDs based on the predicted speed of the aircraft at the pattern entry. For an arrival procedure HOLD, the FMS-predicted speed takes into account:

- The ICAO-fixed speed limit for the hold,
- Any speed constraint coded at the hold entry fix.

Some operators reported the following misbehaviour: if charts indicate a speed constraint for a procedure HOLD, the FMS erroneously applies this speed constraint only at the exit fix, instead of the entry fix. As a consequence, the FMS-predicted HOLD speed does not take the speed constraint into account.
As a result, the FMS may compute the HOLD based on a speed that is higher than required. In such a case, the HOLD will have a size larger than expected.

<u>Note:</u> *If the flight crew reverts to selected speed to reduce the speed at the HOLD entry, the FMS will not re-compute the size of the HOLD.*

OPERATIONAL RECOMMENDATION

During descent preparation:

- Use the charts to CHECK if the arrival procedure includes a HOLD that has a speed constraint.
- If the arrival procedure includes a HOLD that has a speed constraint: ENTER MANUALLY the speed constraint at the hold entry fix.

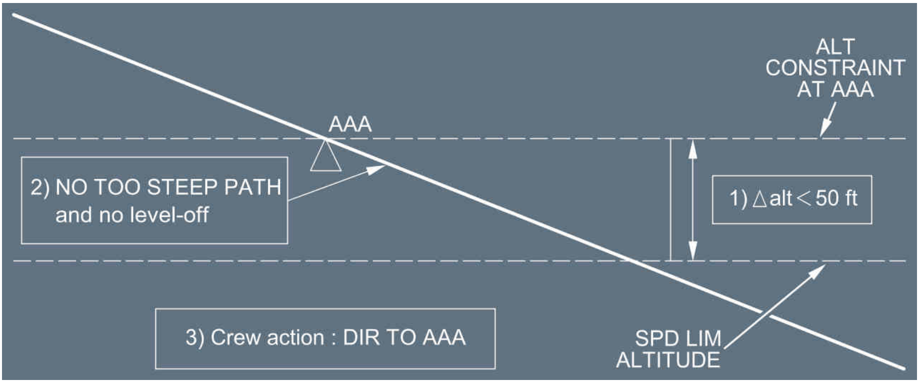
SEVERE RESET WHEN THE DESCENT SPEED LIMIT ALTITUDE IS CLOSE TO AN ALTITUDE CONSTRAINT

Ident.: DSC-22_20-100-20-00013769.0001001 / 09 OCT 12
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

Severe resets with loss of flight plan occur in the following conditions:

1. A waypoint with a descent altitude constraint is located at less than 50 ft from the descent speed limit altitude,
2. This altitude-constrained waypoint is not followed by a too steep path or a level-off,
3. The flight crew performs a DIR TO this altitude-constrained waypoint.

Note: *The altitude constraint on the waypoint may come from the Navigation database coding or from a flight crew's entry.*



As of today, these resets happen systematically in case of DIR TO on several STARs located in Ukraine. The reason is that in this area, procedures often contain by design an altitude constraint that is very close to the speed limit altitude.
Moreover, these resets may also happen anywhere, in cases where the flight crew has manually entered an altitude constraint that is very close to the speed limit altitude.

OPERATIONAL RECOMMENDATION

Do not perform a DIR TO a waypoint that has an altitude constraint located at less than 50 ft from the descent speed limit altitude.

Note: *The pseudo-waypoint "(LIM)" represents the descent speed limit on the F-PLN page.*

EOSID F-PLN LIMITED TO 10 LEGS

Ident.: DSC-22_20-100-20-00013770.0001001 / 17 MAR 11
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

When the EOSID contains more than 10 legs :
- The ND Display in PLAN mode only shows the first 10 legs of the EOSID
- In the case an engine out occurs before the diversion point, the TMPY flight plan ends at the end of the 10th leg.

To avoid that the EOSID ends after the 10th leg, the flight crew must insert the EOSID as a SID in the secondary flight plan (SEC F-PLN).

PROCEDURE

During Cockpit Preparation :

CREATE a SEC F-PLN (e.g. using COPY ACTIVE)
SELECT the EOSID as a SID in the SEC F-PLN.
REVIEW the display on the ND of the SID for Engine Out (white line) as SEC F-PLN

In the case of engine failure before the Engine Out Diversion Point :

ACTIVATE the SEC F-PLN (EOSID)

If the Navigation Database has not been changed, the automatic proposal of Temporary F-PLN for EOSID must be erased before activating the SEC F-PLN.

Note: To avoid that the flight crew needs to reject the automatic proposed TMPY F-PLN (EOSID limited to 10 legs) in case of engine failure, Airbus recommends that the EOSID is coded in the Navigation Database as a SID and not as an EOSID.

ERRONEOUS FUEL PREDICTIONS IN THE CASE OF DESCENT WITH TWO ALTITUDE CONSTRAINTS

Ident.: DSC-22_20-100-20-00013771.0001001 / 17 MAR 11
Applicable to: ALL

DESCRIPTION

If the flight plan has two altitude constraints for the descent, the flight crew may notice erroneous FMS fuel predictions.

EXPLANATION

If the flight plan has two altitude constraints for the descent, the FMS may define a geometric segment between both altitude constraints. If there is a deceleration required within the geometric segment, the FMS may consider that the geometric segment is too steep to fly without speedbrakes. In this case, the FMS tags the entire geometric segment as a speedbrake segment : The FMS assumes that during the entire segment half of the speedbrakes are extended, even for the parts where no deceleration is planned. As a consequence, the FMS will predict an increased thrust for the entire geometric segment. This may lead to erroneous fuel predictions. (a long geometric segment (e.g. above 100 NM) may lead to an error of 1.5 t for the fuel prediction at destination).

Note: When flying the geometric segment, the predictions become better as the aircraft approaches the end of the geometric segment, and turn back to normal when the aircraft has sequenced the second altitude constraint.

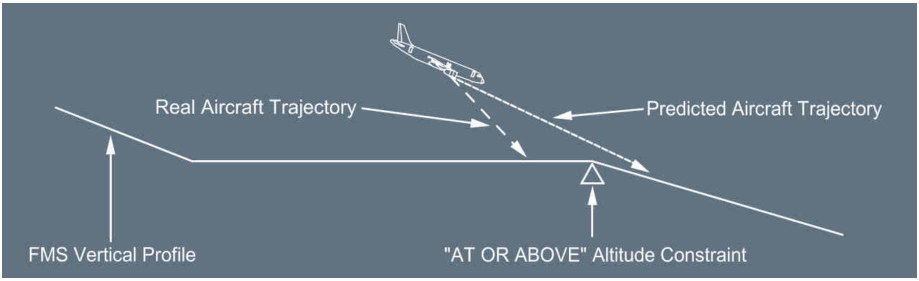
PROCEDURE

If the flight crew suspects this behavior in preflight, or during the flight, they can delete and enter again one altitude constraint in descent and compare the fuel predictions of the flight plan with and without the geometric segment. This allows the flight crew to evaluate the impact of the geometric segment on the fuel predictions.
It is not recommended to permanently delete altitude constraints that are stored in the navigation database.

UNDUE REVERSION TO V/S DURING CLIMB AND DESCENT

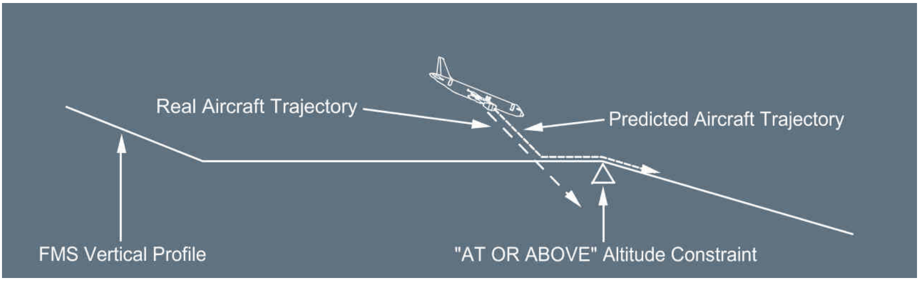
Ident.: DSC-22_20-100-20-00014332.0002001 / 04 MAY 12
Applicable to: LV-GKO, LV-GKP

A reversion to the V/S mode may occur when the aircraft reaches an altitude constraint in the CLB or DES mode, while above the vertical profile.
When the FMS is not on the vertical profile, the FMS makes assumptions in order to compute the FMS predictions. For example, if the aircraft flies in selected speed, the FMS considers an immediate return to managed speed.
These assumptions can result in FMS predictions that are not consistent with the real trajectory of the aircraft. Therefore, the FMS may not anticipate the need to level off, when the FCU selected altitude is above the altitude constraint in climb or below the altitude constraint in descent.



Real Aircraft Trajectory
Predicted Aircraft Trajectory
FMS Vertical Profile
"AT OR ABOVE" Altitude Constraint

However, the FMS requests the ALT CST* mode, when the aircraft reaches the altitude constraint, in order to level off and comply with the altitude constraint.
Due to a problem of communication between the FMS and the FG, the FMGC may unduly revert to the V/S mode. The FWC triggers a triple-click aural warning 🔊 , and the aircraft goes beyond the altitude constraint.



Real Aircraft Trajectory
Predicted Aircraft Trajectory
FMS Vertical Profile
"AT OR ABOVE" Altitude Constraint

OPERATIONAL RECOMMENDATIONS

Understand your FMA at all times.

- **If the FMGC reverts to the V/S mode:**

  Adjust the vertical speed or level off in order to comply with the altitude constraint.

OPTIMUM TARGET SPEEDS NOT UPDATED FOLLOWING THE AUTOMATIC DELETION OF A STEP CLIMB

Ident.: DSC-22_20-100-20-00014652.0001001 / 04 NOV 20
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

DESCRIPTION

During the FMS climb phase, if the flight crew selects an altitude on the FCU that is above the CRZ FL displayed on the PROG page, the altitude selected on the FCU becomes the new CRZ FL.
If this new CRZ FL is at or above the altitude of a Step Climb of the flight plan, the FMS automatically deletes the Step Climb. The FMS displays the STEP DELETED message.
As the optimum target speeds (ECON CLIMB speed/Mach and ECON CRUISE speed/Mach) depend on the CRZ FL, the FMS should immediately update the ECON CLIMB speed/Mach and the ECON CRUISE speed/Mach.
Due to a FMS misbehavior, the FMS may not correctly manage the automatic deletion of the Step Climb when the CRZ FL is automatically set to the altitude selected on the FCU. The FMS may not update the ECON CLIMB speed/Mach and the ECON CRUISE speed/Mach accordingly.
If the ECON CRUISE speed/Mach was not correctly updated, the FMS updates the ECON CRUISE speed/Mach when the aircraft reaches the new CRZ FL. However, the FMS updates the ECON CRUISE speed/Mach with a rate of 0.01 Mach/min, in order to avoid sudden increase of the target speed. Therefore, the aircraft may take several minutes to reach the new ECON CRUISE speed/Mach.

OPERATIONAL RECOMMENDATIONS

- **If the flight crew suspects this misbehavior during the flight and the FMS is in CLIMB phase:**

  CHANGE the CI or the CRZ FL on the PROG page, the optimum target speed is updated when the aircraft reaches the CRZ FL.

- **If the flight crew suspects this misbehavior during the flight and the FMS is in CRUISE phase:**

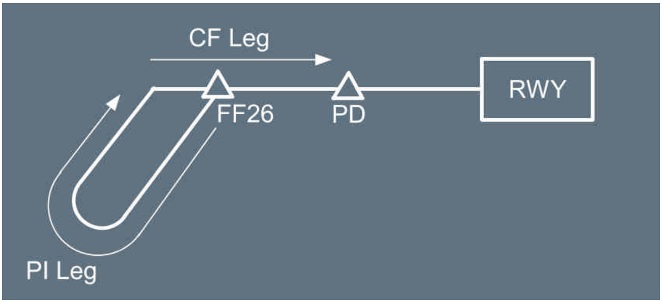
  The optimum target speed is updated with a rate of 0.01 Mach/min when the aircraft reaches the FCU altitude.

INCORRECT PROCEDURE TURN TRAJECTORY DURING NPA IN MANAGED MODE

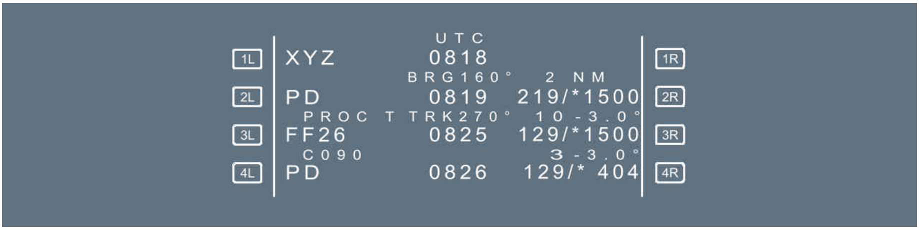
Ident.: DSC-22_20-100-20-00014846.0001001 / 29 MAY 13
Applicable to: LV-GKO, LV-GKP

The FMS does not correctly guide the aircraft in lateral managed mode on Non-Precision Approach procedures that contain a procedure turn (PI-CF leg).

A procedure turn (PI-CF leg) is coded in the Navigation Database with two leg types:
- A PI leg defines a course reversal starting at a specific database fix. It includes an outbound leg followed by a left or right turn and 180 degree course reversal to intercept the next leg
- A Course-to-Fix (CF) leg that defines a course to a waypoint.



On the MCDU F-PLN page, a procedure turn (PI-CF leg) is identified with "PROC T" as follows:



```
                UTC
XYZ             0818
              BRG160°    2 NM
PD              0819   219/*1500
   PROC T TRK270°       10 -3.0°
FF26            0825   129/*1500
   C090                  3 -3.0°
PD              0826    129/* 404
```

OPERATIONAL RECOMMENDATION

During Non-Precision Approach procedures that include a procedure turn (PI-CF leg coded in the Navigation Database), the flight crew must not use the NAV mode and the FINAL APP mode. The flight crew should fly the approach procedure in selected modes using NAVAID raw data.

ERRONEOUS LATERAL GUIDANCE IN NAV MODE WITH LOC MODE ARMED DURING APPROACH

Ident.: DSC-22_20-100-20-00014857.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

During approach, the FMS may guide the aircraft along a specific track instead of along the F-PLN with NAV mode green on the FMA, because of the LOC Convergence function (*Refer to DSC-22_30-40-80-10 LOC* Engagement Conditions - LOC Convergence Function*).
The logics of the LOC Convergence function is as follows:

- **If NAV mode is engaged, and LOC mode is armed,**
  and
  The aircraft is within 20 NM of the destination runway,
  and
  The difference between the aircraft track and the QFU is less than 20 °.

  The aircraft is guided with a track of 20 ° from the LOC axis.

  The NAV mode remains engaged. However the aircraft no longer follows the F-PLN, but converges towards the LOC axis.

- **If the difference between the aircraft track and the QFU becomes more than 20 ° when the LOC Convergence function is active:**

  The FMS deactivates the LOC Convergence function, and the aircraft follows back the F-PLN.

  It may lead to slight oscillations, since the FMS may successively activate and deactivate the LOC Convergence function.

OPERATIONAL RECOMMENDATIONS

- **If the flight crew considers that the LOC Convergence function may affect the guidance along the F-PLN trajectory in NAV mode:**

  On the intercept trajectory for the LOC axis, the flight crew should push the APPR pb (or the LOC pb-sw) when appropriate.

- **If the flight crew detects that the aircraft does not follow the intended trajectory:**

  The flight crew should revert to HDG/TRK mode, and intercept the LOC axis with the HDG/TRK mode engaged and the LOC mode armed.

ERRONEOUS TRAJECTORY DURING PROCEDURES WITH A TURN DIRECTION ON A LEG WITH AN ALTITUDE TERMINATION

Ident.: DSC-22_20-100-20-00015787.0001001 / 09 SEP 14
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

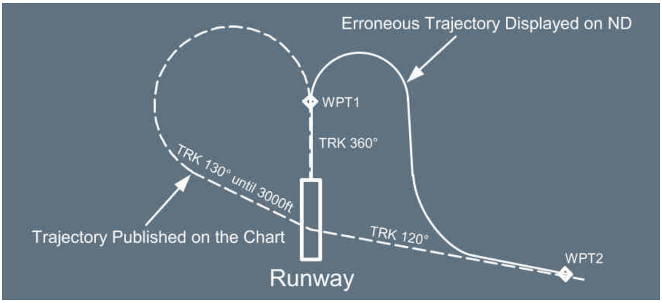
In some very specific operational conditions that depend on the coding in the Navigation Database of the procedure, and on various performance conditions (aircraft weight, flaps, thrust setting, temperature, wind...), the FMS may compute an erroneous trajectory on some Standard Instrument Departures (SID), and on some Missed Approach procedures.

The SIDs and the Missed Approach procedures that may be affected are coded in the Navigation Database with a leg that has a turn direction and an altitude termination. The leg can be one of the following:
- A Course-to-an-Altitude (CA) leg that defines a course to follow to an altitude
- A Fix-to-an-Altitude (FA) leg that defines a track to follow from a waypoint to an altitude
- A Heading-to-an-Altitude (VA) leg that defines a heading to follow to an altitude
- A Holding-to-an-Altitude (HA) leg that defines a holding pattern to an altitude

The turn direction (left or right) that is coded on a leg indicates that the aircraft has to execute a turn in the specified direction to intercept the leg.
In some very specific operational conditions (aircraft weight, wind...), the FMS may predict that the aircraft will reach the altitude that terminates the leg, before the initiation of the leg. In that case, the FMS ignores the leg, and the associated turn direction.
The FMS computes a new trajectory to directly join the next leg. The trajectory may not be consistent with the published trajectory.

Example:

- Leg 1: a Course-to-Fix (CF) leg that defines a track (360 °) to a waypoint (WPT1)
- Leg 2: a Course-to-an-Altitude (CA) leg that defines a track (130 °) to intercept an altitude (3 000 ft). The leg is coded in the Navigation Database with a turn direction (left). The end of the leg depends on the aircraft performance. The turn direction is indicated by an arrow on the line of leg 1 on the MCDU
- Leg 3: a CF leg that defines a track (120 °) to a waypoint (WPT2)



Erroneous Trajectory Displayed on ND
WPT1
TRK 360°
TRK 130° until 3000ft
Trajectory Published on the Chart
TRK 120°
WPT2
Runway

Depending on the aircraft performance, the FMS may predict that the aircraft will reach 3 000 ft before WPT1. In that case, the FMS ignores the leg 2 (CA leg) because the aircraft is already above the altitude that ends leg 2, before the beginning of leg 2. The FMS also ignores the turn direction that is coded on the leg.

As a result, the FMS computes again the trajectory from the end of leg 1, directly to leg 3. As shown on the above illustration, this trajectory includes a right turn, instead of a left turn, because it induces the shortest course change to intercept leg 3 (CF leg).

If the NAV mode is engaged, the aircraft follows this erroneous trajectory.

OPERATIONAL RECOMMENDATIONS

The flight crew should pay particular attention to the check of the flight plan during the Cockpit Preparation, and during the Descent Preparation.

CAUTION	Even if the flight plan is correct during the Cockpit Preparation or during the Descent Preparation, the FMS may compute and display an erroneous trajectory when the FMS updates its predictions after takeoff or after go-around initiation.

If the flight crew detects that the lateral flight plan does not agree with the published trajectory, the flight crew should revert to the HDG/TRK mode, and monitor NAVAID raw data as appropriate.

The flight crew should reengage the NAV mode when the lateral flight plan is consistent with the published trajectory.

ERRONEOUS TRAJECTORY WHILE IN HDG (TRK) MODE DURING PROCEDURES WITH A TURN DIRECTION ON A LEG WITH AN ALTITUDE TERMINATION

Ident.: DSC-22_20-100-20-00023970.0003001 / 26 NOV 19

Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

DESCRIPTION

In some very specific operational conditions that depend on the coding in the Navigation Database of the procedure, and on various performance conditions (aircraft weight, flaps, thrust setting, temperature, wind ...), the FMS may compute an erroneous trajectory.

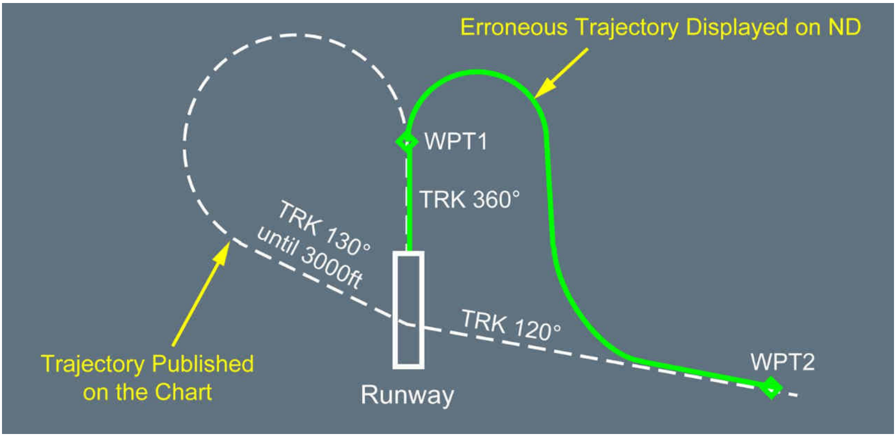
The SIDs and the Missed Approach procedures that may be affected are coded in the Navigation Database with a leg that has a turn direction and an altitude termination. The leg can be one of the following:
- A Course-to-an-Altitude (CA) leg that defines a course to follow to an altitude
- A Fix-to-an-Altitude (FA) leg that defines a track to follow from a waypoint to an altitude
- A Heading-to-an-Altitude (VA) leg that defines a heading to follow to an altitude
- A Holding-to-an-Altitude (HA) leg that defines a holding pattern to an altitude.

The turn direction (left or right) that is coded on a leg indicates that the aircraft has to execute a turn in the specified direction to intercept the leg.
In some very specific operational conditions, the FMS may predict that the aircraft will reach the altitude that terminates the leg, before the initiation of the leg. In that case, the FMS ignores the leg and the associated turn direction.
The FMS computes a new trajectory to directly join the next leg. The trajectory may not be consistent with the published trajectory.
The abnormal behavior depends on the AP/FD lateral modes engaged.

After takeoff, the NAV mode engages. At any time before the end of the altitude termination leg:
- If the NAV mode stays engaged, the FMS will compute a trajectory consistent with the published trajectory
- If the HDG/TRK mode is engaged, the FMS may compute an erroneous trajectory and display it on the ND. If the flight crew engages the NAV mode, the aircraft will follow the erroneous trajectory.

Example:
- Leg 1: A Course-to-Fix (CF) leg that defines a track (360 °) to a waypoint (WPT1)
- Leg 2: A Course-to-an-Altitude (CA) leg that defines a track (130 °) to intercept an altitude (3 000 ft). The leg is coded in the Navigation Database with a turn direction (left). The end of the leg depends on the aircraft performance. The turn direction is indicated by an arrow on the line of leg 1 on the F-PLN page of the MCDU.
- Leg 3: A CF leg that defines a track (120 °) to a waypoint (WPT2).

Erroneous trajectory on ND



Erroneous Trajectory Displayed on ND
WPT1
TRK 360°
TRK 130° until 3000ft
TRK 120°
WPT2
Trajectory Published on the Chart
Runway

Depending on the aircraft performance, the FMS may predict that the aircraft will reach 3 000 ft before WPT1. In that case, if the HDG/TRK mode is engaged, the FMS ignores the leg 2 (CA leg) because the aircraft is already above the altitude that ends leg 2, before the beginning of leg 2. The FMS also ignores the turn direction that is coded on the leg.
As a result, the FMS computes again the trajectory from the end of leg 1, directly to leg 3. As shown on the above illustration, this trajectory includes a right turn, instead of a left turn, because it induces the shortest course change to intercept leg 3 (CF leg). This erroneous trajectory will be displayed on the ND.
If flight crew reengages the NAV mode before the end of the altitude termination leg, the aircraft follows this erroneous trajectory.

OPERATIONAL RECOMMENDATIONS

The flight crew should pay particular attention to the check of the flight plan during the Cockpit Preparation, and during the Descent Preparation.

CAUTION	Even if the flight plan is correct during the Cockpit Preparation or during the Descent Preparation, the FMS may compute and display an erroneous trajectory when the FMS updates its predictions after takeoff or after go-around initiation.

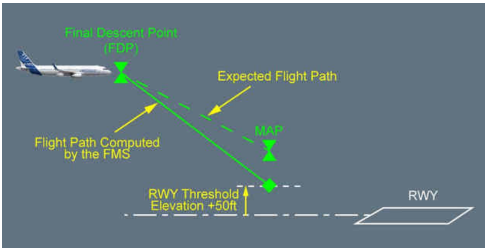
When in HDG/TRK mode after takeoff or go around initiation, if the flight crew detects that the lateral flight plan does not agree with the published trajectory, the flight crew should keep the HDG/TRK mode engaged, and monitor NAVAID raw data as appropriate.
The flight crew should only reengage the NAV mode when the lateral flight plan is consistent with the published trajectory.

ERRONEOUS VERTICAL PROFILE DURING LOC B/C APPROACHES WITH MAP LOCATED BEFORE THE RUNWAY THRESHOLD

Ident.: DSC-22_20-100-20-00019854.0004001 / 25 JUL 16
Applicable to: ALL

DESCRIPTION

When the flight crew selects a LOC Back Course (LOC B/C) approach in the arrival page of the MCDU, if the Missed Approach Point (MAP) is located before the runway threshold, the FMS builds the final approach vertical flight path assuming that there is an altitude constraint at the MAP, equal to the runway (RWY) threshold elevation plus 50 ft, disregarding the actual coded MAP altitude.
As a result, the FMS computes an erroneous vertical flight path for the final approach, an erroneous crossing altitude at the MAP, and displays an erroneous vertical deviation indication (V/DEV symbol on the PFD and V/DEV value on MCDU PROG page), when flying the approach.



Therefore, the flight crew must fly the LOC B/C approaches in selected vertical guidance mode (FPA or V/S mode), and they must disregard the V/DEV displayed on the PFD and MCDU PROG page.

PROCEDURE

For LOC B/C approaches, check the position of the MAP on the approach chart:

- **If the MAP is located at the runway threshold:**
  V/DEV symbol can be used to assist the flight crew in flying the vertical flight path in selected mode. Crosscheck the final descent with the published chart using altitude versus distance, as per Standard Operating Procedures (SOPs).

- **If the MAP is located before the runway threshold:**
  DISREGARD the V/DEV symbol, and crosscheck the final descent using the altitude versus the distance to the MAP.

ERRONEOUS VERTICAL GUIDANCE IN APPROACH SUBSEQUENT TO A DIR TO PERFORMED WHEN NEAR THE TOP OF DESCENT

Ident.: DSC-22_20-100-20-00023138.0001001 / 05 MAR 19
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

DESCRIPTION

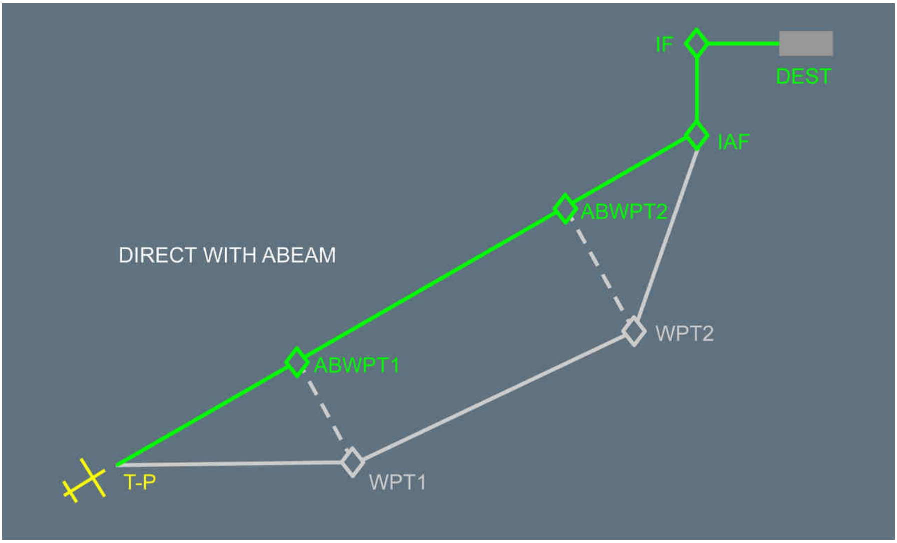
When the flight crew inserts a DIR TO waypoint, the FMS computes the horizontal path to the destination. When near the top of descent, if the flight crew inserts a DIR TO waypoint that is at, or after the IAF, the FMS computation may be erroneous for all of the following:

- The distance of the legs after the DIR TO waypoint.
- The vertical deviation on the legs after the DIR TO waypoint.
- The vertical guidance in DES and FINAL APP modes.

In order to compute the turn radius of the horizontal path, the FMS uses the current TAS at the time of the DIR TO insertion.This is the cause to the erroneous calculation. Instead, the FMS should use the TAS that is predicted at the DIR TO waypoint.

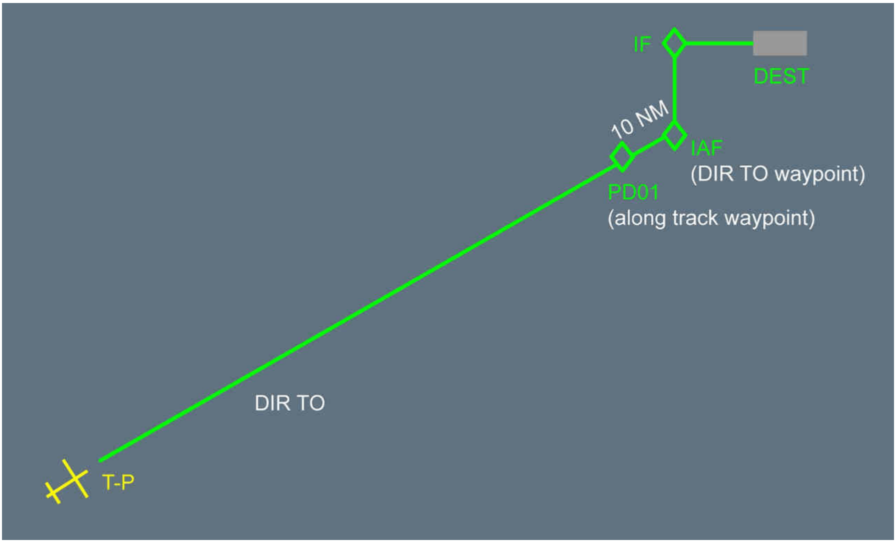
PROCEDURE

When near the top of descent, to insert a DIR TO waypoint that is at or after the IAF, the flight crew should use the DIRECT WITH ABEAM (ABEAM PTS) function. The flight crew must then check that at least one abeam waypoint is computed ahead of the position of the aircraft.
For more information on the DIRECT WITH ABEAM function, *Refer to DSC-22_20-30-10-15 DIR Key (Direct-TO-Function) - Procedure for DIR TO/Abeam*.



IF
DEST
IAF
ABWPT2
DIRECT WITH ABEAM
WPT2
ABWPT1
T-P
WPT1

If there is no abeam waypoint computed, the flight crew must insert a Place Distance waypoint 10 NM before the DIR TO waypoint (*Refer to DSC-22_20-30-10-15 Inserting a Waypoint - Along Track Waypoint Insertion*).



NO ENGAGEMENT OF THE PRESEL SPD TARGET IN CLIMB

Ident.: DSC-22_20-100-20-00023870.0002001 / 26 NOV 19
Applicable to: ALL

DESCRIPTION

This misbehavior is experienced if the flight crew entered a PRESEL SPD TARGET in the FMS PERF CLIMB page and when the following occurs simultaneously:
- FMS transition from TAKEOFF to CLIMB phase, and
- A F-PLN leg is sequenced by the FMS.

EXPLANATION

The FMS transition from TAKEOFF to CLIMB phase occurs in the following cases:
- The aircraft reaches the ACCEL ALT entered in the FMS PERF TAKEOFF page, or
- The SRS mode disengages and another vertical mode such as ALT* engages.

At the activation of the CLIMB phase, when a PRESEL SPD TARGET is set in the FMS PERF CLIMB page and A/THR is active, the FMS orders to synchronize the FCU SPD target to the preselected value and go to selected SPD mode automatically.
When a F-PLN leg is sequenced at the same time than the activation of the CLIMB phase, the FMS gives the priority to the leg sequencing process. Then, the PRESEL SPD TARGET is not taken into account. In such condition the PRESEL SPD TARGET entered in the FMS PERF

CLIMB page is disregarded and the aircraft accelerates to reach the MANAGED SPD TARGET displayed on the FMS PERF CLIMB page.

OPERATIONAL RECOMMENDATION

If the PRESEL SPD TARGET is not taken into account after the FMS transition from TAKEOFF to CLIMB phase, the flight crew should revert to selected speed mode and select the SPD TARGET on the FCU.

ERRONEOUS CF LEG COMPUTATION FOLLOWING FMS NEW RUNWAY WITH LS IDENT CREATION

Ident.: DSC-22_20-100-20-00023918.0005001 / 26 NOV 19
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

DESCRIPTION

The flight crew may experience this abnormal behavior if a runway and its associated LS IDENT is created via the FMS NEW RUNWAY page.

If the flight crew creates a runway and its associated LS (LS IDENT of the FMS NEW RUNWAY page), the FMS considers this NAVAID as the recommended NAVAID for the newly created runway.
This created NAVAID does not have an associated magnetic variation in the FMS. Thus, the FMS may apply an erroneous magnetic variation and may compute an erroneous course for the CF leg.

OPERATIONAL RECOMMENDATION

In the case of runway creation, the flight crew should not insert an LS IDENT on the FMS NEW RUNWAY page.

If the flight crew plans to perform an ILS approach on the newly created runway, the ILS should be tuned via either of the following:
- The FMS RADIO NAV page, or
- The RMP.

ERRONEOUS MANAGED APPROACH SPEED AFTER DESCENT WIND UPLINK

Ident.: DSC-22_20-100-20-00024191.0002001 / 28 MAY 20
Applicable to: ALL

DESCRIPTION

This misbehaviour is encountered in the following conditions:
- The flight crew inserts the uplink of an AOC DESCENT WIND that contains wind at destination (GRND wind appears on the DESCENT WIND page)
- The flight crew does not manually reinsert the wind at destination on the PERF APPR page.

In the case of the uplink of an AOC DESCENT WIND that contains wind at destination (GRND wind appears on the DESCENT WIND page), all of the following apply:
- The FMS correctly receives and uses the wind at destination
- The wind at destination correctly appears on the PERF APPR page
- The FMS erroneously transmits the wind at destination to the Flight Guidance Computer for GSmini computation.

As a result, the managed approach speed that appears on PFD and which is used for guidance by the Flight Guidance Computer may be erroneously increased, depending on the current headwind that the flight crew encounters.

OPERATIONAL RECOMMENDATION

Starting from the DESCENT PREPARATION phase of the Standard Operating Procedures, the flight crew should manually reenter the wind at destination on the PERF APPR page, each time an uplink of an AOC DESCENT WIND that contains wind at destination (GRND wind appears on DESCENT WIND page) is performed. And this recommendation applies whatever the value of the wind at destination, which appears on the PERF APPR page, subsequent to the uplink. This applies even if the value to reenter on the PERF APPR page is exactly the same value.

UNEXPECTED ILS AUTO-TUNING

Ident.: DSC-22_20-100-20-00024494.0005001 / 09 MAY 23
Applicable to: LV-KHT, LV-KHU

DESCRIPTION

The FMS may erroneously automatically tune an ILS frequency in the following two cases:
- After selection of an ILS approach, the flight crew changes the approach and selects a RWY-only or Visual approach that is not associated with an ILS frequency, or
- The flight crew selects a RWY-only approach that is associated with an ILS frequency.

OPERATIONAL RECOMMENDATIONS

If the flight crew identifies an unexpected tuning of an ILS frequency by the FMS, the flight crew should insert the ILS frequency 108.00 in the FMS RADIO NAV page.

WARNING	Do not insert or clear ILS FREQ or CRS on both FMS sides simultaneously.

Note: 1. *108.00 is the default value of ILS frequency that is not associated with an ILS approach.*
2. *Inserting the CRS on one FMS side while the LS FREQ is cleared on the other FMS side results in dual FMS latch.*

LOSS OF FMS PREDICTIONS IN LOW DENSITY OF AIRPORTS

Ident.: DSC-22_20-100-20-00025961.0001001 / 03 NOV 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

DESCRIPTION

The FMS may encounter temporary and repetitive loss of predictions in the flight plan of the MCDU during flight, if the FMS finds only 4 airports in the Navigation Database within 1 200 NM from the aircraft position.
The occurrence rate increases when the flight crew enters a 5th airport on [5L] key of the CLOSEST AIRPORTS page.

Note: *During the occurrence, the UTC fields of the 4th and 5th (when entered) airports are dashed in the CLOSEST AIRPORTS page.*

The loss of the time prediction for more than 5 minutes can trigger a FWD fuel transfer from the TRIM tank.

OPERATIONAL RECOMMENDATION

The flight crew should clear the 5th airport in the CLOSEST AIRPORTS page to recover the full FMS predictions.
To avoid new occurrences in flight, the operator should request the FMS supplier to modify the Navigation Database to increase the number of available airports, on the flight routes affected by the loss of predictions. A minimum of 5 airports must be available within 1 200 NM of all expected flight plans.

TAB - INADVERTENT T.O. SPEEDS REVERSION UPON RWY CHANGE

1 Ident.: DSC-22_20-100-20-00026557.0001001 / 30 JAN 24
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

DESCRIPTION

In the case of a runway change, the FMS may erroneously revert to the previous takeoff speeds when all the following occurs:

- Both MCDUs display the PERF TAKEOFF page,
- V1, VR and V2 associated with the previous runway are already entered,
- The new runway is entered in one MCDU,
- V1, VR and V2 associated with the new runway are entered by one flight crew member,
- The other flight crew member presses the 6R prompt (NEXT PHASE) of the PERF TAKEOFF page.

OPERATIONAL RECOMMENDATIONS

If the PERF TAKEOFF page is displayed on both MCDUs, when the new takeoff speeds are entered on one MCDU, the flight crew should not press the 6R prompt (NEXT PHASE) on the other MCDU.
The flight crew should apply the DEPARTURE CHANGE SOP and complete the DEPARTURE CHANGE checklist to ensure that correct speeds and thrust are set for the takeoff.

DSC-22_30-110 Temporary Abnormal Behaviors

Misbehaviour of the enhanced LOC capture........ A

GENERAL

Ident.: DSC-22_30-10-00019224.0001001 / 18 MAY 22
Applicable to: ALL

The Flight Guidance (FG) provides the following functions:
- The Flight Director (FD)
- The Autopilot (AP)
- The Autothrust (A/THR).

The FG operates by using the following modes:
- AP/FD lateral modes to control the lateral trajectory
- AP/FD vertical modes to control the vertical trajectory, or the speed or Mach
- A/THR modes to control the speed or Mach, or the thrust.

Speed or Mach cannot be simultaneously controlled by the AP/FD and the A/THR.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-20-10-00019225.0001001 / 18 MAY 22
Applicable to: ALL

The FD displays guidance orders on the PFD:
- If no AP is engaged, the flight crew can manually fly the aircraft by following FD orders, or
- If at least one AP is engaged, the flight crew can use the FD to monitor the FG.

There are two FDs referred to as FD1 and FD2. In normal operation:
- PFD1 displays FD1 guidance orders, computed by FMGEC1
- PFD2 displays FD2 guidance orders, computed by FMGEC2.

Intentionally left blank

MANUAL ENGAGEMENT

Ident.: DSC-22_30-20-20-00019234.0001001 / 04 MAY 23
Applicable to: ALL

The flight crew manually engages the onside FD by pressing the onside FD pb.

Note: *If the flight crew did not previously engage any AP or FD, then HDG or TRACK, and V/S or FPA engage. The FD symbol flashes for 10 s.*

AUTOMATIC ENGAGEMENT

Applicable to: ALL

Ident.: DSC-22_30-20-20-A-00019235.0001001 / 18 MAY 22

ON GROUND

FD1 and FD2 automatically engage at aircraft power-up.

IN FLIGHT

FD1 and FD2 automatically engage in flight, if:
- The flight crew engages the SRS GA mode, or
- The AP/FD TCAS mode engages upon a RA.

Ident.: DSC-22_30-20-20-A-00019856.0002001 / 18 MAY 22

Note: *On SRS engagement, if the flight crew previously selected the FPV/FPD display, the FD symbol reverts to vertical and horizontal bars.*

ENGAGEMENT ANNUNCIATION

Ident.: DSC-22_30-20-20-00019408.0001001 / 18 MAY 22
Applicable to: ALL

If FD1 and/or FD2 engages, all the following events occur:
- The associated FD pb on the FCU comes on
- The xFDy message appears in the "AP, FD, A/THR Engagement Status" column of both FMAs.

Intentionally left blank

FD SYMBOLOGY - DISPLAY

Ident.: DSC-22_30-20-30-00019229.0001001 / 18 MAY 22
Applicable to: ALL

The pitch, roll, and yaw bars respectively indicate the pitch, roll, and yaw FD guidance orders.

Note: *Independently from FD display, the FPV can be displayed on the PFDs. The FPV does not indicate guidance orders.*
For definition and display conditions of the FPV, Refer to DSC-31-40 Flight Path Vector

When the FDs are engaged, the PFDs can display the pitch, roll, and yaw symbologies.
Refer to DSC-31-40 Guidance

DISPLAY CONDITIONS OF THE GUIDANCE SYMBOLOGY, WHEN THE FDS ARE ENGAGED:

FOR LATERAL GUIDANCE

The PFD displays the roll bar when a lateral mode is engaged.

The PFD displays a yaw bar that replaces the roll bar in green below 30 ft radio height if a localizer signal is available during:
- Takeoff in RWY mode, or
- Landing in FLARE and ROLL OUT modes.

FOR VERTICAL GUIDANCE

The PFD displays the pitch bar after liftoff, when a vertical mode is engaged.

IN FLIGHT, IN TRK-FPA MODE

The FPD replaces both FD bars.
The FPD symbol shows the flight crew how to intercept and fly the vertical and lateral flight trajectory.
For more information about the FPD, *Refer to DSC-31-40 Guidance*

Intentionally left blank

FD SYMBOLOGY - NON DISPLAY

Ident.: DSC-22_30-20-40-00025304.0001001 / 18 MAY 22
Applicable to: ALL

If the FDs are not engaged, the PFDs do not display the FD symbology.

The FD bars disappear, when one of the following occurs:
- The aircraft bank angle exceeds 45 °, or
- The aircraft pitch exceeds 25 ° up or 13 ° down.

The pitch bar disappears in ROLL OUT.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-20-50-00019651.0001001 / 18 MAY 22
Applicable to: ALL

If all FDs disengage while no AP is engaged, all the following occur:
- The lateral and vertical modes disengage, and
- If engaged, the A/THR reverts to (or remains in) SPEED or MACH mode.

If all FDs disengage while at least one AP is engaged, all the following occur:
- The lateral and vertical modes remain engaged, and
- If engaged, the A/THR remains engaged in the current mode.

MANUAL DISENGAGEMENT

Ident.: DSC-22_30-20-50-00019438.0001001 / 18 MAY 22
Applicable to: ALL

The flight crew can manually press the onside FD pb to disengage the onside FD.

AUTOMATIC DISENGAGEMENT

Applicable to: ALL

Ident.: DSC-22_30-20-50-A-00019437.0001001 / 18 MAY 22

The FD disengages if, in ROLL OUT, the difference between the aircraft track and the runway track is more than 20 °.

DUE TO FAILURES

The FD disengages if one of the following occurs:
- The FD becomes inoperative, or
- The FCU is not available, or
- All the engines fail.

DUE TO SPEED PROTECTION

The FD disengages if no AP is engaged and the aircraft speed is either:
- below VLS in DES or OP DES, or
- above VMAX in CLB or OP CLB.

Note: *After the FD disengages, the A/THR reverts to SPEED or MACH mode and adjusts the thrust to recover the target speed or keep the speed within the range from VLS to VMAX, if the target speed is out of this range.*

DISENGAGEMENT ANNUNCIATION

Ident.: DSC-22_30-20-50-00019441.0001001 / 18 MAY 22
Applicable to: ALL

If the flight crew disengages one FD, all the following occur:
- The corresponding FD pb goes off,
- The FD symbol no longer appears on the associated PFD,
- 1FD- appears on the FMA if FD2 is disengaged or -FD2 if FD1 is disengaged.

If one FD fails, all the following occur:
- All FD pb remain on,
- Both PFDs display the guidance orders from the remaining FD,
- 1FD1 appears on the FMA if FD2 fails, or 2FD2 if FD1 fails.

FD BARS FLASHING

Ident.: DSC-22_30-20-60-00019652.0001001 / 04 MAY 23
Applicable to: ALL

PITCH BAR

The pitch bar (or FPV) flashes for 10 s and remains steady, if one of the following occurs:
- An automatic reversion to V/S (or FPA) mode occurs, or
- All APs and FDs are previously disengaged and the flight crew engages the FD.

The pitch bar (or FPV) flashes, if, during approach, the MMR is not able to compute the vertical deviation above 100 ft RA.

ROLL BAR

The roll bar (or FPV) flashes for 10 s and remains steady, if one of the following occurs:
- An automatic reversion to HDG (or TRACK) mode occurs, or
- All APs and FDs are previously disengaged and the flight crew engages the FD.

The roll bar (or FPV) flashes if, during approach, the MMR is not able to compute the lateral deviation above 15 ft RA.

FD FLAG

Ident.: DSC-22_30-20-60-00019556.0001001 / 18 MAY 22
Applicable to: ALL

If the guidance orders are not available while the FD is engaged, a FD flag appears on the PFD and the FD bars disappear.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-30-10-00019227.0001001 / 18 MAY 22
Applicable to: ALL

The AP:
- Stabilizes the aircraft around its center of gravity
- Controls the lateral trajectory
- Controls the vertical trajectory, or speed/Mach
- Coordinates with the A/THR
- Performs the automatic landing, or the go-around.

The AP generates:
- Pitch, roll, and yaw orders
- The nosewheel angle.

There are two APs: AP1 and AP2.
AP1 uses system data displayed on PFD1, and AP2 uses system data displayed on PFD2.

Intentionally left blank

INTRODUCTION

Ident.: DSC-22_30-30-20-00019251.0001001 / 04 MAY 23
Applicable to: ALL

When an AP engages, the sidesticks are locked in the neutral position, and the force to move the rudder pedals increases. However, the flight crew can always disengage the APs and the locking devices.
The APs engage with the same guidance mode previously used by the FD.
If the FDs were not previously engaged, the AP engages in HDG or TRACK, and V/S or FPA.
L2 The APs are available in normal and alternate law, only.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-30-20-A-00019252.0001001 / 18 MAY 22

ENGAGEMENT OF ONE AP

One AP engages when the flight crew presses the AP1 pb or the AP2 pb on the FCU, and the aircraft is in flight for more than 5 s.
In BACK-UP NAV, the AP engages in selected modes if the FG part is available.
The AP engages only if the aircraft pitch, bank angle, and speed are within an acceptable range.

Ident.: DSC-22_30-30-20-A-00019267.0001001 / 18 MAY 22

ENGAGEMENT OF BOTH APS

When one AP is engaged, the flight crew can press the second AP pb to engage the second AP.

However, the second AP can engage only when one of the following conditions is applicable:
- LOC is armed, or LOC* or LOC is engaged, and
- G/S is armed, or G/S* or G/S is engaged
- Go-around is engaged.

When both APs are engaged, AP1 is active, and AP2 is on standby, regardless of the order of AP engagement.

ENGAGEMENT ANNUNCIATION

Ident.: DSC-22_30-30-20-00022474.0001001 / 18 MAY 22
Applicable to: ALL

When AP1(2) engages, all the following events occur:

- The associated AP1(2) pb on the FCU comes on
- Both FMAs display:
  - AP1 (AP2)
  - AP1+2, if both APs are engaged.

MANUAL DISENGAGEMENT

Applicable to: ALL

Ident.: DSC-22_30-30-30-A-00019346.0001001 / 18 MAY 22

The APs disengages if one of the following occurs:

- The flight crew presses the takeover pb on the sidestick, or
- The flight crew presses the AP1(2) pb on the FCU, or
- The flight crew moves the pitch trim wheel beyond a certain threshold, or
- The flight crew moves a sidestick above a specific threshold, or

Ident.: DSC-22_30-30-30-A-00019347.0001001 / 18 MAY 22

- On ground, the flight crew moves the rudder pedals above a specific threshold, or

Ident.: DSC-22_30-30-30-A-00019348.0001001 / 18 MAY 22

- On ground, the flight crew sets all the thrust levers above the MCT detent.

Airbus recommends to press the sidestick pb two times to disengage both APs.
L2 One time to disengage the APs, the second time to clear the associated AP OFF alert.
L1 The other ways of disengagement are to be avoided. In particular, the disengagement of the APs with the sidestick, or the rudder pedal deflection is very uncomfortable for passengers.

AUTOMATIC DISENGAGEMENT

Ident.: DSC-22_30-30-30-B-00022475.0001001 / 18 MAY 22
Applicable to: ALL

The APs automatically disengage, if one of the following occurs:

- One of the engagement conditions is lost, or

Ident.: DSC-22_30-30-30-B-00024972.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP

- During an approach with FINAL APP mode engaged, the aircraft reaches:
  - The MAP, or
  - The MDA/MDH -50 ft (if entered), or 400 ft AGL (if no MDA/MDH is entered).

Ident.: DSC-22_30-30-30-B-00024972.0002001 / 18 MAY 22
Applicable to: LV-KHT, LV-KHU

- During an approach with FINAL APP mode engaged, the aircraft reaches the MAP.

Ident.: DSC-22_30-30-30-B-00019354.0001001 / 18 MAY 22
Applicable to: ALL

In addition, in normal law with all protections available, the APs will disengage when:
- High speed protection activates, or
- Angle-of-attack protection activates, or
- Pitch attitude exceeds 25 ° up, or 13 ° down, or bank angle exceeds 45 °.

When the AP is OFF, the associated FCU pb goes off, and AP1 (AP2) disappears from the FMA.

DISENGAGEMENT ANNUNCIATIONS AND WARNINGS

Ident.: DSC-22_30-30-30-00019375.0001001 / 04 MAY 23
Applicable to: ALL

When AP1(2) disengages, all the following events occur:
- The associated AP1(2) pb on the FCU goes off
- On both FMAs, the AP 1 (AP 2) message disappears.

DISCONNECTION VIA THE takeover pb

The normal way to disconnect the AP is to press the takeover pb two times.

When the flight crew presses the takeover pb for the first time, the following warnings are triggered, and will continue, until the flight crew presses the takeover pb a second time:
- The AP OFF memo appears on the E/WD
- A cavalry charge audio indicator sounds
- The MASTER WARN light comes on.

When the flight crew presses the takeover pb the second time or the MASTER WARN light, all the above warnings are cleared.

If the flight crew does not quickly press the takeover pb a second time, the following additional warnings will trigger:
- The cavalry charge audio indicators sounds
- The AUTO FLT AP OFF alert is displayed on the E/WD.

When the flight crew presses the MASTER WARN light, or the takeover pb a second time, the cavalry charge audio indicator stops and the memos disappear, but the AUTO FLT AP OFF remains displayed.

OTHER WAYS OF DISCONNECTION

If the AP disengages, without any flight crew action on the takeover pb, the following warnings will trigger:
- A cavalry charge audio indicator sounds
- The AUTO FLT AP OFF alert is displayed on the E/WD.

When the flight crew presses the MASTER WARN light, or the takeover pb (one time), the cavalry charge stops and the memo disappears, but the alert remains displayed.

Intentionally left blank

INTRODUCTION

Ident.: DSC-22_30-40-10-00019380.0001001 / 18 MAY 22
Applicable to: ALL

The AP/FD modes are either lateral, vertical, or common.

Two types of AP/FD modes are available in order to guide the aircraft:
- Managed modes: when the aircraft is using managed targets, the FMGES guides the aircraft along lateral and vertical flight paths and speed profiles computed by the FM from data in the MCDU. FM manages the guidance targets.
- Selected modes: when the flight crew is using selected targets, the FMGES guides the aircraft along lateral and vertical flight paths and speed profiles to meet targets that the flight crew has selected manually on the FCU. The flight crew selects the guidance targets.

AP/FD LATERAL MODES

Applicable to: ALL

MODE	TYPE	GUIDANCE	REMARK

Ident.: DSC-22_30-40-10-A-00019383.0001001 / 04 MAY 23

RWY	MANAGED	Runway mode Mode used at takeoff to guide the aircraft along the runway center line using LOC.	Triggered by the thrust levers at FLX or TOGA position.
RWY TRK	MANAGED	Runway Track mode Mode used to guide the aircraft along the track the aircraft was following at the mode engagement.	
HDG, TRACK	SELECTED	Heading mode, Track mode Mode used to guide the aircraft on a heading or a track selected by the flight crew. The target value is displayed in the FCU window.	_Note:_ *HDG, TRACK are called "basic modes" because it is a back up mode for certain situations :* - *F-PLN discontinuity entry* - *AP engagement with no FD* - *Loss of F-PLN* - *MCDU BACK UP NAV.*

Ident.: DSC-22_30-40-10-A-00019389.0001001 / 06 NOV 23

NAV	MANAGED	Navigation mode Mode used to guide the aircraft along the lateral F-PLN. Available above 30 ft after takeoff.	Automatically armed at takeoff unless HDG,TRK is preset. In that case RWY TRK engages after takeoff.
LOC* **LOC**	MANAGED	Localizer capture mode Localizer track mode Mode used to guide the aircraft on the lateral approach path (LOC approach path).	Selected by pressing APPR pb or LOC pb on the FCU.
F-LOC* ◁ **F-LOC** ◁	MANAGED	Flight Management Landing System Localizer capture mode Flight Management Landing System Localizer track mode Mode used to guide the aircraft on the lateral approach path (F-PLN approach path).	Selected by pressing APPR pb or LOC pb on the FCU.

Continued on the following page

Continued from the previous page

MODE	TYPE	GUIDANCE	REMARK
LOC B/C * **LOC B/C**	MANAGED	Localizer Back Course capture mode Localizer Back Course track mode Mode used to guide the aircraft on the back beam of a localizer.	Selected by LAT REV at destination. Activated by pressing the LOC pb on the FCU.
GA TRK	MANAGED	Go-Around track mode Mode used to guide the aircraft along the track the aircraft was following at the mode engagement.	Triggered by the thrust levers at TOGA with Slats/Flaps in at least CONF 1.

Ident.: DSC-22_30-40-10-A-00019388.0001001 / 18 MAY 22

APP NAV	MANAGED	Approach Nav mode Mode used to guide the aircraft on the lateral approach path.	Selected by pressing APPR pb on the FCU; the mode that engages depends upon the selected approach in the F-PLN.

AP/FD VERTICAL MODES

Applicable to: ALL

Ident.: DSC-22_30-40-10-B-00019359.0001001 / 04 MAY 23

MODE	TYPE	GUIDANCE	REMARK
SRS	MANAGED	Speed Reference System mode Mode used at takeoff, or go-around to maintain SRS speed (V2, V2+10, VAPP...).	Triggered by the thrust levers at FLX or TOGA position. Automatically disengages at ACCEL ALT, or when another VERT mode is engaged.
OP CLB	SELECTED	Open Climb mode Mode used to climb directly to the FCU selected altitude. These modes disregard all ALT CST. The A/THR is in THRUST mode (CLB).	The speed target may either be selected or managed. ALT mode is systematically armed. Altitude target is blue on the PFD.
CLB	MANAGED	Climb mode Mode used to climb towards FCU selected altitude along VERT F-PLN taking into account ALT CST. Available, only if NAV mode engaged. The A/THR is in THRUST mode (CLB).	The speed target may either be selected or managed. If managed, SPD CST, SPD LIM, and HOLD SPD are taken into account. ALT mode is always armed, and the FMA displays: - ALT CST if the next level off is predicted at an ALT CST, or - ALT if the next level off is predicted at the FCU selected altitude.
ALT* **ALT**	SELECTED	Altitude acquire mode Altitude hold mode Mode used to maintain a level flight at the FCU selected altitude.	
ALT CST* **ALT CST**	MANAGED	Altitude Constraint capture mode Altitude Constraint hold mode Mode automatically engaged when reaching an ALT CST before the FCU selected altitude.	CLB/DES mode are systematically armed.
ALT CRZ* **ALT CRZ**	SELECTED	Altitude capture of the cruise flight level Altitude hold of the cruise flight level Mode used to maintain the cruise level flight.	A/THR SOFT mode engages when FCU selected altitude = CRZ FL. A/THR SOFT mode is part of the managed guidance.

Continued on the following page

Continued from the previous page

MODE	TYPE	GUIDANCE	REMARK
OP DES	SELECTED	Open Descent mode Mode used to descend directly to the FCU selected altitude. These modes disregard all ALT CST. The A/THR is in THRUST mode (IDLE).	The speed target may either be selected or managed. ALT mode is systematically armed. Altitude target is blue on the PFD.
DES	MANAGED	Descent mode Mode used to descend towards FCU selected altitude along the computed descent path, taking into account ALT CST. Available, only if NAV mode engaged. The A/THR may be in THRUST, or SPD mode.	The speed target may either be selected or managed. If managed, SPD CST, SPD LIM, and HOLD SPD are taken into account. ALT mode is always armed, and the FMA displays: - ALT CST if the next level off is predicted at an ALT CST, or - ALT if the next level off is predicted at the FCU selected altitude.
V/S, FPA	SELECTED	Vertical Speed mode, Flight Path Angle mode Mode used to guide the aircraft by a vertical speed, or a selected flight path angle.	Altitude target is blue on PFD. V/S-FPA is a basic mode.
G/S* **G/S**	MANAGED	Glide Slope capture mode Glide Slope track mode Mode used to guide the aircraft along the final approach path (ILS/GLS ◁ /SLS ◁ (RNAV(GNSS) approach with LPV minima guidance mode).	Selected by pressing APPR pb on the FCU.
F-G/S* ◁ **F-G/S** ◁	MANAGED	Flight Landing System Glide Slope capture mode Flight Landing System Glide Slope track mode Mode used to guide the aircraft along the final approach path (FLS ◁ approach).	Selected by pressing APPR pb on the FCU.

Ident.: DSC-22_30-40-10-B-00019360.0001001 / 18 MAY 22

FINAL	MANAGED	Final mode Mode used to guide the aircraft along the final approach path (non precision approach)	Selected by pressing the FCU's APPR pb. The mode engaged depends upon the selected approach in the F-PLN. Linked to APPR common mode (APPR pb).

Continued on the following page

Continued from the previous page

Ident.: DSC-22_30-40-10-B-00019361.0001001 / 18 MAY 22

MODE	TYPE	GUIDANCE	REMARK
AP/FD TCAS ◁✱	MANAGED	Mode used to guide the A/C in the case of TCAS RA	Automatically engaged when a RA is triggered.

AP/FD COMMON MODES

Applicable to: ALL

Ident.: DSC-22_30-40-10-C-00019387.0001001 / 18 MAY 22

MODE	TYPE	GUIDANCE	REMARK
LAND	MANAGED	Land mode Common mode engaged below 400 ft RA during an automatic ILS/GLS /SLS (RNAV(GNSS) approach with LPV minima guidance mode) approach.	Engaged only if LOC mode and G/S mode are already engaged.
FLARE	MANAGED	Flare mode Common mode which provides alignment to the runway centerline on the yaw axis, and flare on the pitch axis.	Engaged below 60 ft RA, based on the current vertical speed.
ROLL OUT	MANAGED	Roll Out mode Mode used to guide the aircraft on the runway following an automatic landing.	FD roll out symbol is displayed on PFD at touch down.

Ident.: DSC-22_30-40-10-C-00020292.0001001 / 18 MAY 22

MODE	TYPE	GUIDANCE	REMARK
FINAL APP	MANAGED	Final Approach mode Common mode including APP NAV and FINAL modes during non-precision approach.	Engaged only if APP- NAV mode and FINAL mode are already armed.

AP/FD MODE STATUS AND DISPLAY

Ident.: DSC-22_30-40-10-00019381.0001001 / 18 MAY 22
Applicable to: ALL

AP/FD MODE STATUS

An AP/FD lateral or vertical mode can be armed, engaged, or disengaged.
An AP/FD common mode can either be engaged or disengaged.
When all APs and FDs disengage, all AP/FD modes disengage.

AP/FD MODE DISPLAY

The FMA displays the AP/FD modes (*Refer to DSC-22_30-80-20 FMA Display*).

Intentionally left blank

General

GENERAL

Ident.: DSC-22_30-40-20-10-00022086.0001001 / 18 MAY 22
Applicable to: ALL

At takeoff, SRS vertical mode, and RWY lateral mode simultaneously engage. They disengage at different moment.
In some cases, when airborne, RWY mode can change to another lateral takeoff mode such as RWY TRK mode.

Intentionally left blank

SRS TO Mode

GENERAL

Ident.: DSC-22_30-40-20-20-00022087.0001001 / 18 MAY 22
Applicable to: ALL

The SRS mode is a managed vertical mode, used during takeoff and during go-around.
This chapter only describes the SRS mode during takeoff, also referred to as the SRS TO mode. The FMA announces the SRS TO mode with the SRS indication.
The SRS TO controls the speed via the elevators, in order to steer the aircraft along a vertical path.

L2 The guidance law also includes:
- A flight path angle protection, that ensures a positive climb slope of 0.5 °
- A pitch angle protection to reduce the aircraft nose-up (17.5 ° of maximum pitch attitude or 22.5 ° maximum in case of windshear)
- A speed protection limiting the target speed to V2+15 kt.

L1 When the aircraft is on ground, V2 is the speed target.
When the aircraft is airborne, V2+10 kt becomes the speed target.
If one engine fails, the speed target is the current aircraft speed at the engine failure detection.
However, the speed target is limited by V2 and V2+15 kt.
For more information on the speed target, *Refer to DSC-22_20-60-40 Flight Guidance Part*.
For more information on the speed target, *Refer to DSC-22_30-60-20 General*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-20-20-00022088.0001001 / 18 MAY 22
Applicable to: ALL

SRS TO engages, when all of the following conditions are applicable:
- The aircraft is on ground
- The slats or the flaps are extended
- V2 is inserted in the PERF TAKEOFF page

L2 If V2 has not been inserted, V/S mode engages 5 s after lift-off on the current V/S value.

L1
- The flight crew sets at least one thrust lever:
  - To the TOGA detent, or
  - To the FLX-MCT detent, when a FLX TO temperature or a Derated Takeoff is entered in the PERF TAKEOFF page.

Note: *When V2 is inserted, or SRS TO is engaged, the speed automatically becomes managed. For more information about engagement conditions of managed speed, Refer to DSC-22_30-60-20 Engagement Conditions.*

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-20-20-A-00022089.0001001 / 04 MAY 23

SRS TO mode disengages, when one of the following occurs:
- Automatically, at the ACCEL ALT, or if ALT* or ALT CST* mode engages (above 400 ft RA), or
- Another vertical mode engages.

Note: *In Engine Out conditions, the SRS mode does not automatically disengage at EO ACCEL ALT.*

Ident.: DSC-22_30-40-20-20-A-00022090.0001001 / 18 MAY 22

REVERSIONS

SRS TO reverts to OP CLB, when the FCU selected altitude is above the aircraft altitude, and the flight crew pulls the SPD/MACH knob.

Ident.: DSC-22_30-40-20-20-A-00024948.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

RWY Mode

GENERAL

Ident.: DSC-22_30-40-20-30-00022102.0001001 / 18 MAY 22
Applicable to: ALL

The RWY mode is a managed lateral mode.
When the LOC signal is available, the RWY mode gives lateral guidance orders during takeoff, and initial climb.

L2 The RWY guidance law aims to maintain the aircraft on the runway centerline during the takeoff run.
When the aircraft is airborne, the RWY guidance law aims to maintain the sideslip indicator centered.
To follow the guidance, the FD displays the conventional guidance bar.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-20-30-00022116.0001001 / 18 MAY 22
Applicable to: ALL

RWY engages, if all of the following conditions are applicable:

L2
- V2 is inserted in the PERF TAKEOFF page, and
- The aircraft is on ground, and
- The slats are extended, and
- The LOC is valid, and
- The LOC deviation is below 1/2 dot, and
- The aircraft heading is within 20 ° of the ILS (GLS ◁) (SLS ◁) course, and
- An ILS (GLS ◁)(SLS ◁) is set, associated to the takeoff runway, and the difference between the LS course and the runway heading, as inserted in the flight plan is less than 2 °, and
- No lateral mode is already engaged, and

L1
- The flight crew sets a thrust lever to:
  - The TOGA detent, if TOGA is selected on the PERF TAKEOFF page, or
  - The FLX-MCT detent, if a FLX TO temperature or a Derated Takeoff ◁ level is entered on the PERF TAKEOFF page.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-20-30-00022126.0001001 / 04 MAY 23
Applicable to: ALL

RWY disengages, when one of the following occurs:
- The LOC is lost below 30 ft RA
- NAV is armed, and the aircraft reaches 30 ft RA: NAV engages

L2
- NAV is not armed, and the aircraft reaches 30 ft RA: RWY TRK engages

L1 - Another lateral mode engages

L2 - The aircraft heading deviates from more than 20 ° from the ILS (GLS ⊲)(SLS ⊲) course.

RWY TRK Mode

GENERAL

Ident.: DSC-22_30-40-20-40-00022129.0001001 / 18 MAY 22
Applicable to: ALL

RWY TRK mode is a managed lateral mode.
The RWY TRK mode guides the aircraft along a constant track target. The track target is the aircraft track at RWY TRK engagement.

L2 To follow the guidance, the FD displays the conventional guidance bar.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-20-40-00022130.0001001 / 18 MAY 22
Applicable to: ALL

The RWY TRK automatically engages at 30 ft RA, if all of the following conditions are applicable:
- The FMS flight phase is takeoff, and
- NAV is not engaged.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-20-40-00022131.0001001 / 04 MAY 23
Applicable to: ALL

RWY TRK disengages, when one of the following occurs:
- The flight crew pulls the HDG/TRK knob: HDG/TRACK engages.
- NAV is armed, and the aircraft reaches the capture zone of the active leg: NAV engages.
- The flight crew inserts a DIRECT TO waypoint: NAV engages.

Intentionally left blank

HDG/TRACK Mode

GENERAL

Ident.: DSC-22_30-40-30-10-00019558.0001001 / 18 MAY 22
Applicable to: ALL

HDG and TRK are selected lateral modes. They are the basic modes of lateral guidance. HDG/TRK guides the aircraft laterally along the heading/track target, that appears in the HDG/TRK window on the FCU. For more information on the HDG/TRK window, *Refer to DSC-22_10-40-20 Lateral Control Area* Window.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-30-10-A-00019559.0001001 / 04 MAY 23

HDG or TRACK engages when one of the following conditions occurs:

Ident.: DSC-22_30-40-30-10-A-00019778.0001001 / 18 MAY 22

- The flight crew pulls the HDG/TRK knob on the FCU in flight, or

L2 This is applicable if:
  - The aircraft is in flight, for at least 5 s after liftoff, or
  - Not in LAND, FLARE, or ROLL OUT, or
  - Not in GA TRK below 100 ft RA.

Ident.: DSC-22_30-40-30-10-A-00019779.0001001 / 18 MAY 22

- NAV is engaged and the flight crew inserts a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT, or

Ident.: DSC-22_30-40-30-10-A-00019785.0001001 / 04 MAY 23

- FINAL mode (armed or engaged) is lost when the aircraft is in APP NAV mode, or

Ident.: DSC-22_30-40-30-10-A-00019786.0001001 / 04 MAY 23

- All AP and FDs were previously off, and the flight crew engages the AP or the FDs

  Note: *1. The AP or FDs engage in basic modes: HDG or TRACK, and V/S or FPA.*
  2. If the FD engages, the FD bars flash for 10 s.

Ident.: DSC-22_30-40-30-10-A-00019787.0001001 / 18 MAY 22

- LOC mode is armed when FINAL APP was previously engaged, or

Ident.: DSC-22_30-40-30-10-A-00019790.0001001 / 04 MAY 23

- The flight crew presses the APPR pb (above 400 ft RA) or the LOC pb to off, when the approach is armed, or

Ident.: DSC-22_30-40-30-10-A-00019792.0001001 / 18 MAY 22

- LOC*, LOC, LOC B/C*, LOC B/C, F-LOC* ◁ or F-LOC ◁ is engaged in a LOC only approach, and the flight crew presses the LOC pb to off.

Ident.: DSC-22_30-40-30-10-A-00020294.0001001 / 04 MAY 23

REVERSIONS TO HDG/TRK

The HDG/TRACK also engages when one of the following reversion occurs:

- NAV disengages:
  - The aircraft reaches a flight plan discontinuity
  - The NAV mode fails.
- The approach is modified in the flight plan, when LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C*, or LOC B/C is engaged
- LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C*, or LOC B/C is lost after a failure occurs in approach.
  All AP(s) disengage. The FDs reverts to HDG or TRACK and V/S or FPA.

Note: *If a managed vertical mode was previously engaged, a selected vertical mode engages:*
- *If CLB was engaged, OP CLB engages*
- *If ALT CST*, ALT CRZ*, or DES was engaged, V/S / FPA engages*
- *If ALT CST was engaged, ALT engages.*

Ident.: DSC-22_30-40-30-10-A-00022000.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10s
- The FD bars flash for 10s.

HDG-V/S / TRK-FPA SELECTION

Ident.: DSC-22_30-40-30-10-00022905.0001001 / 04 MAY 23
Applicable to: ALL

The flight crew can press the HDG-V/S / TRK-FPA pb on the FCU to change from one selection to another.
At the aircraft power-up, the HDG-V/S / TRK-FPA selection is set to HDG-V/S by default.

When HDG-V/S is selected:
- HDG appears on the HDG/TRK window of the FCU
- V/S appears on the V/S / FPA window of the FCU
- HDG and/or V/S mode(s) can be engaged
- TRACK and FPA modes cannot be engaged

When TRK-FPA is selected:
- TRK appears on the HDG/TRK window of the FCU
- FPA appears on the V/S / FPA window of the FCU
- HDG and V/S mode(s) cannot be engaged
- TRACK and/or FPA modes can be engaged
- Both PFDs display the FPV in green.

HDG/TRK PRESET

Ident.: DSC-22_30-40-30-10-B-00024993.0001001 / 04 MAY 23
Applicable to: ALL

GENERAL

The system has a HDG/TRK preset function for takeoff and go-around.
If the flight crew decides not to fly the flight plan after takeoff or go-around, the flight crew can turn the HDG/TRK knob on the FCU to preset a heading or a track. The set value remains displayed in the FCU HDG/TRK window until the flight crew pulls the knob.

AT TAKEOFF

If the flight crew presets the HDG/TRK before takeoff and up to 30 ft RA, NAV disarms. The preset value remains displayed in the HDG/TRK window (even when RWY TRK engages at 30 ft RA)
When the flight crew pulls the HDG/TRK knob (at least 5 s after liftoff), HDG or TRACK mode engages.
The aircraft follows the preset target.

Ident.: DSC-22_30-40-30-10-B-00019562.0002001 / 04 MAY 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

AT GO-AROUND

If the flight crew presets the HDG/TRK when LOC*, LOC, LOC B/C, LOC B/C*, F-LOC* ◁ , F-LOC ◁ , LAND, FLARE, ROLL OUT or GA TRK mode is engaged, the preset value remains displayed in the HDG/TRK window, as long as one of theses modes is engaged.
After go-around engagement, HDG/TRACK will engage, when the flight crew pulls the HDG/TRK knob.
When the HDG or TRACK engages, the heading/track target is the HDG/TRK preset.

Ident.: DSC-22_30-40-30-10-B-00019562.0001001 / 04 MAY 23
Applicable to: LV-GKO, LV-GKP

AT GO-AROUND

If the flight crew presets the HDG/TRK when LOC*, LOC, LOC B/C, LOC B/C*, F-LOC* ◁ , F-LOC ◁ , LAND, FINAL APP, FLARE, ROLL OUT or GA TRK mode is engaged, the preset value remains displayed in the HDG/TRK window, as long as one of theses modes is engaged.
After go-around engagement, HDG/TRACK will engage, when the flight crew pulls the HDG/TRK knob.
When the HDG or TRACK engages, the heading/track target is the HDG/TRK preset.

Ident.: DSC-22_30-40-30-10-B-00025795.0001001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

When overflying the MAP, HDG/TRK will synchronize with the current aircraft heading / track. The HDG/TRK preset function is no longer available.

Ident.: DSC-22_30-40-30-10-B-00024994.0001001 / 18 MAY 22
Applicable to: ALL

CANCELLATION

The flight crew can cancel a HDG/TRK preset with one of the following action:
- The HDG/TRK knob is pushed, or
- A DIR TO is selected in the FMS, or
- The AP and FDs are disengaged.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-30-10-00019382.0001001 / 04 MAY 23
Applicable to: ALL

The engagement of any other lateral mode disengages HDG or TRACK.

SYNCHRONIZE THE HDG/TRK WINDOW OF THE FCU

Ident.: DSC-22_30-40-30-10-00019396.0001001 / 04 MAY 23
Applicable to: ALL

The lateral window of the FCU displays heading or a track value when:
- The HDG/TRACK mode is engaged. The displayed value is the current HDG/TRK or the manually selected value of the target
- The flight crew turns the HDG/TRK knob. The value in the window first synchronizes with the current HDG/TRK, then displays the manual selection. It remains displayed for 45 s, then vanishes if the flight crew does not pull the knob (except in HDG preset)

- A HDG/TRK is preset
- AP/FD is lost. The value becomes that of the aircraft current heading or track.

Note: *If HDG is switched to TRK (or vice versa), the value displayed in the window switches from heading to track (or vice versa).*

Intentionally left blank

NAV Mode

GENERAL

Ident.: DSC-22_30-40-30-20-00019634.0001001 / 18 MAY 22
Applicable to: ALL

The NAV mode is a managed lateral mode, that guides the aircraft laterally along the FMS flight plan. It is designed to have a zero crosstrack error. NAV usually arms before engaging.

ARMING CONDITIONS

Ident.: DSC-22_30-40-30-20-00019643.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP

For NAV arming, the lateral flight plan must be available.

NAV arms, when one of the following occurs:
- The aircraft is on ground, and the flight crew does not preset a HDG/TRK for takeoff, or
- The flight crew pushes the HDG/TRK knob on the FCU, or
- The flight crew activates a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT when in HDG or TRK mode, or
- The flight crew presses the APPR pb and the conditions to arm the FINAL APP mode are applicable.

However, NAV cannot arm, if one of the following modes is engaged: LOC*, LOC, F-LOC* , F-LOC , LOC B/C*, LOC B/C, LAND, FLARE, ROLL OUT.

ARMING CONDITIONS

Ident.: DSC-22_30-40-30-20-00019643.0004001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

For NAV arming, the lateral flight plan must be available.

NAV arms, when one of the following occurs:
- The aircraft is on ground, and the flight crew does not preset a HDG/TRK for takeoff, or
- The flight crew pushes the HDG/TRK knob on the FCU, or
- The flight crew activates a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT when in HDG/TRK mode, or
- The flight crew presses the APPR pb and the conditions to arm the FINAL APP mode are applicable, or
- The flight crew initiates a go-around.

L2 This is not applicable if HDG/ TRK is preset.

L1 However, NAV cannot arm, if one of the following modes is engaged: LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C*, LOC B/C, LAND, FLARE, ROLL OUT.

DISARMING CONDITIONS

Ident.: DSC-22_30-40-30-20-00019645.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP

NAV mode disarms, when one of the following occurs:
- The flight crew presets a HDG/TRK for takeoff, or go-around, or
- NAV mode engages, or
- The flight crew pulls out the HDG/TRK knob, or
- The flight crew arms or engages an approach mode, except if the APP NAV can be armed, or
- The flight crew engages a go-around, or
- LAND mode engages.

DISARMING CONDITIONS

Ident.: DSC-22_30-40-30-20-00019645.0003001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

NAV mode disarms, when one of the following occurs:
- The flight crew presets a HDG/TRK for takeoff, or go-around, or
- NAV mode engages, or
- The flight crew pulls out the HDG/TRK knob, or
- The flight crew arms or engages an approach mode, except if the APP NAV can be armed, or
- LAND mode engages.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-30-20-00019646.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP

For NAV engagement, the lateral flight plan must be available.

NAV engages, if one of the following occurs:
- NAV is armed, and the aircraft reaches 30 ft RA after takeoff, or
- NAV is armed, and the aircraft reaches the capture zone of the flight plan active leg, or
- The flight crew activates a DIR TO on the MCDU, or

L2 This is not applicable, if LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C*, LOC B/C, LAND, FLARE, ROLL OUT is engaged below 700 ft RA.

L1
- The flight crew selects the HDG/TRK when the aircraft is close to (within ~1 NM of) the active flight plan leg.

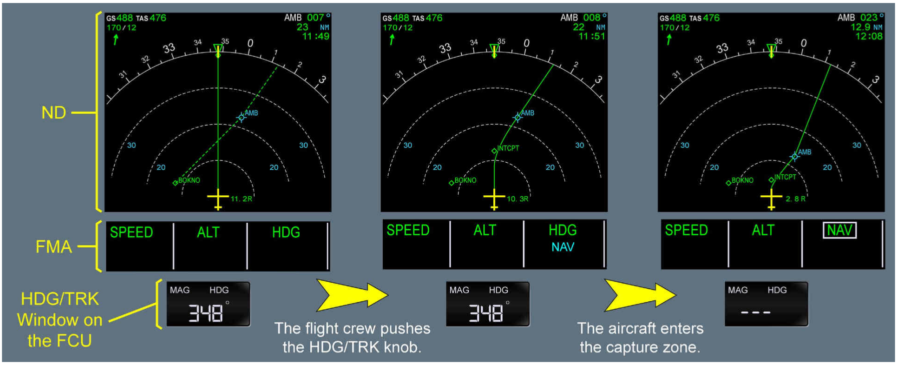
When NAV is engaged, the HDG/TRK window on the FCU displays dashes.

CAPTURE ZONE OF THE FLIGHT PLAN ACTIVE LEG

When NAV is armed, it automatically engages, if:

- The aircraft track line intercepts the flight plan between the FROM and the TO waypoints, and
- The intercept waypoint (INTCPT) is displayed on the ND, and
- The aircraft reaches the capture zone of the flight plan active leg.

The following is an example:



The flight crew pushes the HDG/TRK knob.

The aircraft enters the capture zone.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-30-20-00019646.0003001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

For NAV engagement, the lateral flight plan must be available.

NAV engages, if one of the following occurs:

- NAV is armed, and the aircraft reaches 30 ft RA after takeoff, or
- NAV is armed, and the aircraft reaches the capture zone of the flight plan active leg, or
- The flight crew activates a DIR TO on the MCDU, or

L2 This is not applicable, if LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C*, LOC B/C, LAND, FLARE, ROLL OUT is engaged below 700 ft RA.

L1
- The flight crew selects the HDG/TRK when the aircraft is close to (within ~1 NM of) the active flight plan leg, or
- The flight crew initiates a go-around above 100 ft RA, and the aircraft reaches the capture zone of the flight plan active leg.

L2 This is not applicable if a HDG/TRK was preset.

L1 When NAV is engaged, the HDG/TRK window on the FCU displays dashes.

CAPTURE ZONE OF THE FLIGHT PLAN ACTIVE LEG

When NAV is armed, it automatically engages, if:

- The aircraft track line intercepts the flight plan between the FROM and the TO waypoints, and
- The intercept waypoint (INTCPT) is displayed on the ND, and
- The aircraft reaches the capture zone of the flight plan active leg.

The following is an example:

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-30-20-A-00019647.0004001 / 04 MAY 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

NAV disengages, when HDG, TRACK, LOC *, F-LOC * ◁ , LOC B/C *, or GA TRK engages.

REVERSIONS

NAV disengages, and reverts to the HDG/TRACK mode when:

- The aircraft reaches a flight plan discontinuity
- The flight plan becomes invalid.

Note: *When the lateral mode reverts to HDG/TRACK, the vertical mode also reverts to a vertical selected mode.*

For more information about the reversion to HDG/TRACK, *Refer to DSC-22_30-40-30-10 Engagement Conditions 1*

Ident.: DSC-22_30-40-30-20-A-00019647.0001001 / 04 MAY 23
Applicable to: LV-GKO, LV-GKP

NAV disengages, when one of the following conditions is applicable:
- HDG, TRACK, LOC *, F-LOC * ◁ , LOC B/C *, or GA TRK engages, or
- if at MDA-50, APP NAV mode engages.

REVERSIONS

NAV disengages, and reverts to the HDG/TRACK mode when:
- The aircraft reaches a flight plan discontinuity
- The flight plan becomes invalid.

Note: *When the lateral mode reverts to HDG/TRACK, the vertical mode also reverts to a vertical selected mode.*

For more information about the reversion to HDG/TRACK, *Refer to DSC-22_30-40-30-10 Engagement Conditions 1*.

Ident.: DSC-22_30-40-30-20-A-00019793.0001001 / 18 MAY 22
Applicable to: ALL

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10s
- The FD bars flash for 10s.

INTERACTIONS WITH VERTICAL MODES

Ident.: DSC-22_30-40-30-20-00019648.0001001 / 18 MAY 22
Applicable to: ALL

When NAV is engaged with the managed vertical modes CLB or DES or FINAL APP, the guidance takes into account the altitude and speed constraints, linked to waypoints on the lateral flight plan. When NAV disengages, the managed vertical modes are not available and the altitude constraints are disregarded.

Intentionally left blank

OP CLB Mode

GENERAL

Ident.: DSC-22_30-40-40-10-00022133.0001001 / 18 MAY 22
Applicable to: ALL

OP CLB mode is a selected vertical mode.
OP CLB guides the aircraft vertically to the FCU selected altitude. All altitude constraints are disregarded.

When OP CLB is engaged:
- OP CLB controls the speed/Mach target (selected or managed)
- If the A/THR is active, the A/THR will control the thrust.

OP CLB usually arms before it engages.

ARMING CONDITIONS

Ident.: DSC-22_30-40-40-10-00022134.0001001 / 18 MAY 22
Applicable to: ALL

OP CLB arms, when all of the following conditions are applicable:
- The aircraft is on ground, or SRS is engaged (TO or GA), and
- NAV is neither armed nor engaged, or the vertical flight plan is not available, and
- The ACCEL altitude is available and below the FCU selected altitude.

DISARMING CONDITIONS

Ident.: DSC-22_30-40-40-10-00022135.0001001 / 18 MAY 22
Applicable to: ALL

OP CLB disarms, when one of the following occurs:
- V/S / FPA or OP CLB engages, or
- The ACCEL altitude becomes equal to, or above the FCU selected altitude, or
- CLB arms.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-40-10-A-00022136.0001001 / 18 MAY 22

L2 The OP CLB mode can only engage, when all of the following are applicable:
- LAND or FLARE is not engaged, and
- If SRS GA is engaged, the aircraft is above 100 ft RA, and
- The aircraft is airborne for at least 5 s.

L1 OP CLB mode engages, when one of the following are applicable:
- The FCU selected altitude is above the aircraft altitude, and the flight crew pulls the ALT knob, or
- SRS TO or SRS GA is engaged with OP CLB armed, and the aircraft reaches the ACCEL altitude.

Ident.: DSC-22_30-40-40-10-A-00022138.0001001 / 18 MAY 22

REVERSIONS TO OP CLB

OP CLB also engages, when one of the following reversions occurs:
- CLB and NAV are engaged, and NAV disengages, or
- L2 CLB is engaged, and the vertical flight plan becomes invalid, or
- CLB is engaged, and the FMS flight phase changes to the descent or approach phase, or
- L1 SRS TO, or SRS GA is engaged, the FCU selected altitude is above the aircraft altitude, and the flight crew pulls the SPD/MACH knob.

Ident.: DSC-22_30-40-40-10-A-00022142.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

OP CLB ASSOCIATION WITH ALTITUDE MODES

Ident.: DSC-22_30-40-40-10-00022137.0001001 / 18 MAY 22
Applicable to: ALL

OP CLB ASSOCIATION WITH ALTITUDE MODES

OP CLB is always associated to an altitude mode.
When OP CLB is engaged:

Conditions	The FMA displays the following message on Line 2 of the "AP/FD Verticl Modes" column:
The next altitude target is the FCU selected altitude. In addition, the FCU selected altitude is not set to the cruise altitude.	ALT is armed
The next altitude target is the cruise altitude. In this case, the FCU selected altitude is equal to the cruise altitude. *Note:* *The cruise altitude is defined on the PROG page.*	ALT CRZ is armed

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-40-10-B-00022143.0001001 / 18 MAY 22

OP CLB disengages, when another vertical mode engages.

L2 OP CLB disengages, when one of the following occurs:
- ALT is armed, and the aircraft reaches the capture zone of the FCU selected altitude: ALT * engages
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude: ALT CRZ* engages.
- The flight crew pushes the ALT knob, when:
  - NAV is engaged
  - The vertical flight plan is available
  - The FMS flight phase is neither the descent, nor the approach phase.

  CLB engages
- The flight crew pulls or pushes the V/S / FPA knob to engage V/S / FPA
- The flight crew pushes the ALT pb to engage ALT.

Ident.: DSC-22_30-40-40-10-B-00022149.0001001 / 18 MAY 22

REVERSIONS

OP CLB reverts to V/S / FPA, when the flight crew sets the FCU selected altitude below the aircraft altitude.

Ident.: DSC-22_30-40-40-10-B-00022150.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

CLB Mode

GENERAL

Ident.: DSC-22_30-40-40-20-00022171.0001001 / 18 MAY 22
Applicable to: ALL

CLB mode is a managed vertical mode.
CLB guides the aircraft vertically along the FMS flight plan, to the FCU selected altitude or to the next altitude constraint, whichever comes first. Therefore, altitude constraints, associated with applicable waypoints, are taken into account.
CLB can only be engaged, when NAV is engaged.

When CLB is engaged:
- AP/FDs controls the speed/Mach target (selected or managed) through the elevators

  Note: The FG system does not adjust the speed/Mach target to match the altitude constraints.

- If the A/THR is active, the A/THR will control the thrust.

CLB usually arms before it engages.

ARMING CONDITIONS

Ident.: DSC-22_30-40-40-20-00022172.0001001 / 18 MAY 22
Applicable to: ALL

CLB arms, when all of the following conditions are applicable:
- The aircraft is on ground, or SRS TO or SRS GA is engaged, and
- NAV is armed or engaged, or the vertical flight plan is available, and
- L2 The altitude set on the FCU is above the current altitude, and
- L1 The ACCEL altitude is available, and is below:
  - the FCU selected altitude, and
  - the next altitude constraint.

L2 CLB also arms, when CLB was previously engaged, and ALT CST* engages. This scenario is possible, when the selected altitude set on the FCU is above the altitude constraint.
L1 The flight crew can display and modify the ACCEL altitude on the PERF TAKEOFF and PERF GO AROUND pages.

DISARMING CONDITIONS

Ident.: DSC-22_30-40-40-20-00022173.0001001 / 18 MAY 22
Applicable to: ALL

CLB disarms, when one of the following occurs:
- Another vertical mode engages, or
- NAV disarms, or NAV disengages, or
- L2 The flight crew sets the FCU target altitude at or below the altitude constraint, when ALT CST* or ALT CST is engaged, or
- The ACCEL altitude becomes equal to, or above the subsequent target altitude, when the aircraft is on ground, or when SRS TO or SRS GA is engaged, or
- L1 The FCU selected altitude is set to be below the aircraft altitude, or
- The FMS flight phase changes to DES or APPR phase.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-40-20-00020336.0001001 / 18 MAY 22
Applicable to: ALL

CLB engages, when all of the following are applicable:
- NAV is engaged, and
- The FMS flight phase is neither DES, APPR, nor go-around phase, and
- The vertical flight plan is valid, and
- The aircraft is airborne for at least 5 s.

CLB mode engages, when one of the following is applicable:
- SRS TO or SRS GA is engaged with CLB armed, and the aircraft reaches the ACCEL altitude, or
- ALT CST is engaged with CLB armed, and the aircraft sequences the altitude constraint, or
- The FCU selected altitude is set to be above the aircraft altitude, and the flight crew pushes the ALT knob.
  This scenario is applicable if CLB is not yet armed.

  Note: *If the aircraft altitude is within the capture zone of the FCU selected altitude, CLB will immediately disengage, and ALT* will engage.*

CLB ASSOCIATION WITH ALTITUDE MODES

Ident.: DSC-22_30-40-40-20-00022132.0001001 / 04 MAY 23
Applicable to: ALL

CLB is always associated to an altitude mode.
When CLB is engaged:

Conditions	The FMA displays the following message on Line 2 of the "AP/FD Vertical Modes" column:
The next altitude target is the FCU selected altitude. In addition, the FCU selected altitude is not set to the cruise altitude. However, the FCU selected altitude can be equal to an altitude constraint.	ALT is armed
The next altitude target is an altitude constraint, and the FCU selected altitude is above the altitude constraint.	ALT CST is armed
The next altitude target is the cruise altitude. In this case, the FCU selected altitude is equal to the cruise altitude. *Note:* *The cruise altitude is defined in the FMS PROG page.*	ALT CRZ is armed

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-40-20-A-00022551.0001001 / 18 MAY 22

CLB disengages, when another vertical mode engages.

Ident.: DSC-22_30-40-40-20-A-00022552.0001001 / 04 MAY 23

REVERSIONS

CLB also disengages, when one of the following reversions occurs:

- NAV disengages when:
  - The aircraft reaches a flight plan discontinuity, or
  - The next altitude target is an altitude constraint, and the flight crew engaged the HDG/TRACK mode.

  OP CLB engages
- The flight crew sets the FCU selected altitude below the aircraft altitude: V/S / FPA engages
- The vertical flight plan becomes invalid: OP CLB engages
- The FMS flight phase changes to DES or APPR phase: OP CLB engages.

Ident.: DSC-22_30-40-40-20-A-00022553.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

ALT

GENERAL

Ident.: DSC-22_30-40-50-10-A-00025247.0001001 / 18 MAY 22
Applicable to: ALL

ALT* mode guides the aircraft to acquire the selected FCU altitude.
ALT mode maintains the selected FCU altitude.

The ALT* mode:
- Has an internal V/S guidance that is a direct function of the difference between present altitude and the altitude target
- Has an internal protection that decreases the vertical speed when VLS or VMAX is reached. (VLS or VMAX becomes the priority target)

Ident.: DSC-22_30-40-50-10-A-00025797.0002001 / 18 MAY 22
Applicable to: LV-GHQ, LV-GIF

- In the case of TA, in order to avoid spurious RA, automatically adjusts the V/S to reach the target altitude

Ident.: DSC-22_30-40-50-10-A-00025798.0001001 / 18 MAY 22
Applicable to: ALL

The system switches automatically to ALT mode when the altitude deviation becomes less than 40 ft.

Note: *If the baro setting is changed during ALT* mode, this may lead to an FCU target overshoot due to the change of the current value of the altitude. However ALT* mode will enable the FCU altitude to be regained.*

ALT ARMING CONDITIONS

Ident.: DSC-22_30-40-50-10-00025248.0001001 / 04 MAY 23
Applicable to: ALL

ALT arms, with FD/AP engaged, when the aircraft climbs or descends toward the FCU selected altitude.
However, ALT does not arm, when one of the following modes is engaged: G/S*, G/S, F-G/S* ◁ , F-G/S ◁ , FINAL APP, LAND, FLARE, ROLL OUT.

L2 ALT arms, if one of the following conditions occurs:
- The flight crew changes the altitude target on the FCU, or
- The flight crew changes the barometric reference (QNH, QFE, or STD) on the EFIS CP, or
- The AP/FD TCAS ◁ mode engages, or
- The difference between the aircraft altitude and the altitude set on the FCU is more than 250 ft.

L1 ALT arms, when one of the following occurs:
- OP CLB engages, and the FCU selected altitude is not set to the cruise altitude, or
- OP DES engages, or
- CLB engages, when the next altitude target is:
  - Equal to the FCU selected altitude
  - Not equal to the cruise altitude.
- DES engages, and the next altitude target is the FCU selected altitude, or
- V/S / FPA engages, and the next altitude target is the FCU selected altitude, or
- SRS TO or SRS GA engages, and the altitude target set on the FCU is above the current aircraft altitude.

ALT DISARMING CONDITIONS

Ident.: DSC-22_30-40-50-10-00025249.0001001 / 18 MAY 22
Applicable to: ALL

ALT disarms when one of the following occurs:
- ALT* engages, or
- G/S*, F-G/S* ◁ , or FINAL APP engages, or
- ALT CST arms.

ALT* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-10-00025250.0001001 / 18 MAY 22
Applicable to: ALL

ALT* engages, when ALT is armed, and the aircraft reaches the capture zone of the altitude target.
L2 ALT* engagement is inhibited during 3 s after the selected alititude is changed on the FCU.

ALT* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-50-10-B-00025254.0001001 / 18 MAY 22

ALT* disengages when another vertical mode engages.

Ident.: DSC-22_30-40-50-10-B-00025265.0001001 / 18 MAY 22

REVERSIONS

ALT* reverts to V/S / FPA when the flight crew changes the FCU selected altitude by more than 250 ft.

Ident.: DSC-22_30-40-50-10-B-00025266.0001001 / 18 MAY 22

If within 5 s after reversion to V/S / FPA, to confirm the altitude target change, the flight crew does not:

- Pull the ALT knob, or
- Set a new V/S / FPA target, or
- Push the ALT pb on the FCU.

Then:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

ALT ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-10-00025255.0001001 / 18 MAY 22
Applicable to: ALL

ALT engages, when ALT* is engaged, and the aircraft reaches the altitude target.
L2 The aircraft is at the altitude target when the difference between the aircraft altitude and the altitude target is less than 40 ft for more than two seconds.

ALT engages, when one of the following occurs:

- The flight crew presses the ALT pb, or
- ALT CST is engaged, and the flight crew sets the FCU selected altitude to the altitude constraint, or
- ALT CST is engaged, and NAV disengages.

ALT DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-50-10-C-00025256.0001001 / 18 MAY 22

ALT disengages, when any other vertical mode engages.

Ident.: DSC-22_30-40-50-10-C-00025267.0001001 / 18 MAY 22

MANUAL DISENGAGEMENT

ALT manually disengages, when one of the following occurs:

- The flight crew pulls the ALT knob: OP CLB or OP DES engages
- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The FCU selected altitude is above the aircraft altitude
  - NAV is engaged
  - The FMS flight phase is neither descent, nor approach.

  CLB engages
- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The FCU selected altitude is below the aircraft altitude
  - One of the following mode is engaged : NAV, LOC *, LOC, LOC B/C*, LOC B/C
  - The FMS flight phase is not one of the following: takeoff, climb, go-around.

  DES engages
- L2 The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The aircraft altitude is equal to the altitude constraint
  - The FCU selected altitude is set above the aircraft altitude

    The FCU selected altitude is at least 250 ft above the aircraft altitude
  - NAV is engaged
  - The FMS flight phase is neither descent, nor approach.

  ALT CST engages
- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The aircraft altitude is equal to the altitude constraint
  - The FCU selected altitude is set below the aircraft altitude

    The FCU selected altitude is at least 250 ft below the aircraft altitude
  - One of the following mode is engaged : NAV, LOC *, LOC, LOC B/C*, LOC B/C
  - The FMS flight phase is not one of the following: takeoff, climb, go-around.

  ALT CST engages
- The aircraft altitude is equal to the FCU selected altitude, and the flight crew sets the cruise altitude to the aircraft altitude: ALT CRZ engages
- L1 The flight crew pulls or pushes the V/S / FPA knob: V/S / FPA engages
- The flight crew engages go-around: SRS GA engages.

Ident.: DSC-22_30-40-50-10-C-00025301.0001001 / 18 MAY 22

AUTOMATIC DISENGAGEMENT

ALT automatically disengages, when one of the following occurs:

Ident.: DSC-22_30-40-50-10-C-00025156.0001001 / 18 MAY 22

- The aircraft reaches the G/S capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed

  G/S* engages

Ident.: DSC-22_30-40-50-10-C-00025157.0001001 / 18 MAY 22

- The aircraft reaches the F-G/S ◁ capture zone when:
  - LOC*, LOC, F-LOC ◁ * or F-LOC ◁ is engaged, and
  - F-G/S ◁ is armed.

  F-G/S* ◁ engages

Ident.: DSC-22_30-40-50-10-C-00025158.0001001 / 18 MAY 22

- The aircraft reaches the FINAL capture zone, when:
  - APP NAV is engaged
  - FINAL is armed

  FINAL APP engages.

Intentionally left blank

ALT CST

GENERAL

Ident.: DSC-22_30-40-50-20-A-00025260.0001001 / 18 MAY 22
Applicable to: ALL

ALT CST* guides the aircraft to acquire an altitude constraint.
ALT CST maintains the altitude constraint delivered by the FMS.

The ALT CST* mode:

- Has an internal V/S guidance that is a direct function of the difference between present altitude and the altitude target
- Has an internal protection that decreases the vertical speed when VLS or VMAX is reached. (VLS or VMAX becomes the priority target)

Ident.: DSC-22_30-40-50-20-A-00025799.0002001 / 18 MAY 22
Applicable to: LV-GHQ, LV-GIF

- In the case of TA, in order to avoid spurious RA, automatically adjusts the V/S to reach the target altitude

Ident.: DSC-22_30-40-50-20-A-00025800.0001001 / 18 MAY 22
Applicable to: ALL

The system switches automatically to ALT CST mode when the altitude deviation becomes less than 40 ft.

Note: *For aircraft equipped with QFE option, a switching from STD to QFE (or QFE to STD) in ALT CST* mode, will change the target value and a reversion to V/S may occur if the target value is modified by 250 ft or more.*

ALT CST ARMING CONDITIONS

Ident.: DSC-22_30-40-50-20-00025262.0001001 / 18 MAY 22
Applicable to: ALL

ALT CST arms, with FD/AP engaged, when the aircraft climbs or descends toward an altitude constraint delivered by the FMS.
However, ALT CST does not arm, when one of the following mode is engaged: G/S*, G/S, F-G/S* ◁*, F-G/S ◁*, FINAL APP, LAND, FLARE, ROLL OUT.

L2 ALT CST arms, if one of the following condition occurs:

- The flight crew changes the barometric reference (QNH, QFE, or STD) on the EFIS CP, or
- The AP/FD TCAS ◁✳ mode engages, or
- The difference between the aircraft altitude and the altitude constraint delivered by the FMS is more than 250 ft.

L1 ALT CST arms, when CLB (DES) engages, and:

- The next altitude target is an altitude constraint delivered by the FMS, and
- The FCU selected altitude is above (below) the altitude constraint.

ALT CST DISARMING CONDITIONS

Ident.: DSC-22_30-40-50-20-00025263.0001001 / 18 MAY 22
Applicable to: ALL

ALT CST disarms when one of the following occurs:

- ALT CST* engages, or
- G/S*, F-G/S* ◁✳ , or FINAL APP engages, or
- CLB is engaged, and one of the following occurs:
  - The FCU selected altitude becomes the next altitude target, or
  - OP CLB or V/S / FPA engages.
- DES is engaged, and one of the following occurs:
  - The FCU selected altitude becomes the next altitude target, or
  - OP DES or V/S / FPA engages, or
  - SRS GA engages.

ALT CST* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-20-00025271.0001001 / 18 MAY 22
Applicable to: ALL

ALT CST* engages, when ALT CST is armed, and the aircraft reaches the capture zone of the altitude target.

L2 ALT CST* engagement is inhibited during 3 s after the selected altitude is changed on the FCU.

ALT CST* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-50-20-B-00025272.0001001 / 18 MAY 22

ALT CST* disengages when another vertical mode engages.

Ident.: DSC-22_30-40-50-20-B-00025274.0001001 / 18 MAY 22

REVERSIONS

ALT CST* reverts to V/S / FPA if NAV disengages.

Ident.: DSC-22_30-40-50-20-B-00025275.0001001 / 18 MAY 22

If within 5 s after reversion to V/S / FPA, to confirm the altitude target change, the flight crew does not:
- Pull the ALT knob, or
- Set a new V/S / FPA target, or
- Push the ALT pb on the FCU.

Then:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

ALT CST ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-20-00025276.0001001 / 18 MAY 22
Applicable to: ALL

ALT CST engages, when ALT CST* is engaged, and the aircraft reaches the altitude target.

L2 ALT CST engages, when one of the following occurs:
- The flight crew pushes the ALT knob, and all the following conditions are applicable:
  - ALT is engaged, and
  - The aircraft altitude is equal to the altitude constraint, and
  - The FCU selected altitude is set above the aircraft altitude
    The FCU selected altitude is at least 250 ft above the aircraft altitude
  - NAV is engaged, and
  - The FMS flight phase is neither descent, nor approach, and
  - The vertical flight plan is valid.

  CLB arms, or
- The flight crew pushes the ALT knob, and all the following conditions are applicable:
  - ALT is engaged, and
  - The aircraft altitude is equal to the altitude constraint, and
  - The FCU selected altitude is set below the aircraft altitude, and
    The FCU selected altitude is at least 250 ft below the aircraft altitude
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC B/C*, LOC B/C, F-LOC*, F-LOC and
  - The FMS flight phase is not one of the following: takeoff, climb, go-around.

  DES arms.

ALT CST DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-50-20-C-00025277.0001001 / 18 MAY 22

ALT CST disengages, when any other vertical modes engages.

Ident.: DSC-22_30-40-50-20-C-00025273.0001001 / 18 MAY 22

MANUAL DISENGAGEMENT

ALT CST manually disengages, when one of the following occurs:
- The flight crew pulls the ALT knob: OP CLB or OP DES engages
- The flight crew pulls or pushes the V/S / FPA knob: V/S / FPA engages
- The flight crew sets the altitude target on the FCU to the altitude constraint: ALT engages
- The flight crew removes the altitude constraint: CLB or DES engages
- The flight crew engages go-around: SRS GA engages.

Ident.: DSC-22_30-40-50-20-C-00025302.0001001 / 18 MAY 22

AUTOMATIC DISENGAGEMENT

ALT CST automatically disengages, when one of the following occurs:
- The aircraft sequences the waypoint, for which the altitude constraint is associated
- NAV disengages: ALT engages

Ident.: DSC-22_30-40-50-20-C-00025182.0001001 / 18 MAY 22

- The aircraft reaches the G/S capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed

  G/S* engages

Ident.: DSC-22_30-40-50-20-C-00025184.0001001 / 18 MAY 22

- The aircraft reaches the F-G/S ◁✻ capture zone when:
  - LOC*, LOC, F-LOC ◁✻ * or F-LOC ◁✻ is engaged, and
  - F-G/S ◁✻ is armed.

  F-G/S* ◁✻ engages

Ident.: DSC-22_30-40-50-20-C-00025185.0001001 / 18 MAY 22

- The aircraft reaches the FINAL capture zone, when:
  - APP NAV is engaged
  - FINAL is armed

  FINAL APP engages.

Intentionally left blank

ALT CRZ

GENERAL

Ident.: DSC-22_30-40-50-30-A-00025278.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ* mode guides the aircraft to acquire the cruise altitude, as selected on the FMS PROG page and on the FCU.
ALT CRZ mode maintains the cruise altitude, as selected on the FMS PROG page and on the FCU.

The ALT CRZ* mode:
- Has an internal V/S guidance that is a direct function of the difference between present altitude and the altitude target
- Has an internal protection that decreases the vertical speed when VLS or VMAX is reached. (VLS or VMAX becomes the priority target)

Ident.: DSC-22_30-40-50-30-A-00025801.0002001 / 18 MAY 22
Applicable to: LV-GHQ, LV-GIF

- In the case of TA, in order to avoid spurious RA, automatically adjusts the V/S to reach the target altitude

Ident.: DSC-22_30-40-50-30-A-00025802.0001001 / 18 MAY 22
Applicable to: ALL

The system switches automatically to ALT CRZ mode when the altitude deviation becomes less than 40 ft. Once ALT CRZ engages, the A/THR SOFT mode activates (*Refer to DSC-22_30-50-50 A/THR SOFT Mode*).

Note: *If the baro setting is changed during ALT CRZ * mode, this may lead to an FCU target overshoot due to the change of the current value of the altitude. However ALT CRZ * mode will enable the FCU altitude to be regained.*

ALT CRZ ARMING CONDITIONS

Ident.: DSC-22_30-40-50-30-00025279.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ arms, with FD/AP engaged, when the aircraft climbs or descends toward the cruise altitude, as selected on the FMS PROG page and on the FCU.
However, ALT CRZ does not arm, when one of the following modes is engaged: G/S*, G/S, F-G/S* ◁ , F-G/S ◁ , FINAL APP, LAND, FLARE or ROLL OUT.

ALT CRZ arms, if one of the following condition occurs:
- The flight crew changes the altitude target on the FCU to the cruise altitude, as selected on the FMS PROG page, or
- ALT CRZ is engaged and the flight crew changes the altitude target on the FCU, or
- The flight crew changes the barometric reference (QNH, QFE, or STD) on the EFIS CP, or
- The AP/FD TCAS ◁ mode engages.

ALT CRZ DISARMING CONDITIONS

Ident.: DSC-22_30-40-50-30-00025280.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ disarms when one of the following occurs:
- ALT CRZ* engages, or
- The altitude target on the FCU is set below the cruise altitude: ALT arms.

ALT CRZ* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-30-00025281.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ* engages, when one of the following occurs:
- ALT CRZ is armed, and the aircraft reaches the capture zone of the altitude target, or
- ALT CRZ is engaged and the flight crew selects another FCU target altitude within the capture zone.

ALT CRZ* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-50-30-B-00025282.0001001 / 18 MAY 22

ALT CRZ* disengages when another vertical mode engages.

Ident.: DSC-22_30-40-50-30-B-00025286.0001001 / 18 MAY 22

REVERSIONS

ALT CRZ* reverts to V/S / FPA if NAV disengages.

Ident.: DSC-22_30-40-50-30-B-00025287.0001001 / 18 MAY 22

If within 5 s after reversion to V/S / FPA, to confirm the altitude target change, the flight crew does not:
- Pull the ALT knob, or
- Set a new V/S / FPA target, or
- Push the ALT pb on the FCU.

Then:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

ALT CRZ ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-30-00025283.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ engages, when ALT CRZ* is engaged, and the aircraft reaches the altitude target.

L2 ALT CRZ engages, when all of the following occur:
- ALT is engaged, and
- The aircraft altitude is equal to the FCU selected altitude, and
- The flight crew sets the cruise altitude to the aircraft altitude.

ALT CRZ DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-30-00025284.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ disengages, when any other vertical mode engages.

Intentionally left blank

General

GENERAL

Ident.: DSC-22_30-40-60-10-00025103.0001001 / 18 MAY 22
Applicable to: ALL

During descent, OP DES or DES guides the aircraft vertically to an altitude target, or to a G/S or F-G/S ◁ capture zone.

Intentionally left blank

OP DES Mode

GENERAL

Ident.: DSC-22_30-40-60-20-00025108.0001001 / 18 MAY 22
Applicable to: ALL

OP DES is a vertical selected mode.
When OP DES is engaged, the AP/FD adjusts the pitch in order to maintain a speed/Mach target (selected or managed). The A/THR then maintains idle thrust.
All the altitude constraints are disregarded.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-60-20-00025109.0001001 / 18 MAY 22
Applicable to: ALL

OP DES engages, if the FCU selected altitude is below the aircraft altitude, and the flight crew pulls the ALT knob.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-60-20-A-00025121.0001001 / 18 MAY 22

MANUAL DISENGAGEMENT

OP DES disengages manually, when one of the following occurs:
- The flight crew presses the ALT pb: ALT engages, or
- The flight crew pushes the ALT knob, and all the following conditions are applicable:
  - One of the following modes is engaged: NAV, LOC*, LOC, F-LOC ◁ *, F-LOC ◁ , LOC B/C*, LOC B/C
  - The FCU selected altitude is below the aircraft altitude
  - The FMS flight phase is cruise, or descent
  - The vertical flight plan is valid.

  DES engages, or
- The flight crew pulls or pushes the V/S / FPA knob: V/S / FPA engages, or
- The flight crew engages go-around: SRS GA engages.

Ident.: DSC-22_30-40-60-20-A-00025243.0001001 / 18 MAY 22

AUTOMATIC DISENGAGEMENT

OP DES disengages automatically, when one of the following occurs:

- ALT is armed, the aircraft reaches the capture zone of the FCU selected altitude: ALT* engages
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude: ALT CRZ* engages

Ident.: DSC-22_30-40-60-20-A-00025246.0001001 / 18 MAY 22

- The aircraft reaches the G/S capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed

  G/S* engages

Ident.: DSC-22_30-40-60-20-A-00025285.0001001 / 18 MAY 22

- The aircraft reaches the F-G/S ◁ capture zone when:
  - LOC*, LOC, F-LOC ◁ * or F-LOC ◁ is engaged
  - F-G/S ◁ is armed

  F-G/S ◁ * engages

Ident.: DSC-22_30-40-60-20-A-00025110.0001001 / 18 MAY 22

- The aircraft reaches the FINAL capture zone when:
  - APP NAV is engaged
  - FINAL is armed

  FINAL APP engages

Ident.: DSC-22_30-40-60-20-A-00025264.0001001 / 18 MAY 22

- AP/FD TCAS ◁ mode engages.

Ident.: DSC-22_30-40-60-20-A-00025122.0001001 / 18 MAY 22

REVERSION

OP DES reverts to V/S / FPA, if the flight crew sets the FCU selected altitude above the aircraft altitude.

If within 5 s after reversion to V/S / FPA, the flight crew does not confirm the altitude target change by another expected action, then:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

Intentionally left blank

DES Mode

GENERAL

Ident.: DSC-22_30-40-60-30-00025111.0001001 / 18 MAY 22
Applicable to: ALL

DES is a managed vertical mode.
DES guides the aircraft vertically along the vertical flight plan. All the altitude constraints associated to waypoints are taken into account.
When DES is engaged in idle path, the AP/FD adjusts the pitch in order to maintain a speed/Mach target. The A/THR then maintains the idle thrust.
When DES is engaged in geometric path, the AP/FD controls the vertical trajectory. The A/THR is then in SPEED/MACH.

ARMING CONDITIONS

Ident.: DSC-22_30-40-60-30-00025112.0001001 / 18 MAY 22
Applicable to: ALL

DES can only arm when:
- The altitude on the FCU is below the aircraft altitude
- NAV is armed, or engaged
- The FMS flight phase is cruise, descent, or approach
- The vertical flight plan path is valid.

DES arms, when one of the following occurs:
- DES is previously engaged with ALT CST armed, and ALT CST* engages, or
- ALT CST* or ALT CST is engaged, the flight crew pushes the ALT knob and the FMS authorizes DES to arm in accordance with the flight plan.

DISARMING CONDITIONS

Ident.: DSC-22_30-40-60-30-00025113.0001001 / 18 MAY 22
Applicable to: ALL

DES disarms, when one of the following occurs:

- NAV, LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C*, LOC B/C mode disengages, or
- Another vertical mode engages, or
- ALT CST* or ALT CST is engaged, and the flight crew sets the FCU selected altitude to the altitude constraint, or
- The flight crew sets an altitude on the FCU above the aircraft altitude, or
- The vertical flight plan is lost.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-60-30-00025114.0001001 / 18 MAY 22
Applicable to: ALL

DES engages, when one of the following occurs:
- ALT CST is engaged with DES armed, and the aircraft sequences an ALT CST waypoint, or
- The flight crew pushes the ALT knob, and all the following conditions are applicable:
  - The FCU selected altitude is below the aircraft altitude
  - One of the following lateral modes is engaged: NAV, LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C*, LOC B/C
  - One of the following vertical modes is engaged: OP DES, V/S / FPA, ALT*, ALT, ALT CRZ*, ALT CRZ, AP/FD TCAS ◁
  - The FMS flight phase is cruise, descent or approach
  - The vertical flight plan is valid.

Note: *DES will not engage if one of the following modes is engaged: G/S*, G/S, F-G/S ◁ *, F-G/S ◁ , FINAL APP, LAND.*

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-60-30-A-00025239.0001001 / 18 MAY 22

MANUAL DISENGAGEMENT

DES disengages manually, when one of the following occurs:
- The flight crew pushes the ALT pb: ALT engages
- The flight crew pulls the ALT knob: OP DES engages
- The flight crew pulls or pushes the V/S / FPA knob: V/S / FPA engages
- The flight crew engages go-around: SRS GA engages.

Ident.: DSC-22_30-40-60-30-A-00025240.0001001 / 18 MAY 22

AUTOMATIC DISENGAGEMENT

DES disengages automatically, when one of the following occurs:
- The aircraft reaches the capture zone of the FCU selected altitude: ALT* engages
- The aircraft reaches the capture zone of the altitude constraint: ALT CST* engages

Ident.: DSC-22_30-40-60-30-A-00025245.0001001 / 18 MAY 22

- The aircraft reaches the G/S capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed

  G/S* engages

Ident.: DSC-22_30-40-60-30-A-00025303.0001001 / 18 MAY 22

- The aircraft reaches the F-G/S ◁ capture zone when:
  - LOC*, LOC, F-LOC ◁ * or F-LOC ◁ is engaged, and
  - F-G/S ◁ is armed.

  F-G/S* ◁ engages.

Ident.: DSC-22_30-40-60-30-A-00025115.0001001 / 18 MAY 22

- The aircraft reaches the FINAL capture zone, when:
  - APP NAV is engaged
  - FINAL is armed

  FINAL APP engages

Ident.: DSC-22_30-40-60-30-A-00025152.0001001 / 18 MAY 22

- AP/FD TCAS ◁ mode engages.

Ident.: DSC-22_30-40-60-30-A-00025124.0001001 / 18 MAY 22

REVERSIONS

DES reverts to V/S / FPA, when one the following occurs:

- The flight crew sets the FCU selected altitude above the aircraft altitude
- One of the following modes was engaged, and disengages: NAV, LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C*, LOC B/C
- The vertical flight plan is lost.

Ident.: DSC-22_30-40-60-30-A-00025125.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

GUIDANCE IN DES MODE

Applicable to: ALL

Ident.: DSC-22_30-40-60-30-B-00010273.0001001 / 18 AUG 10

DESCENT INITIATION

The aircraft will not start its descent automatically when reaching the top of descent (T/D). In order to initiate the descent, the flight crew will set the clearance altitude by turning the ALT knob, then pushes the ALT knob.

The aircraft will descend immediately:
- If the top of descent is not reached, the aircraft descends at a constant V/S converging on the descent path
- If the aircraft is at or beyond the T/D, it descends at idle thrust.

Ident.: DSC-22_30-40-60-30-B-00010274.0001001 / 15 MAY 23

DURING THE DESCENT

In order to monitor the vertical position of the aircraft, the flight crew will see the following on the PFD:
- Vertical deviation symbol (VDEV) along the ALT scale, and
- VDEV value on the FMS PROG page.

The aircraft may deviate from the DES profile while the DES mode is engaged if:
- Unexpected wind conditions are encountered
- Anti-icing is turned on
- The flight crew modifies the lateral flight plan.

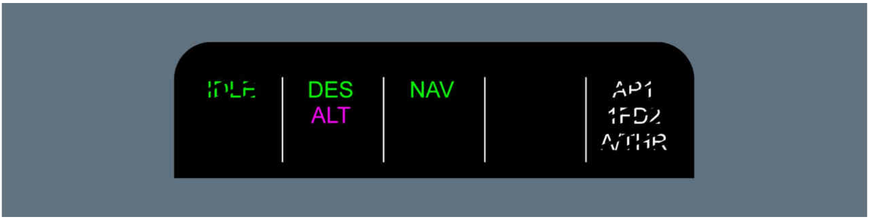
When the speed is managed, a target speed range appears on the PFD. It defines acceptable speed variations around the nominal descent speed target (limited to ± 20 kt).

Ident.: DSC-22_30-40-60-30-B-00010275.0001001 / 15 MAY 23

FMA DISPLAY

When DES mode is engaged, the FMGES arms ALT and displays the applicable target altitude on the altitude scale of the PFD.
Depending on the situation, the FMA may display one of the following cases:

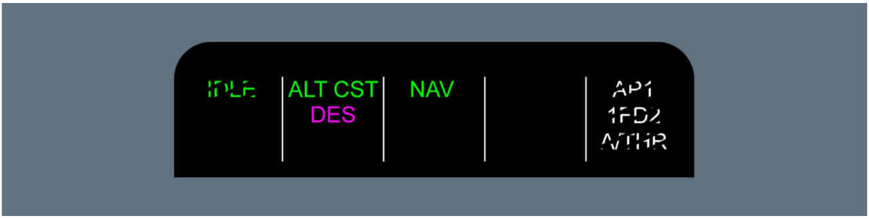
THE NEXT PREDICTED LEVEL-OFF IS AN ALTITUDE CONSTRAINT



IDLE
DES
ALT
NAV
AP1
1FD2
A/THR

The PFD displays the altitude constraint in magenta, on or below the altitude scale.

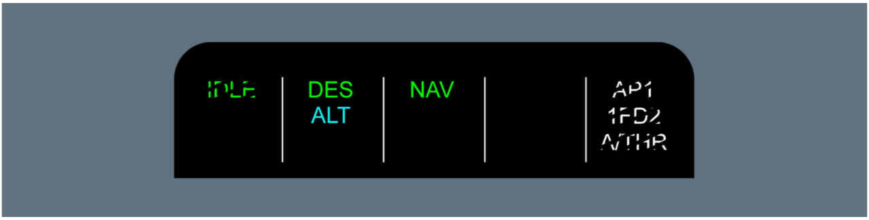
THE AIRCRAFT FLIES AN ALTITUDE CONSTRAINT



IDLE
ALT CST
DES
NAV
AP1
1FD2
A/THR

When the FMS sequences the waypoint that holds the altitude constraint, DES engages again automatically.

THE NEXT PREDICTED LEVEL-OFF IS THE FCU ALTITUDE



IDLE
DES
ALT
NAV
AP1
1FD2
A/THR

The PFD displays the FCU selected altitude in blue, on or below the altitude scale.

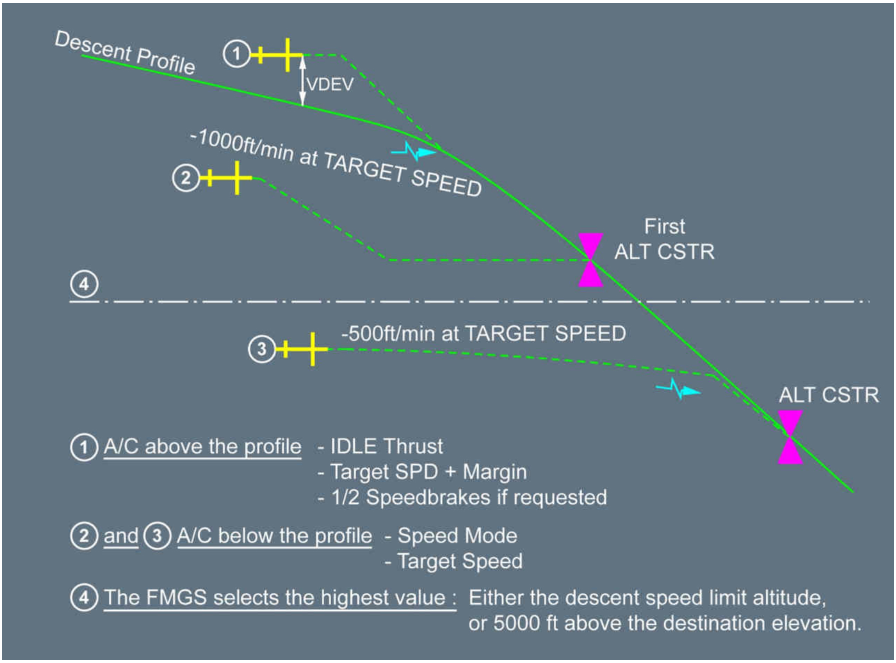
INTERCEPT POINT

Associated with the VDEV displayed on PFD, the ND shows an intercept point (↯) on the flight plan. It indicates the position where the system predicts that the aircraft will intercept the descent profile.

Ident.: DSC-22_30-40-60-30-C-00010277.0001001 / 15 MAY 23
Applicable to: ALL

INTERCEPTION OF THE DESCENT VERTICAL PROFILE

The different cases of interception of the vertical profile are described as follows.



① A/C above the profile - IDLE Thrust
- Target SPD + Margin
- 1/2 Speedbrakes if requested

② and ③ A/C below the profile - Speed Mode
- Target Speed

④ The FMGS selects the highest value : Either the descent speed limit altitude, or 5000 ft above the destination elevation.

AIRCRAFT ABOVE THE DESCENT PROFILE

If the aircraft is above the descent profile, the speed will increase toward the upper limit of the managed speed range. If the speed reaches the upper limit, the aircraft will maintain the speed but will deviate from the profile (autothrust at idle).

The pseudo waypoint (intercept point) appears on the ND along the flight plan. The FMS assumes that the aircraft will return to the profile using:
- Idle thrust
- Half speedbrakes extension
- ECON speed plus a margin (until intercepting the profile).

If necessary, the message "EXTEND SPD BRK" comes up on the FMA and the MCDU, scratchpad and remains there as long as more drag (speedbrakes) is still required. The flight crew should respond to this message by extending half speedbrakes.
Whenever the intercept point is predicted to be close to a constrained waypoint, the FMA and MCDU scratchpad display an "EXTEND SPD BRK" message.

Note: *With DES mode engaged, the speedbrakes extension will not necessarily increase the descent rate. It increases only if the aircraft is above path.*

AIRCRAFT BELOW THE DESCENT PROFILE

If the aircraft is below the descent profile, its speed will be maintained at target speed until it reaches the descent profile. The lower margin becomes effective when the aircraft is on the descent profile but has to loose speed in order to stay on it.
The intercept point on the navigation display is based on the following assumptions:

- **If the aircraft is flying at an altitude that is higher than both the descent speed limit altitude and the destination elevation +5 000 ft:**
  The FMGES maintains a V/S of -1 000 ft/min and the target speed, until the aircraft reaches the altitude constraint or intercepts the descent profile.
- **If the aircraft is flying at an altitude that is lower than either the descent speed limit altitude, or the destination elevation +5 000 ft:**
  The FMGES maintains a V/S of -500 ft/min and the target speed, until the aircraft reaches the altitude constraint or intercepts the descent profile.

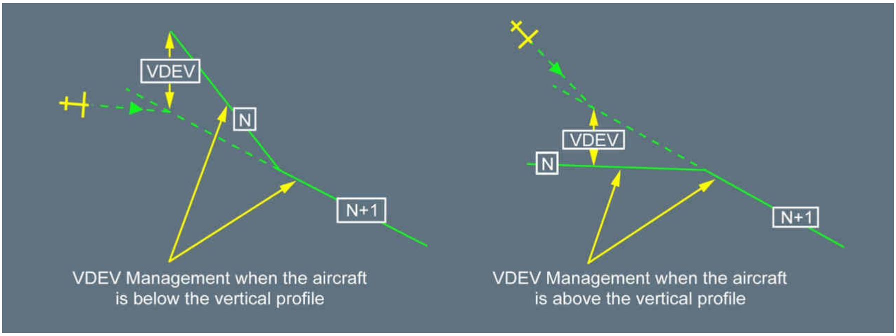
Ident.: DSC-22_30-40-60-30-C-00010316.0002001 / 15 MAY 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

VERTICAL DEVIATION (VDEV) MANAGEMENT CHARACTERISTIC

In some cases, when the aircraft is above or below the vertical profile, the ND may not display any intercept point (pseudo waypoint), even if the VDEV appears on both the MCDUs and PFDs. In addition, the FMS guidance may not immediately attempt to decrease this VDEV (contrary to flight crew expectations).

This is due to the fact that the FMS guides the aircraft along the extension of the subsequent segment (N+1), when all of the following conditions are met:
- The aircraft is above or below the descent profile
- The DES mode is active, or the FINAL APP mode is armed
- The aircraft intercepts the extension of the subsequent segment (N+1) of the vertical profile, before the aircraft reaches the initially expected segment (N), as illustrated below.

The VDEV will gradually decrease until the aircraft reaches the beginning of the subsequent segment.



VDEV
N
N+1
VDEV Management when the aircraft is below the vertical profile
VDEV
N
N+1
VDEV Management when the aircraft is above the vertical profile

Note: *For the particular case of FINAL APP mode, the FMS guides the aircraft along the extension of the subsequent segment only if the VDEV is less than 150 ft.*

Ident.: DSC-22_30-40-60-30-C-00010281.0001001 / 15 MAY 23
Applicable to: ALL

LEVELLING OFF AT A CONSTRAINT

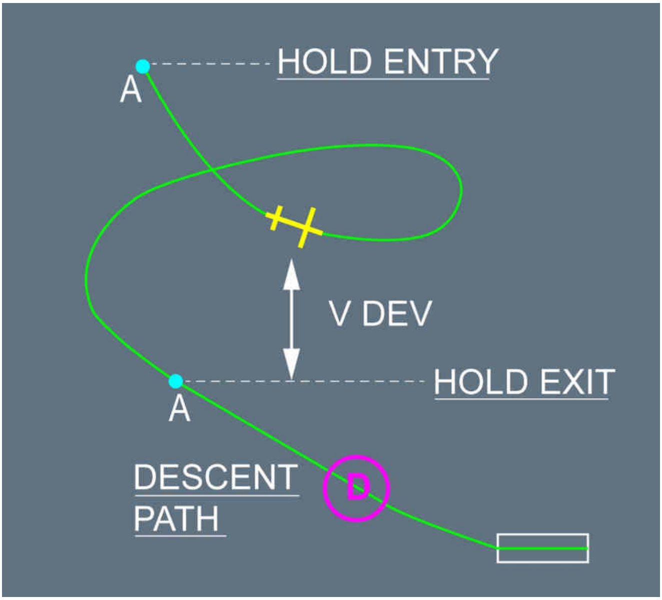
If the aircraft levels off at an altitude constraint, the DES mode arms. DES remains armed until the FMS sequences the waypoint that holds the altitude constraint. Then DES mode engages again (if the FCU altitude is set below the altitude of the constraint).
If the FCU selected altitude is an altitude constraint, the flight crew may continue the descent below that altitude by turning and then pushing the ALT knob. This arms the DES mode. When the FMS sequences the waypoint that holds the altitude constraint, the DES mode engages again.

Ident.: DSC-22_30-40-60-30-C-00010283.0001001 / 15 MAY 23
Applicable to: ALL

GUIDANCE IN A HOLD

Just before the aircraft enters a holding pattern, the speed target becomes the holding speed.
In the holding pattern, the DES mode commands a V/S of -1 000 ft while A/THR maintains the holding speed. The aircraft levels off at the next altitude constraint if it is reached during the hold.

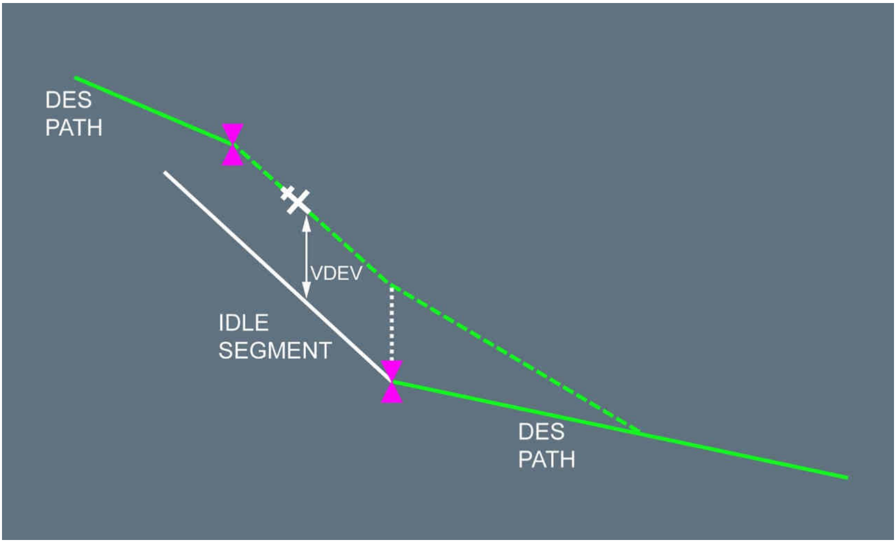
The FMS predicts the altitude at which the aircraft must cross the exit fix in order to be positioned on the descent profile. The current vertical deviation VDEV is based on this altitude.
Until the aircraft exits the hold, the DES mode maintains a V/S of -1 000 ft/min considering downpath vertical constraints. This ensures that the aircraft will not descend below the next altitude constraint. If the aircraft reaches the next altitude constraint, the aircraft levels off and ALT CST mode engages.



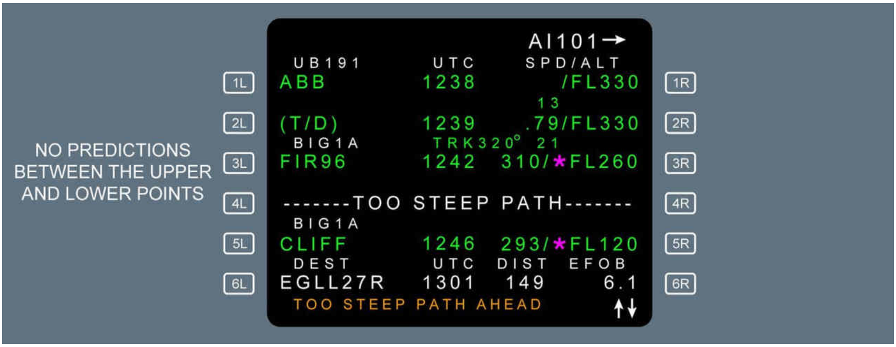
Ident.: DSC-22_30-40-60-30-C-00010285.0001001 / 15 MAY 23
Applicable to: ALL

TOO STEEP PATH

A descent segment is called “too steep path” when the FMS predicts that the descent segment between two constraint waypoints is impossible to fly at the planned descent speed with half speedbrakes extended.



When this occurs, the MCDU does not display any prediction between the upper and the lower points of the too steep path. The message “TOO STEEP PATH AHEAD” appears on the MCDU scratchpad, and the marker "TOO STEEP PATH" appears on the flight plan.



NO PREDICTIONS BETWEEN THE UPPER AND LOWER POINTS

```

  TOO STEEP PATH AHEAD              ↑↓
```

When the aircraft reaches the beginning of the too steep path segment, the FMS computes again the VDEV. An Idle segment is built starting from the end of the too steep path segment. The VDEV computation uses the Idle segment.

V/S and FPA are selected vertical modes. They are the basic modes of vertical guidance.
V/S / FPA acquires and holds the vertical speed or the flight path angle, that is displayed in the V/S / FPA window of the FCU.
When V/S / FPA engages following a reversion, the V/S / FPA target synchronizes on the current V/S / FPA of the aircraft, or the preselected V/S / FPA that is displayed in the V/S / FPA window of the FCU.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-70-A-00022597.0001001 / 04 MAY 23

V/S / FPA engages, when one of the following occurs:

- The flight crew pushes or pulls the V/S / FPA knob

L2 V/S / FPA will not engage if LAND is engaged, or SRS GA is engaged below 100 ft RA.

L1
- The APs and FDs are disengaged, and the flight crew engages the FDs or the AP HDG/TRACK also engages.
- The aircraft is airborne for at least 5 s, with no other vertical mode engaged.

V/S / FPA engages, in accordance with the HDG-V/S / TRK-FPA selection.

Ident.: DSC-22_30-40-70-A-00025154.0001001 / 18 MAY 22

REVERSIONS TO V/S / FPA

A vertical mode reverts to V/S / FPA, when one of the following occurs:

- OP DES, or DES is engaged and the FCU selected altitude is set above the aircraft altitude
- OP CLB, or CLB is engaged and the FCU selected altitude is set below the aircraft altitude
- DES is engaged and one of the following mode disengages: NAV, LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C*, LOC B/C
- FINAL APP is engaged and NAV disengages

L2
- The vertical flight plan is lost, when one of the following modes is engaged: DES, FINAL APP

L1
- G/S* or G/S is engaged, and LOC*or LOC disengages
- F-G/S* ◁ or F-G/S ◁ is engaged, and F-LOC* ◁ or F-LOC ◁ disengages
- The flight crew presses the LOC pb, or the APPR pb, when G/S*, G/S, F-G/S* ◁ or F-G/S ◁ is engaged

- ALT* is engaged, and the flight crew modifies the FCU selected altitude
- L2 The flight crew changes the approach, when one of the following vertical approach mode is engaged:
  - FINAL APP is engaged
  - G/S* or G/S is engaged, and the aircraft is below 700 ft RA
  - F-G/S* ◁ or F-G/S ◁ is engaged.

L1 Note: *The aircraft targets the preselected V/S / FPA that is displayed on the V/S / FPA window of the FCU instead of the current value, if:*
- *The reversion occurs within 45 s after the preselection of the V/S / FPA value, and*
- *The V/S / FPA mode was not engaged by the flight crew.*

As a consequence, this new V/S / FPA value may lead the aircraft to a path opposite to the current one, or to a steeper one.

The AP/FD TCAS ◁ mode can also disengaged to revert to V/S mode.

Ident.: DSC-22_30-40-70-A-00025228.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-70-B-00025090.0001001 / 18 MAY 22

MANUAL DISENGAGEMENT

V/S / FPA disengages manually, when one of the following occurs:
- The flight crew pulls the ALT knob: OP CLB or OP DES engages
- The flight crew pushes the ALT knob
  - NAV engages.
  - The FCU selected altitude is above the aircraft altitude
  - The FMS flight phase is neither descent, nor approach
  - The vertical flight plan is valid.

  CLB engages

- The flight crew pushes the ALT knob
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC B/C*, LOC B/C, F-LOC* ◁ , F-LOC ◁
  - The FCU selected altitude is below the aircraft altitude
  - The FMS flight phase is cruise, or descent
  - The vertical flight plan is valid.

  DES engages
- The flight crew pushes the ALT pb: ALT engages
- The flight crew engages go-around: SRS GA engages.

Ident.: DSC-22_30-40-70-B-00025149.0001001 / 18 MAY 22

AUTOMATIC DISENGAGEMENT

V/S / FPA disengages automatically, when one of the following occurs:

- The aircraft reaches the capture zone of the FCU selected altitude: ALT* engages
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude: ALT CRZ* engages

Ident.: DSC-22_30-40-70-B-00025150.0001001 / 18 MAY 22

- The aircraft reaches the G/S capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed

  G/S* engages

Ident.: DSC-22_30-40-70-B-00025151.0001001 / 18 MAY 22

- The aircraft reaches the F-G/S ◁ capture zone when:
  - LOC*, LOC, F-LOC* ◁ or F-LOC ◁ is engaged
  - F-G/S ◁ is armed

  F-G/S* ◁ engages

Ident.: DSC-22_30-40-70-B-00022602.0001001 / 18 MAY 22

- The aircraft reaches the FINAL capture zone, when:
  - APP NAV is engaged
  - FINAL is armed

  FINAL APP engages

Ident.: DSC-22_30-40-70-B-00025153.0001001 / 18 MAY 22

- AP/FD TCAS ◁ mode engages.

GENERAL

Ident.: DSC-22_30-40-80-00-A-00025812.0001001 / 03 MAY 23
Applicable to: ALL

Flight guidance can perform different types of approaches. *Refer to PRO-NOR-SOP-18-A Cross-Reference Table*.

Ident.: DSC-22_30-40-80-00-A-00025813.0001001 / 18 MAY 22
Applicable to: ALL

APPROACH SELECTION

STANDARD SELECTION

The flight crew selects the approach via the ARRIVAL page.

Ident.: DSC-22_30-40-80-00-A-00025814.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

MANUAL TUNING ON THE FMS

If the flight crew manually-tunes an LS approach on the RADIO NAV page, the flight guidance system will disregard the manual tuning and guide the aircraft on the approach selected on the ARRIVAL page.

L2 If the approach selected on the ARRIVAL page and the LS approach set on the RADIO NAV page are different:
- The manually-tuned LS approach on the RADIO NAV page is disregarded, and the CHECK APPR SEL message is displayed on the FMA, and on the MCDU Scratchpad.
- The aircraft will fly the approach selected on the ARRIVAL page.

Ident.: DSC-22_30-40-80-00-A-00025814.0005001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO

MANUAL TUNING ON THE FMS

If the flight crew manually-tunes an LS approach on the RADIO NAV page, the flight guidance system will guide the aircraft on the manually-tuned approach.

L2 If the approach selected on the ARRIVAL page and the LS approach set on the RADIO NAV page are different:
- The approach selected on the ARRIVAL page is disregarded, and the CHECK APPR SEL message is displayed on the FMA, and on the MCDU Scratchpad
- The aircraft will fly the manually-tuned LS approach on the RADIO NAV page.

Ident.: DSC-22_30-40-80-00-A-00025815.0001001 / 18 MAY 22
Applicable to: ALL

MANUAL TUNING ON THE RMP (BACKUP)

If all the FMCs are fault, the flight crew selects the NAV key on the RMP 1 or 2, in order to manually-tune the frequency, or select a GLS ◁ approach, or an ILS approach.

Ident.: DSC-22_30-40-80-00-A-00025816.0001001 / 18 MAY 22
Applicable to: ALL

SELECTION IN THE MMRS

When an approach is selected on the ARRIVAL page, or manually-tuned on RADIO NAV page, or via the RMP, the approach frequency and course are sent to both MMRs.
In case of discrepancy between both MMRs the NAV LS TUNING DISAGREE alert triggers.

Note: *Below 700 ft RA, when an approach mode is engaged, the flight guidance system freezes the LS selection in the MMR. As a result, the MMR does not take into account any change of the LS selection.*

ILS/GLS (IF INSTALLED)/SLS (IF INSTALLED) GUIDANCE MODE

Applicable to: ALL

Ident.: DSC-22_30-40-80-00-B-00025818.0001001 / 18 MAY 22

ILS GUIDANCE MODE

An ILS guidance mode uses the Localizer and Glideslope signals from localizer antennas and a glideslope antenna on ground.

L2 The MMR computes the ILS lateral and vertical angular deviations.

L1 The ILS lateral deviation is referred to as the LOC deviation, and the ILS vertical deviation is referred to as the G/S deviation.
The FG uses the LOC and G/S deviations in order to fly the aircraft along the LOC and G/S beams.

APPROACH MODES

The ILS guidance modes are:

	Lateral Guidance	Vertical Guidance
Above 400 ft RA	LOC*: Capture of the LOC beam LOC: Track of the LOC beam	G/S*: Capture of the G/S beam G/S: Track of the G/S beam
Below 400 ft RA, and until end of roll out	LAND: Track of LOC and G/S beams FLARE: Alignment of the yaw axis on the runway centerline, and flare on the pitch axis ROLL OUT: Track of the runway centerline, and nose down	

APPROACH AND LANDING CAPABILITY

In accordance with the approach minima and the landing technique, minimum approach and landing capabilities are required.

Ident.: DSC-22_30-40-80-00-B-00025819.0001001 / 18 MAY 22

GLS ⊲ GUIDANCE MODE

The GLS guidance mode uses the GNSS position with a correction and integrity signal from a ground station also known as GBAS.

L2 The MMR computes the GLS deviations.

L1 The GLS lateral deviation is referred to as the LOC deviation, and the GLS vertical deviation is referred to as the G/S deviation.

Note: *The computed lateral and vertical deviations are available up to 20 NM from the runway threshold.*

The FG uses the LOC and G/S deviations in order to fly the aircraft along the LOC and G/S approach path, like ILS.

APPROACH MODES

The GLS guidance modes are:

	Lateral Guidance	Vertical Guidance
Above 400 ft RA	LOC*: Capture of the LOC beam LOC: Track of the LOC beam	G/S*: Capture of the G/S beam G/S: Track of the G/S beam
Below 400 ft RA, and until end of roll out	LAND: Track of LOC and G/S beams FLARE: Alignment of the yaw axis on the runway centerline, and flare on the pitch axis ROLL OUT: Track of the runway centerline, and nose down	

APPROACH AND LANDING CAPABILITY

In accordance with the approach minima and the landing technique, minimum approach and landing capabilities are required.

Ident.: DSC-22_30-40-80-00-B-00025820.0001001 / 18 MAY 22

SLS ⊲ GUIDANCE MODE

The SLS guidance mode uses the GNSS position with a correction and integrity signal from satellite constellations also known as SBAS.
The SLS guidance mode enables the flight crew to fly an RNAV (GNSS) straight-in approach with LPV minima, or LP minima with the LOC guidance mode only.

L2 The MMR computes the SLS deviations.

L1 The SLS lateral deviation is referred to as the LOC deviation, and the SLS vertical deviation is referred to as the G/S deviation.

The FG uses the LOC and G/S deviations in order to fly the aircraft along the LOC and G/S approach path, like ILS.

APPROACH MODES

The SLS guidance modes are:

	Lateral Guidance	Vertical Guidance
Above 400 ft RA	LOC*: Capture of the LOC beam LOC: Track of the LOC beam	G/S*: Capture of the G/S beam G/S: Track of the G/S beam
Below 400 ft RA	LAND: Track of LOC and G/S beams FLARE: Alignment of the yaw axis on the runway centerline, and flare on the pitch axis ROLL OUT: Track of the runway centerline, and nose down	

APPROACH AND LANDING CAPABILITY

In accordance with the approach minima and the landing technique, minimum approach and landing capabilities are required.

FINAL APP GUIDANCE MODE

Ident.: DSC-22_30-40-80-00-00025825.0001001 / 18 MAY 22
Applicable to: ALL

APPROACH WITH FINAL APP GUIDANCE

The flight crew can use the FINAL APP mode in order to guide the aircraft laterally and vertically down to the Minimum, along the final descent profile computed by the FMS.

APPROACH MODES

The approach modes are:

Lateral Guidance	Vertical Guidance
APP NAV	FINAL
FINAL APP	

LOC Mode

GENERAL

Ident.: DSC-22_30-40-80-10-00020394.0001001 / 18 MAY 22
Applicable to: ALL

The LOC* mode captures the localizer beam of the ILS/GLS ◁ /SLS ◁ .
The LOC mode tracks the localizer beam of the ILS/GLS ◁ /SLS ◁ .

LOC ARMING CONDITIONS

Ident.: DSC-22_30-40-80-10-00020395.0001001 / 04 MAY 23
Applicable to: ALL

LOC arms, when the flight crew presses the APPR pb, or the LOC pb, and one of the following conditions is applicable:

- An ILS, GLS ◁ , or RNAV(GNSS) with LPV(LP) minima (with SLS ◁ option) approach is set on the ARRIVAL page
- An ILS, GLS ◁ is manually-tuned on the RADIO NAV page

L2 *Note:* *If the flight crew sets a different ILS approach on the ARRIVAL page:*
- *The aircraft will fly the manually-tuned LS*
- *The MCDU displays the RWY/LS MISMATCH message.*

- At least one LS receiver must be operative. If both receivers are operative, the LS parameters must be the same in both LS receivers

L1 - A LOC only approach is set on the ARRIVAL page

L2 *Note:* *On aircraft equipped with the FLS ◁ function , the flight crew can also deselect the G/S of an ILS approach on the RADIO NAV page*

L1 - The ILS frequency / GLS ◁ channel and course are manually-tuned on the RMP.

L2 LOC can only arm when all of the following are applicable:
- HDG/TRACK or NAV is engaged, and
- The vertical mode is not SRS TO, nor SRS GA, and
- The aircraft is above 400 ft RA.

LOC DISARMING CONDITIONS

Ident.: DSC-22_30-40-80-10-00020396.0001001 / 18 MAY 22
Applicable to: ALL

LOC disarms, when LOC* engages.

L2 LOC also disarms, when one of the following occurs:
- G/S or F-G/S ◁✱ is armed, and the flight crew presses the APPR pb, or
- Neither G/S, nor F-G/S ◁✱ is armed, and the flight crew presses the LOC pb, or
- NAV arms, or
- The flight crew engages go-around, or
- The flight crew modifies the approach selection, or

  Note: *The flight crew can change the approach selection, only when the aircraft is above 700 ft RA.*

- The LS parameters are different in both LS receivers.

LOC* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-10-A-00020347.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP

LOC* engages, when LOC is armed, and the aircraft reaches the capture zone.

Ident.: DSC-22_30-40-80-10-A-00020347.0002001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

LOC* engages, when LOC is armed, and the aircraft reaches the capture zone, or the pre-capture zone of the LOC beam.

PRE-CAPTURE ZONE OF THE LOC BEAM (ENHANCED LOC CAPTURE FUNCTION)

The pre-capture zone of the LOC beam is introduced through the Enhanced LOC Capture function. With the enhanced LOC Capture function, the aircraft uses the aircraft position and the FMS trajectory to provide guidance in order to pre-capture the LOC beam.

The pre-capture of the LOC beam allows to:
- Enhance the performance of the LOC capture
- Avoid a false capture
- Capture the LOC beam without overshoot.

The pre-capture zone is available, when all of the following conditions are applicable:
- The LOC deviation is more than 2.3 dots, and
- The FMS is in GPS PRIMARY ◁✱ , and
- L2 The difference between the track and the LOC course is between 25 ° and 115 °, and
- The roll order is such that LOC* will capture the LOC beam with a single turn.

L1 *Note:* *On the PFD and on the ND, the flight crew observes movement of the LOC deviation toward the center of the scale, only when the LOC deviation is less than 2 dots. This occurs when the aircraft is in the capture zone.*

Ident.: DSC-22_30-40-80-10-A-00020346.0001001 / 18 MAY 22
Applicable to: ALL

CAPTURE ZONE OF THE LOC BEAM

The aircraft reaches the capture zone of the LOC beam, when one of the following occurs:

- The LOC deviation is less than 2.3 dots, and:
  - L2 The difference between the track and the LOC course is between 25 ° and 115 ° , and
  - The roll order is such that LOC* will capture the LOC beam with a single turn.
- L1 The LOC deviation is less than 1.3 dot, and the difference between the track and the LOC course is less than 15 °.

L2 If the approach is an ILS, the LOC* mode uses the ILS LOC deviation to perform the capture.

L1 Note: *During the LOC capture, the LOC deviation starts to move toward the center of the LS scale, on the PFD and ND, when the LOC deviation is less than 2 dots.*

Ident.: DSC-22_30-40-80-10-A-00021659.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP, LV-KHT, LV-KHU

LOC CONVERGENCE FUNCTION

The purpose of the LOC convergence function is to help to intercept and capture the LOC axis.

The flight guidance intercepts the LOC axis with a 20 ° track convergence, when all the following conditions are applicable:

- The LOC mode is armed, and
- The NAV mode is engaged, and
- The aircraft is within 20 NM of the destination runway, and
- The difference between the aircraft track and the runway course is less than 20 °.

LOC* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-80-10-B-00020390.0001001 / 04 MAY 23

LOC* disengages, when another lateral mode engages.

L2 LOC* disengages, when one of the following occurs:

- The aircraft becomes established on the LOC beam: LOC engages, or
- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged: HDG/TRACK engages, or
- The flight crew pulls the HDG/TRK knob: HDG/TRACK engages, or
- The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO: NAV engages, or
- The flight crew performs a go-around.

Ident.: DSC-22_30-40-80-10-B-00020392.0001001 / 04 MAY 23

REVERSIONS

LOC* reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - G/S is armed, or
  - G/S* is engaged, or
  - G/S is engaged, or
  - F-G/S ◁ is armed, or
  - F-G/S* ◁ is engaged, or
  - F-G/S ◁ is engaged.
- The flight crew inserts a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT in the active flight plan
- L2 The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page
- The FG detects a difference between both MMRs.

L1 When LOC* reverts to HDG/TRACK, the vertical mode also reverts to V/S / FPA.

Ident.: DSC-22_30-40-80-10-B-00020393.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

LOC ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-10-00020397.0001001 / 18 MAY 22
Applicable to: ALL

LOC engages, when LOC* is engaged, and the aircraft becomes established on the LOC beam.

LOC DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-80-10-C-00020398.0001001 / 04 MAY 23

LOC disengages, when another lateral mode engages.

L2 LOC disengages, when one of the following occurs:

- G/S is engaged, and LAND engages, or
- The flight crew presses the LOC pb, and there is no vertical managed mode of approach, armed or engaged, HDG/TRACK engages, or.

- The flight crew pulls the HDG/TRK knob, HDG/TRACK engages, or
- The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO, NAV engages, or
- The flight crew performs a go-around.

Ident.: DSC-22_30-40-80-10-C-00020399.0001001 / 04 MAY 23

REVERSIONS

LOC reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - G/S is armed, or
  - G/S* is engaged, or
  - G/S is engaged, or
  - F-G/S ◁ is armed, or
  - F-G/S* ◁ is engaged, or
  - F-G/S ◁ is engaged.
- The flight crew inserts a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT in the active flight plan
- L2 The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page
- The FG detects a difference between both MMRs.

L1 When LOC reverts to HDG/TRACK, the vertical mode also reverts to V/S / FPA.

Ident.: DSC-22_30-40-80-10-C-00020400.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

Intentionally left blank

G/S Mode

GENERAL

Ident.: DSC-22_30-40-80-20-00020435.0001001 / 18 MAY 22
Applicable to: ALL

The G/S* mode captures the glide slope beam of the ILS / GLS ◁ / SLS ◁ .
The G/S mode tracks the glide slope beam of the ILS / GLS ◁ / SLS ◁ .

Note: *In accordance with the below G/S and G/S* engagement conditions, G/S or G/S* modes may engage at altitudes that are above the radio altimeter validity. In that case, the landing capability displayed on the FMA (CAT1) reflects the lack of radio altimeter validity until the radio altimeter becomes active. If the radio altimeters fail, or if the FGs don't receive any radio altimeter data, then LOC, G/S and both AP/FDs disengage and FDs re-engage on basic modes.*

G/S ARMING CONDITIONS

Ident.: DSC-22_30-40-80-20-00020436.0001001 / 18 MAY 22
Applicable to: ALL

G/S arms, when the flight crew presses the APPR pb, and one of the following conditions is applicable:

- An ILS, GLS ◁ , or RNAV(GNSS) with LPV minima (with SLS ◁ option) approach is set on the ARRIVAL page
- An ILS, or GLS ◁ approach is manually tuned on the RADIO NAV page

Note: *If the flight crew sets a different LS approach on the ARRIVAL page:*
- *The aircraft will fly the manually-tuned LS*
- *The MCDU displays the RWY/LS MISMATCH message.*

L2 - At least one LS receiver must be operative. If both receivers are operative, the LS parameters must be the same in both LS receivers
L1 - The ILS frequency / GLS ◁ channel and course are manually-tuned on the RMP

L2 G/S can only arm when all of the following are applicable:
- The mode is not SRS, RWY, RWY TRK, GA TRK
- The aircraft is above 400 ft RA.

G/S DISARMING CONDITIONS

Ident.: DSC-22_30-40-80-20-00020437.0001001 / 18 MAY 22
Applicable to: ALL

G/S disarms, when G/S* engages.

L2 G/S also disarms, when one of the following occurs:

- The flight crew presses the APPR pb, or the LOC pb, or
- LOC disarms, or
- LOC*, or LOC is lost, or
- The AP/FD TCAS ◁ mode engages upon a RA, or
- The flight crew modifies the approach selection, or

  Note: *The flight crew can change the approach selection, only when the aircraft is above 700 ft RA.*

- The flight crew performs a go around, SRS GA and GA TRK engage.

G/S* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-20-00020403.0001001 / 04 MAY 23
Applicable to: ALL

G/S* engages when the aircraft reaches the capture zone of the G/S beam, and all of the following conditions are applicable:

- G/S is armed, and
- LOC* or LOC is engaged.

L2 The aircraft reaches the capture zone of the G/S beam, when one of the following occurs:

- Passage far from the G/S beam:
  - The G/S deviation is less than 2 dots, and:
  - The pitch order is such that G/S* will capture the G/S beam with a single maneuver.
- Passage near the G/S beam: The G/S deviation is less than a threshold depending on the radio altitude.
  This threshold is between 0.1 and 1/3 dot.

G/S* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-80-20-A-00020404.0001001 / 18 MAY 22

G/S* disengages, when another vertical mode engages.

L2 G/S* disengages, when one of the following occurs:

- The aircraft becomes established on the G/S beam: G/S engages
  G/S* is engaged for more than 15 s, and the G/S deviation becomes less than 1/3 dot.
- The flight crew pushes or pulls the V/S / FPA knob: V/S / FPA engages
- The flight crew pulls the ALT knob: OP CLB or OP DES engages
- The flight crew presses the ALT knob: ALT engages

- The AP/FD TCAS mode engages upon a RA (if LOC is engaged, LOC remains engaged, APPR pb comes off and the LOC pb comes on)
- The flight crew performs a go-around.

Ident.: DSC-22_30-40-80-20-A-00020432.0001001 / 04 MAY 23

REVERSIONS

G/S* reverts to V/S / FPA, when one of the following occurs:

- LOC disengages: The lateral mode also reverts to HDG/TRACK
- The flight crew presses the APPR pb: The lateral mode also reverts to HDG/TRACK
- The flight crew pulls the HDG/TRK knob: The lateral mode also reverts to HDG/TRACK
- The flight crew presses the LOC pb
- L2 The aircraft is above 700 ft RA, and the flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page. The lateral mode also reverts to HDG/TRACK
- The FG detects a difference between both MMRs.

Ident.: DSC-22_30-40-80-20-A-00020433.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

G/S ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-20-00021652.0001001 / 18 MAY 22
Applicable to: ALL

G/S engages, when G/S* is engaged, and the aircraft becomes established on the G/S beam.

G/S DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-80-20-B-00020401.0001001 / 04 MAY 23

G/S disengages, when another vertical mode engages.

L2 G/S disengages, when one of the following occurs:

- LAND engages at 400 ft RA, if the approach and landing capability is CAT1, CAT2 or CAT3, or
- The flight crew pushes or pulls the V/S / FPA knob, V/S / FPA engages, or
- The flight crew pulls the ALT knob, OP CLB or OP DES engages, or
- The flight crew presses the ALT knob, ALT engages, or

- The AP/FD TCAS mode engages upon a RA (if LOC is engaged, LOC remains engaged, APPR pb comes off and the LOC pb comes on), or
- The flight crew performs a go-around.

Ident.: DSC-22_30-40-80-20-B-00020402.0001001 / 04 MAY 23

REVERSIONS

G/S reverts to V/S / FPA, when one of the following occurs:

- LOC disengages: The lateral mode also reverts to HDG/TRACK
- The flight crew presses the APPR pb: The lateral mode also reverts to HDG/TRACK
- The flight crew presses the LOC pb
- The flight crew pulls the HDG/TRK knob: The lateral mode also reverts to HDG/TRACK
- L2 The aircraft is above 700 ft RA, and the flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page. The lateral mode also reverts to HDG/TRACK
- The FG detects a difference between both MMRs.

Ident.: DSC-22_30-40-80-20-B-00020345.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

LAND Mode

GENERAL

Ident.: DSC-22_30-40-80-30-00021698.0001001 / 18 MAY 22
Applicable to: ALL

The LAND mode is a common vertical and lateral mode.
The LAND mode tracks the LOC and G/S beams from 400 ft RA to approximately 60 ft RA.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-30-00021699.0001001 / 18 MAY 22
Applicable to: ALL

LAND automatically engages, when all the following conditions are applicable:
- The approach and landing capability is CAT1, CAT2 or CAT3, and
- LOC and G/S are engaged, and
- The aircraft is below 400 ft RA.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-30-00021702.0001001 / 18 MAY 22
Applicable to: ALL

LAND automatically disengages, when the aircraft approximately reaches 60 ft RA: FLARE engages.
When LAND is engaged, no action on the FCU can disengage LAND.
The flight crew can only disengage LAND by performing a go-around.

Intentionally left blank

FLARE Mode

GENERAL

Ident.: DSC-22_30-40-80-40-00021792.0001001 / 04 MAY 23
Applicable to: ALL

The FLARE mode is a common lateral and vertical mode:

- Lateral guidance: The FLARE mode reduces the sideslip angle, such that the aircraft will be aligned with the runway centerline at the aircraft touchdown
- Vertical guidance: The FLARE mode decreases the descent rate, in order to ensure a comfortable transition between the glide tracking, and the aircraft touchdown.
- If the A/THR is active, the thrust is automatically reduced to IDLE.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-40-00021793.0001001 / 18 MAY 22
Applicable to: ALL

FLARE engages, if all the following conditions are applicable:

- The aircraft approximately reaches 60 ft RA
- The approach that the flight crew selects is either an ILS approach, a GLS ◁ approach, or an RNAV(GNSS) approach with LPV minima (with SLS ◁).

L2 FLARE engages only if the following conditions are applicable:

- The slats/flaps are extended, or the landing gears are extended
- One valid RA.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-40-00021794.0001001 / 18 MAY 22
Applicable to: ALL

FLARE automatically disengages, when the aircraft touches down: ROLL OUT engages.
The flight crew can only disengage FLARE by performing a go-around.

Intentionally left blank

ROLL OUT Mode

GENERAL

Ident.: DSC-22_30-40-80-50-00021795.0001001 / 18 MAY 22
Applicable to: ALL

The ROLL OUT mode is a common lateral and vertical mode:
- Lateral guidance: the ROLL OUT mode guides the aircraft along the runway centerline
- Vertical guidance: The ROLL OUT mode lands the nose landing gear.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-50-00021796.0001001 / 18 MAY 22
Applicable to: ALL

The FLARE mode changes to the ROLL OUT mode when the aircraft touches down.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-50-00021797.0001001 / 18 MAY 22
Applicable to: ALL

ROLL OUT disengages, when one of the following occurs:
- The aircraft exits the runway, or

L2 Note: *When the difference between the aircraft track and the runway track is more than 20°, the ROLL OUT disengages due to the APs and FDs disengagement.*

L1 - The flight crew engages a go-around.

Intentionally left blank

LOC B/C Mode

GENERAL

Ident.: DSC-22_30-40-80-80-00021878.0001001 / 18 MAY 22
Applicable to: ALL

The LOC B/C* mode captures the localizer back beam of the ILS.
The LOC B/C mode tracks the localizer back course beam of the ILS.

LOC B/C ARMING CONDITIONS

Ident.: DSC-22_30-40-80-80-00021879.0001001 / 04 MAY 23
Applicable to: ALL

L2 LOC B/C can only arm when all of the following are applicable:
- At least one LS receiver must be operative. If both receivers are operative, the LS parameters must be the same in both LS receivers.
- HDG/TRACK or NAV is engaged, and
- The aircraft is above 400 ft RA.

L1 LOC B/C arms, when:
- The flight crew selected a LOC B/C approach on the ARRIVAL page, and
- The flight crew presses the LOC pb.

LOC B/C DISARMING CONDITIONS

Ident.: DSC-22_30-40-80-80-00021880.0001001 / 18 MAY 22
Applicable to: ALL

LOC B/C disarms, when LOC B/C* engages.

L2 LOC B/C also disarms, when one of the following occurs:
- F-G/S ◁ is armed, and the flight crew presses the APPR pb, or
- F-G/S ◁ is not armed, and the flight crew presses the LOC pb, or
- NAV arms, or
- The flight crew engages go-around, or
- The flight crew modifies the approach selection, or
- The LS parameters are different in both LS receivers.

LOC B/C* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-80-00021883.0001001 / 18 MAY 22
Applicable to: ALL

LOC B/C* engages, when LOC B/C is armed, and the aircraft reaches the capture zone of the LOC B/C beam.

CAPTURE ZONE OF THE LOC BEAM

The aircraft reaches the capture zone of the LOC B/C beam, when one of the following occurs:

- The LOC B/C deviation is less than 2.3 dots, and

L2
  - The difference between the track and the LOC B/C course is between 25 ° and 115 ° , and
  - The roll order is such that LOC B/C* will capture the LOC B/C beam with a single turn.

L1
- The LOC B/C deviation is less than 1.3 dot, and the difference between the track and the LOC B/C course is less than 15 °.

LOC B/C* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-80-80-A-00021884.0001001 / 04 MAY 23

LOC B/C* disengages, when another lateral mode engages.

L2 LOC B/C* disengages, when one of the following occurs:

- The aircraft becomes established on the LOC B/C beam: LOC B/C engages, or
- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged: HDG/TRACK engages, or

  Note: *If a vertical managed mode of approach was previously engaged: LOC B/C* remains engaged, and a vertical mode reversion occurs.*

- The flight crew pulls the HDG/TRK knob: HDG/TRACK engages, or
- The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO: NAV engages, or
- The flight crew performs a go-around: SRS GA and GA TRK engage.

Ident.: DSC-22_30-40-80-80-A-00021885.0001001 / 04 MAY 23

REVERSIONS

LOC B/C* reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - F-G/S is armed, or
  - F-G/S* is engaged, or
  - F-G/S is engaged.
- The flight crew inserts a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT in the active flight plan
- L2 The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page
- The FG detects a difference between both MMRs.

L1 When LOC B/C* reverts to HDG/TRACK, the vertical mode also reverts to V/S/FPA.

Ident.: DSC-22_30-40-80-80-A-00025786.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10s
- The FD bars flash for 10s.

LOC B/C ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-80-00021887.0001001 / 18 MAY 22
Applicable to: ALL

LOC B/C engages, when LOC B/C* is engaged, and the aircraft becomes established on the LOC B/C beam.

LOC B/C DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-80-80-B-00021888.0001001 / 04 MAY 23

LOC B/C disengages, when another lateral mode engages.

L2 LOC B/C disengages, when one of the following occurs:

- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged: HDG/TRACK engages, or
- The flight crew pulls the HDG/TRK knob: HDG/TRACK engages, or
- The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO: NAV engages, or
- The flight crew performs a go-around: SRS GA and GA TRK engage.

Ident.: DSC-22_30-40-80-80-B-00021889.0001001 / 04 MAY 23

REVERSIONS

LOC B/C reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb , and one of the following conditions is applicable:
  - F-G/S is armed, or
  - F-G/S* is engaged, or
  - F-G/S is engaged.
- The flight crew inserts a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT in the active flight plan
- L2 The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page
- The FG detects a difference between both MMRs.

L1 When LOC B/C reverts to HDG/TRACK, the vertical mode also reverts to V/S/FPA.

Ident.: DSC-22_30-40-80-80-B-00025787.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10s
- The FD bars flash for 10s.

FINAL APP Mode

GENERAL

Ident.: DSC-22_30-40-80-90-00019653.0001001 / 18 MAY 22
Applicable to: ALL

FINAL APP is a lateral and vertical managed guidance approach mode that guides the aircraft during the final approach.

The FINAL APP mode includes the following modes:
- APP NAV mode for lateral guidance
- FINAL mode for vertical guidance.

APP NAV AND FINAL ARMING CONDITIONS

Ident.: DSC-22_30-40-80-90-00022031.0001001 / 18 MAY 22
Applicable to: ALL

APP NAV and FINAL modes arms, when all the following conditions are applicable:
- The flight crew presses the APPR pb
- The active flight plan is valid (lateral and vertical profile)
- The approach selected in the ARRIVAL page is compatible with the FINAL APP function (*Refer to PRO-NOR-SOP-18-A Cross-Reference Table*).

Note: *If an RNAV visual approach is selected, the flight crew must deselect the FLS mode via the PERF APPR page.*

APP NAV AND FINAL DISARMING CONDITIONS

Ident.: DSC-22_30-40-80-90-00022032.0001001 / 18 MAY 22
Applicable to: ALL

APP NAV and FINAL modes disarms, when one of the following conditions occurs:
- The flight crew presses the APPR pb: NAV remains armed or NAV remains engaged
- The flight crew presses the LOC pb arming LOC mode
- NAV disarms, or NAV engages
- The flight crew performs a go around
- The flight crew modifies the approach selection (for some FG standards)
- The FMS vertical profile is lost
- AP/FD TCAS mode engages. In this case, FINAL disengages and NAV remains engaged.

APP NAV ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-90-00022036.0001001 / 04 MAY 23
Applicable to: ALL

APP NAV and NAV modes engage under the same conditions:
- If NAV is engaged, APP NAV engages immediately
- If HDG/TRACK is engaged, APP NAV engages when the intercept conditions are met (the aircraft track line must intercept the flight plan active leg).

APP NAV DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-90-00022045.0001001 / 18 MAY 22
Applicable to: ALL

APP NAV and NAV modes disengage under the same conditions (*Refer to DSC-22_30-40-30-20 Disengagement Conditions*).

FINAL APP ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-90-A-00025790.0003001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

FINAL APP mode engages when all the following conditions are applicable:
- The aircraft is in the capture zone of the vertical FMS profile

L2 The vertical capture zone above and below the vertical FMS profile is defined as follow:
- Laterally: ±1.5 NM from the Final Descent Point.
- Vertically: +250 ft above the Final Descent Point.

Ident.: DSC-22_30-40-80-90-A-00025790.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP

FINAL APP mode engages when all the following conditions are applicable:
- The aircraft is in the capture zone of the vertical FMS profile

L2 The vertical capture zone above and below the vertical FMS profile is defined as follow:
- Laterally: ±1.5 NM from the Final Descent Point
- Vertically: +150 ft above the Final Descent Point.

Ident.: DSC-22_30-40-80-90-A-00022037.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP

- NAV or APP NAV is engaged
- FINAL is armed
- Predictions are available in FMS

- APPROACH phase is active, and the deceleration point has sequenced

  Note: *APPROACH phase may have to be manually activated on PERF APPR page if the approach starts at high altitude above aerodrome level (i.e. RNAV(RNP) approaches).*

- The aircraft intercepts a descending leg of the vertical flight path.

  Note: *If APPR pb is pressed earlier, FINAL APP mode may engage. As a consequence, resulting speed and altitude management in the FINAL APP may be inappropriate before FDP.*

A blue arrow is displayed on NDs to indicate where the FINAL APP engagement conditions are met and where the final descent will begin automatically.
If the same arrow is displayed in white, at least one engagement condition is not fulfilled, FINAL APP will not engage and the aircraft will not descend automatically.

Ident.: DSC-22_30-40-80-90-A-00022037.0002001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

- NAV or APP NAV is engaged
- FINAL is armed
- Predictions are available in FMS
- APPROACH phase is active

  Note: *APPROACH phase may have to be manually activated on PERF APPR page if the approach starts at high altitude above aerodrome level (i.e. RNAV(RNP) approaches).*

- The aircraft intercepts a descending leg of the vertical flight path.

  Note: *If APPR pb is pressed earlier, FINAL APP mode may engage. As a consequence, resulting speed and altitude management in the FINAL APP may be inappropriate before FDP.*

A blue arrow is displayed on NDs to indicate where the FINAL APP engagement conditions are met and where the final descent will begin automatically.
If the same arrow is displayed in white, at least one engagement condition is not fulfilled, FINAL APP will not engage and the aircraft will not descend automatically.

Ident.: DSC-22_30-40-80-90-A-00022038.0001001 / 18 MAY 22
Applicable to: ALL

DEFINITION OF THE FINAL DESCENT POINT (ALSO CALLED VERTICAL INTERSECTION POINT "VIP" FOR RNAV (RNP) APPROACHES)

The FDP is the waypoint from which starts the FMS segment with coded FPA. For RNAV(RNP) approaches, this point may be indicated on the chart as FDP or "VIP".

This point is defined in the Navigation Database by:
- A constant vertical flight path beyond this point,
- A coded altitude constraint that may be "at" or "at or above" (e.g. +3 000 ft). This constraint is displayed on ND (in magenta), next to the corresponding waypoint, when the CSTR key is selected on the EFIS Control Panel. It is also shown on the F-PLN page at this WPT.

Note: *The FAF is the position from where the obstacle clearance is defined relative to an OCS. Obstacle clearance is only ensured if the aircraft is flying on the defined vertical flight path. Before the FAF, minimum altitudes are published with fixed MOC. The FDP is the point in the procedure at or before the FAF from which a constant vertical flight path is defined.*

FINAL APP DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-90-B-00022039.0001001 / 18 MAY 22
Applicable to: ALL

The FINAL APP mode disengages:
- When the AP/FD TCAS mode engages upon a RA, the FINAL mode disengages and the lateral NAV mode remains engaged. The APPR pb comes off

Ident.: DSC-22_30-40-80-90-B-00022040.0002001 / 18 MAY 22
Applicable to: ALL

- The flight crew pushes, or pulls out the V/S / FPA knob: V/S / FPA engages, NAV remains engaged

Ident.: DSC-22_30-40-80-90-B-00022041.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP

- Automatically at minimum -50 ft, or 400 ft AGL, if the flight crew does not enter any minimum
- The flight crew performs a go-around.

Ident.: DSC-22_30-40-80-90-B-00022041.0002001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

- Automatically at MAP
- The flight crew performs a go-around.

Ident.: DSC-22_30-40-80-90-B-00022043.0001001 / 04 MAY 23
Applicable to: ALL

REVERSIONS

FINAL APP reverts to V/S / FPA, when one of the following occurs:
- NAV disengages: The lateral mode also reverts to HDG/TRACK, or
- If the flight crew pulls out the HDG/TRK knob: The lateral mode also reverts to HDG/TRACK, or

- The flight crew presses the APPR pb: The lateral mode remains engaged in NAV, or
- If the flight crew presses the LOC pb: The lateral mode also reverts to HDG-V/S and LOC arms if an ILS / GLS approach is selected, or
- The FMS flight phase is no longer cruise (CRZ), descent (DES) or approach (APPR), or
- L2 The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page.
  The lateral mode also reverts to HDG/TRACK.

Ident.: DSC-22_30-40-80-90-B-00022044.0001001 / 18 MAY 22
Applicable to: ALL

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

Intentionally left blank

General

GENERAL

Ident.: DSC-22_30-40-90-10-00022079.0002001 / 05 MAR 19
Applicable to: LV-GKO, LV-GKP

Go-around combines SRS GA vertical mode, and GA TRK lateral mode.
SRS GA and GA TRK engage at the same time. They disengage at different moment.

At go-around engagement (i.e. SRS GA and GA TRK engage):
- The FMS flight phase becomes go-around
- If not previously engaged, the FDs automatically engage
- If FPD/FPV was previously displayed, it reverts to FD bars.

GENERAL

Ident.: DSC-22_30-40-90-10-00022079.0003001 / 04 MAY 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

When the flight crew initiates a go-around, the SRS GA vertical mode engages. In addition, one of the following occurs:

- If a lateral managed mode is engaged (except NAV mode), GA TRK engages, and NAV mode arms
  NAV automatically engages as soon as the aircraft reaches the capture zone of the flight plan active leg.

  Note: If a HDG/TRK was preset, NAV mode does not arm. GA TRK engages, until the flight crew pulls the HDG/TRK knob to follow the preset target.

Example: Go-around during an ILS approach

- The FMS flight phase becomes go-around
- If not previously engaged, the FDs automatically engage
- If FPD/FPV was previously displayed, it reverts to FD bars.

Intentionally left blank

SRS GA Mode

GENERAL

Ident.: DSC-22_30-40-90-20-A-00022080.0002001 / 05 MAR 19
Applicable to: ALL

The SRS mode is a managed vertical mode. This mode is applicable during takeoff and go-around.
This chapter is only about the SRS mode during go-around, also referred to as SRS GA mode.
The FMA displays SRS, when the SRS GA mode engages.
The SRS GA controls the speed target via the elevators.

L2 The guidance law also includes:
- A flight path angle protection, that ensures a positive climb
- A pitch angle protection to reduce the aircraft nose-up (17.5 ° of maximum pitch attitude).
- A speed protection, that ensures the aircraft does not exceed VFE.

L1 The speed target is the memorized aircraft speed at SRS GA engagement or VAPP, whichever is higher.

L2 The higher limit of the target is the lowest value between:
- 25 kt above VLS (or 15 kt above VLS when one engine is inoperative)
- 5 kt below VMAX.

L1 *Note:* *At SRS GA engagement, the speed becomes managed.*

Ident.: DSC-22_30-40-90-20-A-00022359.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP

When the SRS GA mode disengages, the speed target becomes Green Dot Speed.

Ident.: DSC-22_30-40-90-20-A-00022359.0002001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

When the SRS GA mode disengages, the speed target becomes the smaller of Green Dot Speed or the speed constraints.

Note: *If the FMS flight phase is cruise, the SPD LIM or the SPD CSTR are still respected.*

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-90-20-00022081.0001001 / 04 MAY 23
Applicable to: ALL

SRS GA engages when all of the following conditions are applicable:
- The flight crew sets at least one thrust lever to the TOGA detent
- The flaps lever is at least in position 1
- The aircraft is airborne, or on ground for less than 30 s.

SRS GA mode can be engaged regardless of the vertical mode (except SRS TO).

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-90-20-B-00022082.0001001 / 18 MAY 22

The SRS GA mode disengages when one of the following occur:
- At the go-around acceleration altitude (GA ACC ALT), or if ALT* or ALT CST* engages (above 400 ft RA)
- If the flight crew engages another vertical mode
- If the selected target altitude is above the aircraft altitude and the flight crew selects a speed: SRS GA reverts to OP CLB
- If the AP/FD TCAS ◁ mode engages upon a RA.

Note: *1. In Engine Out conditions, the SRS GA mode does not automatically disengage at EO ACC ALT.*
2. In dual AP configuration, disengagement of the go-around mode, on either axis, causes AP 2 to disconnect.

Ident.: DSC-22_30-40-90-20-B-00022380.0001001 / 18 MAY 22

REVERSIONS

When SRS GA reverts to OP CLB, the following occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s.

GA TRK Mode

GENERAL

Ident.: DSC-22_30-40-90-30-00022083.0001001 / 05 MAR 19
Applicable to: ALL

The GA TRK mode is a managed lateral mode that is applicable during go-around.
The GA TRK mode maintains the track of the aircraft, when the mode engages.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-90-30-00022084.0002001 / 04 MAY 23
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

GA TRK engages when all of the following conditions are applicable:
- The flight crew sets at least one thrust lever to the TOGA detent
- The slats or the flaps are extended
- The aircraft is airborne, or on ground for less than 30 s
- NAV, HDG, or TRACK is not engaged.

GA TRK simultaneously engages with SRS GA.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-90-30-00022084.0001001 / 05 MAR 19
Applicable to: LV-GKO, LV-GKP

GA TRK engages, when all of the following conditions are applicable:
- The flight crew sets at least one thrust lever to the TOGA detent
- The slats or the flaps are extended
- The aircraft is airborne, or on ground for less than 30 s.

GA TRK simultaneously engages with SRS GA.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-90-30-00022085.0001001 / 05 MAR 19
Applicable to: ALL

GA TRK disengages when another lateral mode engages.

L2 GA TRK cannot be disengaged below 100 ft RA.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-40-100-00022603.0001001 / 18 MAY 22
Applicable to: LV-KAN, LV-KAO

The AP/FD TCAS mode is an AP/FD vertical mode, that provides vertical guidance in the case of a RA alert, generated by the TCAS.
When a TA is triggered, the AP/FD TCAS mode arms.

When an RA is triggered, the AP/FD TCAS mode engages to provide guidance in accordance with the RA order:
- The AP status does not change: Remains engaged or disengaged
- If not previously engaged, the FDs automatically engage.

When the "CLEAR OF CONFLICT" aural alert sounds, the AP/FD TCAS mode disengages.
The AP/FD provides guidance toward the latest target altitude set on the FCU.

AP/FD TCAS MODE AVAILABILITY

Ident.: DSC-22_30-40-100-00022604.0001001 / 18 MAY 22
Applicable to: LV-KAN, LV-KAO

The AP/FD TCAS mode is available, when all of the following conditions are met:
- The aircraft is above 900 ft RA
- The TCAS is not failed (i.e. the ECAM did not trigger NAV TCAS FAULT)
- TCAS is in TA/RA mode
- At least one AP, or one FD is available
- The AP/FD TCAS mode is not failed (i.e. the ECAM did not trigger the AUTO FLT TCAS MODE FAULT alert)
- EGPWS, WINDSHEAR, or STALL warning is not triggered.

To arm or engage, the AP/FD TCAS mode must be available.

ARMING CONDITIONS

Ident.: DSC-22_30-40-100-00022908.0001001 / 18 MAY 22
Applicable to: LV-KAN, LV-KAO

The AP/FD TCAS mode arms, when a TA alert is triggered.
The AP/FD TCAS mode arms, even if both APs, and both FDs are disengaged. In this case, the APs and FDs remain disengaged.

Note: *The arming of the AP/FD TCAS mode is inhibited when one of the following is applicable:*
- *The TA ONLY mode of the TCAS is selected, or*
- *The STANDBY mode of the TCAS is selected.*

DISARMING CONDITIONS

Ident.: DSC-22_30-40-100-00022928.0001001 / 18 MAY 22
Applicable to: LV-KAN, LV-KAO

The AP/FD TCAS mode disarms, when one of the following occurs:
- The intruder becomes white on the ND, or
- The AP/FD TCAS mode engages upon a RA alert, or
- The TA ONLY mode of the TCAS is selected, or
- The STANDBY mode of the TCAS is selected, or
- The AP/FD TCAS mode fails (i.e the ECAM triggers the AUTO FLT TCAS MODE FAULT alert).

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-100-00022930.0001001 / 18 MAY 22
Applicable to: LV-KAN, LV-KAO

The AP/FD TCAS mode engages, when a RA is triggered.
The AP/FD TCAS mode engages, even if both APs, and both FDs are disengaged. In this case, the FDs automatically engage.

Note:
- *When the AP/FD TCAS mode engages, the triple click audio indicator does not sound, and the FD pitch bar does not flash.*
- *The engagement of the AP/FD TCAS mode is inhibited when one of the following is applicable:*
  - *The TA ONLY mode of the TCAS is selected, or*
  - *The STANDBY mode of the TCAS is selected.*

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-100-00022931.0001001 / 18 MAY 22
Applicable to: LV-KAN, LV-KAO

The AP/FD TCAS mode automatically disengages, when the "CLEAR OF CONFLICT" aural alert sounds.
Then the AP/FD engages in a vertical mode that leads the aircraft toward the target altitude set on the FCU.

The AP/FD TCAS mode also automatically disengages, if one of the following occurs:
- The TA ONLY mode of the TCAS is selected.
  The FMA then displays the TCAS RA INHIBITED message on Line 3 of the "Special Messages" column
- The STANDBY mode of the TCAS is selected.
  The FMA then displays the TCAS RA INHIBITED message on Line 3 of the "Special Messages" column

- The ECAM triggers the AP/FD AUTO FLT TCAS MODE FAULT alert, or
- The flight crew engages another AP/FD vertical mode (e.g. in the case of go-around).

Note: If the AP/FD TCAS mode is lost while engaged, the vertical mode reverts to V/S. The vertical speed target is:
- *0 ft/min if the RA order was to descend*
- *The TCAS vertical speed target at the time of the failure, if the RA order was to climb.*

NORMAL OPERATIONS - WHEN A TA IS TRIGGERED

Ident.: DSC-22_30-40-100-00022932.0001001 / 18 MAY 22
Applicable to: LV-KAN, LV-KAO

When a TA alert is triggered, the AP/FD TCAS mode arms.

CONSEQUENCE ON AP AND FD

When the AP/FD TCAS mode arms, the AP and FDs engagement status does not change.

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode arms, any engaged (armed) AP/FD lateral mode remains engaged (armed).

CONSEQUENCE ON AP/FD VERTICAL MODE

When the AP/FD TCAS mode arms, any armed (engaged) AP/FD vertical mode remains armed (engaged).
The FMA displays TCAS on Line 3 of the "AP/FD Vertical Modes" column. Therefore, if another AP/FD vertical mode is armed, the FMA displays both modes.

NORMAL OPERATIONS - WHEN A RA IS TRIGGERED

Applicable to: LV-KAN, LV-KAO

Ident.: DSC-22_30-40-100-A-00022933.0001001 / 18 MAY 22

At occurrence of any preventive or corrective RA, the AP/FD TCAS mode engages. It provides vertical guidance in accordance with the TCAS vertical speed orders.

Ident.: DSC-22_30-40-100-A-00025020.0001001 / 18 MAY 22

CONSEQUENCE ON AP AND FD

When the AP/FD TCAS mode engages:
- The AP engagement status does not change
- If not previously engaged, the FDs automatically engage.

Ident.: DSC-22_30-40-100-A-00025021.0001001 / 18 MAY 22

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode engages, any engaged (armed) AP/FD lateral mode remains engaged (armed).
If both APs and both FDs are disengaged, when the AP/FD TCAS mode engages, HDG automatically engages. The heading target is the aircraft heading at HDG engagement.

Note: *When the AP/FD TCAS mode disengages (e.g. at the CLEAR OF CONFLICT), the FMA displays the TRK FPA DESELECTED message for 10 s on Line 3 of the "Special Messages" column, if the flying reference was TRK-FPA before the AP/FD TCAS mode engagement.*

Ident.: DSC-22_30-40-100-A-00025022.0001001 / 18 MAY 22

CONSEQUENCE ON AP/FD VERTICAL MODE

GUIDANCE

Depending on the RA and the FCU selected altitude, the AP/FD TCAS mode uses the guidance law of one of the following modes: V/S, ALT*, ALT, ALT CRZ*, ALT CRZ.

V/S Guidance

The AP/FD TCAS mode uses the guidance law of the V/S mode if:

- ALT / ALT CRZ is not armed, or
- The FCU selected altitude of ALT*, ALT, ALT CRZ* or ALT CRZ is not compatible with the RA order.

The vertical speed target is one of the following values:

- The aircraft vertical speed at the engagement of the AP/FD TCAS mode, if a preventive RA is triggered, or
- The limit between the green and red area of the vertical speed scale, ± 200 ft/min if the aircraft should climb (descend).

L2 The AP/FD TCAS mode ensures that the aircraft speed remains between VLS - 5 kt (VLS - 2 kt in landing configuration) and VMAX.

L1 *Note:* *In order to ensure a rapid response to the RA, the initial vertical speed may temporarily exceed the vertical speed target of the TCAS. The peak of the vertical speed is reached in less than 5 s after the vertical speed enters the TCAS green area.*

If the RA order changes, the AP/FD TCAS mode follows the new target.

ALT*, ALT, ALT CRZ* or ALT CRZ Guidance

The AP/FD TCAS mode uses the guidance law of the ALT / ALT CRZ / ALT* / ALT CRZ* mode if:

- ALT / ALT CRZ is armed, and
- The FCU selected altitude of ALT*, ALT, ALT CRZ* or ALT CRZ is compatible with the RA order.

Ident.: DSC-22_30-40-100-A-00025024.0001001 / 18 MAY 22

AP/FD VERTICAL MODE ENGAGED AT OCCURRENCE OF THE RA

When the AP/FD TCAS mode engages, any engaged AP/FD vertical mode disengages.

Note:
- *If G/S / F-G/S ◁ is engaged, when the AP/FD TCAS mode engages:*
  - *G/S / F-G/S ◁ disengages*
  - *LOC / F-LOC ◁ remains engaged*
  - *The APPR pb comes off, and the LOC pb comes on.*
- *If FINAL APP is engaged , when the AP/FD TCAS mode engages:*
  - *FINAL APP disengages*
  - *Managed lateral guidance remains engaged with NAV engaged*
  - *The APPR pb comes off.*

Ident.: DSC-22_30-40-100-A-00025025.0001001 / 18 MAY 22

AP/FD VERTICAL MODE ARMED AT OCCURRENCE OF THE RA

When the AP/FD TCAS mode engages, any armed AP/FD vertical mode disarms, except ALT / ALT CRZ if the altitude capture is compatible with the RA order.

Note:
- *If G/S / F-G/S ◁ is armed, when the AP/FD TCAS mode engages:*
  - *G/S / F-G/S ◁ disarms*
  - *The APPR pb comes off, and the LOC pb comes on.*
- *If FINAL is armed , when the AP/FD TCAS mode engages:*
  - *FINAL disarms*
  - *Managed lateral guidance remains engaged with NAV engaged*
  - *The APPR pb comes off.*

Note: *If the approach is re-armed and if the capture conditions are fulfilled, the corresponding approach mode engages. The AP/FD TCAS mode disengages (even if it is not CLEAR OF CONFLICT). A RA may be triggered again.*

CAPTURE OF THE SELECTED ALTITUDE IN AP/FD TCAS MODE

If ALT / ALT CRZ is armed, when the AP/FD TCAS mode engages:

- ALT / ALT CRZ remains armed if the capture of the FCU selected altitude is compatible with the RA order, and if the selected level is reached before the CLEAR OF CONFLICT.
  L2 If ALT / ALT CRZ is armed, and ALT capture conditions occur during the RA, the AP/FD TCAS mode captures the FCU selected altitude (without ALT* indicated on the FMA).
  This can occur when the TCAS triggers a preventive RA "MONITOR VERTICAL SPEED", or a corrective RA "ADJUST VERTICAL SPEED, ADJUST" aural alert.
  However, if the vertical speed order of the RA is zero, ALT / ALT CRZ disarms.
- L1 ALT / ALT CRZ disarms, if the capture of the FCU selected altitude is not compatible with the RA order.

WHITE BOX ON FMA

When a vertical mode disarms at AP/FD TCAS mode engagement, the FMA displays a white box for 10 s.

Ident.: DSC-22_30-40-100-A-00025026.0001001 / 18 MAY 22

CONSEQUENCE ON A/THR AND SPEED/MACH CONTROL

When the AP/FD TCAS mode engages:

- If the A/THR is disconnected, it becomes armed or active, depending on the thrust lever position
- If the A/THR is armed, it remains armed
- If the A/THR is active, it remains active.

A/THR ACTIVE

When the AP/FD TCAS mode engages, if the A/THR becomes / remains active, the SPEED/MACH mode engages.
The speed/Mach control becomes selected, and the speed/Mach target becomes the aircraft speed/Mach at the occurrence of the RA.
L2 If a new RA order occurs, the speed/Mach target changes, and becomes the aircraft speed/Mach at the occurrence of the new RA.

L1 A/THR ARMED

When the AP/FD TCAS mode engages, if the A/THR becomes / remains armed, the thrust target does not change.
The FMA displays the A/THR message, in accordance with the thrust lever position (e.g. MAN THR, MAN TOGA).

L2 *Note:* *If the flight crew sets the thrust levers to the CL detent, the A/THR activates. The SPEED/MACH mode engages. The speed/Mach control becomes selected, and the speed/Mach target becomes the aircraft speed/Mach at the A/THR activation.*

L1 LVR CLB Message on the FMA

In the case of AP/FD TCAS mode engagement when the A/THR is armed (e.g. RA order triggers below the THR RED ALT):
- If the vertical speed order of the RA is above 500 ft/min, the LVR CLB message is inhibited.
  However, if the speed becomes greater than VFE - 20 kt, the LVR CLB message flashes on the FMA.
- If the vertical speed order of the RA is equal to, or below 500 ft/min, the LVR CLB message flashes on the FMA even when below the THR RED ALT.

Ident.: DSC-22_30-40-100-A-00025027.0001001 / 18 MAY 22

CONSEQUENCE ON ALPHA FLOOR

When AP/FD TCAS mode is engaged, ALPHA FLOOR is temporarily inhibited:
- If all thrust levers are set to CLB detent when the RA is triggered, ALPHA FLOOR is inhibited while AP/FD TCAS mode is engaged.
- If at least one thrust lever is below the CLB detent when the RA is triggered, LVR CLB flashes on the FMA and ALPHA FLOOR is inhibited during 5 s, then:
  - If all thrust levers are set to the CLB detent, ALPHA FLOOR inhibition is maintained while AP/FD TCAS mode is engaged.
  - If at least one thrust lever remains below the CLB detent, ALPHA FLOOR is reactivated.

NORMAL OPERATIONS - WHEN CLEAR OF CONFLICT

Ident.: DSC-22_30-40-100-00025232.0001001 / 18 MAY 22
Applicable to: LV-KAN, LV-KAO

When the "CLEAR OF CONFLICT" aural alert sounds, the AP/FD TCAS mode automatically disengages. The AP/FD provides guidance toward the previous FCU selected altitude.

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode disengages, any engaged / armed AP/FD lateral mode remains engaged / armed.

CONSEQUENCE ON AP/FD VERTICAL MODE

When the AP/FD TCAS mode disengages, one of the following modes engages: V/S, ALT*, ALT, ALT CRZ*, or ALT CRZ.

AP/FD TCAS MODE REVERSION TO ALT / ALT CRZ / ALT* / ALT CRZ*

If ALT / ALT CRZ is armed, when the AP/FD TCAS mode disengages:

- ALT* / ALT CRZ* engages, if the aircraft is within the capture zone of the FCU selected altitude
- ALT / ALT CRZ engages, if the aircraft altitude is equal to the FCU selected altitude
- In all other cases, V/S engages.

AP/FD TCAS MODE REVERSION TO V/S

When the AP/FD TCAS mode reverts to V/S when clear of conflict, all of the following occurs:

- ALT or ALT CRZ arms
- A triple click audio indicator sounds, and the pitch bar flashes for 10 s
- The vertical speed target depends on whether a preventive RA occurred, or a corrective RA occurred.

Vertical Speed Target - A Preventive RA Occurred

The vertical speed target remains the vertical speed target at the triggering of the RA.

Vertical Speed Target - A Corrective RA Occurred

The vertical speed target becomes:

- 500 ft/min, if the aircraft is at, or above 30 000 ft, and the FCU selected altitude is above the aircraft
- ±1 000 ft/min, in all other cases.
  V/S leads the aircraft toward the FCU selected altitude.

AP/FD MODE REVERSIONS

Ident.: DSC-22_30-40-110-A-00025005.0001001 / 18 MAY 22
Applicable to: ALL

REVERSION DUE TO FCU ALTITUDE CHANGES

Conditions	Event	Consequence

REVERSION DUE TO THE LOSS OF NAV MODE

Conditions	Event	Consequence
CLB engaged	Loss of lateral managed mode: NAV	OP CLB engages
DES engaged		V/S engages. (*Refer to DSC-22_30-40-70 Reversions to V/S / FPA*)

Ident.: DSC-22_30-40-110-A-00025007.0001001 / 18 MAY 22
Applicable to: ALL

SPEED PROTECTION WHEN FD ORDERS ARE NOT FOLLOWED BY THE FLIGHT CREW (AP NOT ENGAGED)

Conditions	Event	Consequence
FD engaged with: - AP OFF, and - OP DES or DES engaged, and - A/THR active (IDLE thrust).	IAS = VLS-2 kt (between VLS-2 kt and VLS-19 kt depending on the position of the speedbrakes)	FD bars disappear. If A/THR active, automatic engagement of SPEED mode on the A/THR. Thrust increases to recover the speed target.
FD is engaged with: - AP off, and - OP CLB or CLB engaged, and - A/THR active (CLIMB thrust).	IAS = VMAX+4 kt	FD bars disappear. If A/THR active, automatic engagement of SPEED mode on the A/THR. Thrust decreases to recover the speed target.

Ident.: DSC-22_30-40-110-A-00025008.0002001 / 18 MAY 22
Applicable to: ALL

SPEED PROTECTION DUE TO EXCESSIVE V/S

Conditions	Event	Consequence
Excessive V/S or FPA selected in climb	IAS = VLS (or VLS-5 kt if target is VLS)	The selected V/S (or FPA) target is temporarily disregarded to maintain VLS in climb, or VMAX in descent.
Excessive V/S or FPA selected in descent	IAS = VMAX	

Note: *When flying with FD bars only (AP OFF), the FMGES adjusts the pitch so that VLS in climb, or VMAX in descent is maintained. However, no triple click is generated and the V/S target displayed on the FMA remains unchanged.*

Ident.: DSC-22_30-40-110-A-00025009.0001001 / 18 MAY 22
Applicable to: LV-KAN, LV-KAO

SPEED PROTECTION DUE TO EXCESSIVE V/S TARGET (AP/FD TCAS MODE ENGAGED)

Conditions	Event	Consequence
Excessive V/S target in climb	IAS reaching VLS (or VLS - 5 kt if target is VLS or VLS - 2 kt if target is VLS in landing configuration)	The TCAS RA V/S target is temporarily disregarded to maintain VLS in climb, or VMAX in descent.
Excessive V/S target in descent	IAS reaching VMAX	

Note: *When flying with FD bars only (AP OFF), the FMGES adjusts the pitch so that VLS in climb, or VMAX in descent is maintained. However, no triple click is generated and the V/S target displayed on the FMA remains unchanged.*

Takeoff

TAKEOFF WITH NAV

Ident.: DSC-22_30-40-120-20-00025712.0001001 / 18 MAY 22
Applicable to: ALL

NAV and CLB arm when the aircraft is on ground, and:

- The FDs are engaged
- A runway and a SID are selected in the flight plan
- V2 is inserted in the PERF TAKEOFF page
- No FLX TO temperature, nor DRT TO level (Derated Takeoff ◁) is entered in the PERF TAKEOFF page
- The FCU selected altitude is set above the acceleration altitude
- The slats are extended.

When the aircraft is at the runway threshold, and the flight crew sets the thrust levers to TOGA, SRS and RWY engage, and MAN TOGA appears on the FMA.
At least 5 s after liftoff, the flight crew can engage one AP.
At 30 ft RA, RWY disengages, and NAV engages.
When the aircraft reaches the thrust reduction altitude, LVR CLB flashes. The flight crew sets the thrust levers to the CL detent, MAN TOGA disappears, and THR CLB engages.
At the acceleration altitude, SRS disengages, and CLB engages.
From liftoff to the acceleration altitude, the managed speed target is V2+10 kt. At the acceleration altitude, the managed speed target becomes the applicable FMS speed target (e.g. CLB SPD LIM, ECON speed).

TAKEOFF WITH HDG/TRK PRESET

Ident.: DSC-22_30-40-120-20-00025713.0001001 / 04 MAY 23
Applicable to: ALL

OP CLB arms when the aircraft is on ground, and:
- The FDs are engaged
- A runway is selected in the flight plan
- V2 is inserted in the PERF TAKE OFF page
- No FLX TO temperature, nor DRT TO level (Derated Takeoff ⪡) is entered in the PERF TAKEOFF page
- The FCU selected altitude is set above the acceleration altitude

- The flight crew turned the HDG/TRK knob on the FCU to select a heading (or track) preset The HDG/TRK window displays the heading (or track). The display remains, as long as RWY, RWY TRK, and HDG (or TRACK) are engaged.
- The slats are extended.

When the aircraft is at the runway threshold, and the flight crew sets the thrust levers to TOGA, SRS and RWY engage, and MAN TOGA appears on the FMA.
At least 5 s after liftoff, the flight crew can engage one AP.
At 30 ft RA, RWY disengages, and RWY TRK engages.
When the flight crew pulls the HDG/TRK knob, HDG engages (HDG-V/S is selected).
At the thrust reduction altitude, THR CLB engages.
At the acceleration altitude, OP CLB engages.
From liftoff to the acceleration altitude, the managed speed target is V2+10 kt. At the acceleration altitude, the managed speed target becomes the applicable FMS speed target (e.g. CLB SPD LIM, ECON speed).

GENERAL

Ident.: DSC-22_30-50-10-00025044.0001001 / 18 MAY 22
Applicable to: ALL

The A/THR manages the engine thrust.
The A/THR is either armed, active or disconnected.

When active, two different types of A/THR modes are available:
- The SPEED/MACH mode:
  The A/THR continuously adjusts the thrust in order to maintain a speed/Mach target (e.g. during cruise, and approach).
- The THRUST modes:
  The A/THR controls a fixed thrust, in accordance with the engaged THRUST mode.

The A/THR modes are automatically linked to the AP/FD vertical modes:
- When an AP/FD vertical mode controls the trajectory (e.g. altitude acquire modes, altitude hold modes, V/S / FPA, G/S, F-G/S ◁), the A/THR is in SPEED/MACH mode
- When an AP/FD vertical mode adjusts the aircraft pitch in order to maintain a speed/Mach target (e.g. climb, descent), the A/THR is in THRUST mode.

When the A/THR is active, the A/THR thrust target is sent to the FADECs. The FADECs computes thrust commands, in accordance with the aircraft environment and status. The thrust commands are then sent to the engines.
When the A/THR is armed, the FADECs compute the thrust commands in accordance with the thrust lever positions, and the selection of PERF TAKEOFF page.
When the A/THR is disconnected, the FADECs compute the thrust commands in accordance with the thrust lever positions.

A/THR ARCHITECTURE

Ident.: DSC-22_30-50-10-00025045.0001001 / 18 MAY 22
Applicable to: ALL

The FMGECs independently compute the A/THR commands and only one FMGEC controls the active A/THR, referred to as the master FMGEC.
If one AP is engaged, the A/THR uses the system data associated to the engaged AP. If no AP/FD is engaged or both APs are engaged, FMGEC1 has the priority.

Intentionally left blank

THRUST LEVERS

Ident.: DSC-22_30-50-20-00025046.0001001 / 18 MAY 22
Applicable to: ALL

The position of the thrust levers determines the A/THR status: active, armed or disconnected.

The thrust levers have:
- Four detents: IDLE, CL, FLX-MCT, TOGA
- Two instinctive disconnect pushbuttons.

The flight crew uses the thrust levers to:
- Arm, activate, or disconnect the A/THR
- Engage the takeoff and go-around modes
- Manually control the thrust of each engine, when the A/THR is disconnected
- Engage reverse thrust.

Intentionally left blank

PRELIMINARY CONDITIONS REQUIRED FOR A/THR ARMING AND ACTIVATION

Ident.: DSC-22_30-50-30-A-00025047.0001001 / 18 MAY 22
Applicable to: ALL

A/THR can only arm when all of the following are applicable:
- At least one FMGEC is available, and
- At least one FCU channel is available, and
- Two ADIRUs are available, and
- The A/THR is not manually disabled (Instinctive Disconnect pb has not been pressed for more than 15 s), and

Ident.: DSC-22_30-50-30-A-00025061.0001001 / 18 MAY 22
Applicable to: LV-KHT, LV-KHU

- All the engines are operative in the same rating mode: EPR or N1, and
- A maximum of one engine is operative in N1 degraded mode, and

Ident.: DSC-22_30-50-30-A-00025060.0001001 / 18 MAY 22
Applicable to: ALL

- Two FADECs are operative.

A/THR ARMING

Applicable to: ALL

Ident.: DSC-22_30-50-30-B-00025049.0001001 / 18 MAY 22

ARMING CONDITIONS

The A/THR arms, if one of the following occurs:
- At takeoff, the flight crew sets at least one thrust lever:
  - To the TOGA detent, or
  - To the FLX-MCT detent, when a FLX TO temperature or a DRT TO level (Derated Takeoff ◁) is entered in the PERF TAKEOFF page.

  SRS TO engages
- By engaging a go-around (MAN TOGA), the flight crew sets the thrust levers to the TOGA detent: SRS GA engages
- By engaging a Soft Go-Around ◁ (MAN GA SOFT), the flight crew sets the thrust levers to the TOGA detent, then to the FLX/MCT detent: SRS GA engages

- The flight crew presses the A/THR pb on the FCU, when the A/THR is disconnected, provided that all the following occur:
  - The thrust levers are outside of the A/THR active range:
    - ■ Above CL detent (AEO), or
    - ■ Above FLX-MCT detent (OEI).
  - The aircraft is above 100 ft RA, or all RAs are failed
  - LAND or FLARE is not engaged.
- AP/FD TCAS ◁ engages due to a RA, when the A/THR is disconnected and the thrust levers are outside of the A/THR active range.

In addition, A/THR can be armed by a flight crew action on the thrust levers, when the A/THR is active.

Ident.: DSC-22_30-50-30-B-00025050.0001001 / 18 MAY 22

ANNUNCIATION

When the A/THR is armed:

- The A/THR pb light of the FCU is on
- The FMA displays:
  - A/THR on Line 3 of the "AP, FD, and A/THR Engagement Status" column
  - One of the following A/THR modes in the "A/THR messages and modes" column: MAN TOGA, MAN FLX +XX, MAN DTO (Derated Takeoff ◁), MAN GA SOFT ◁ , MAN MCT, or MAN THR

As long as the A/THR is not active, the A/THR messages on the FMA displays the manual thrust as follows:

Conditions		Thrust lever position	FMA Message(1)
From takeoff, and until the thrust reduction altitude	The flight crew performs a takeoff with no FLX TO temperature, or DRT TO level (Derated Takeoff ◁) entered in the PERF TAKEOFF page	TOGA (2) (3)	MAN TOGA
	The flight crew entered a FLX TO temperature in the PERF TAKEOFF page	FLX-MCT (3)	MAN FLX +XX
	The flight crew entered a DRT TO level (Derated Takeoff ◁) in the PERF TAKEOFF page	FLX-MCT (3)	MAN DTO

Continued on the following page

Continued from the previous page

Conditions		Thrust lever position	FMA Message(1)
In descent, or approach	The flight crew performs a go-around	TOGA (3) (4)	MAN TOGA
	The flight crew performs a soft go-around ◁✱	TOGA then FLX-MCT (3) (4)	MAN GA SOFT

(1) *The FMA message appears in a white box, on Line 1 and 2 of the "A/THR messages and modes" column.*

(2) *If the flight crew sets the thrust levers to FLX-MCT, MAN MCT will appear on FMA.*

(3) *If the flight crew sets the thrust levers between CL and TOGA, but not at the CL, FLX-MCT, or TOGA detent, MAN THR will appear on FMA.*

(4) *If the flight crew sets the thrust levers directly to FLX-MCT and not TOGA then FLX-MCT, the MAN THR will appear on the FMA.*

A/THR ACTIVATION

Applicable to: ALL

Ident.: DSC-22_30-50-30-C-00025051.0001001 / 18 MAY 22

GENERAL

When active, the A/THR controls:
- The thrust, when an A/THR THRUST mode is engaged, or
- The speed/Mach, when the A/THR SPEED/MACH mode is engaged.

The thrust lever positions determine the maximum thrust that the A/THR can command (except in A.FLOOR).

The normal position of the thrust levers is with A/THR active is:
- The CL detent (AEO)
- The FLX-MCT detent for the operative engine (OEI).

Note: *The thrust lever of a failed engine should be in the IDLE detent.*

Ident.: DSC-22_30-50-30-C-00025052.0001001 / 18 MAY 22

ACTIVATION CONDITIONS

The A/THR activates, if one of the following occurs:

- The A/THR is armed, and the flight crew sets the thrust levers in the active range:

L12

Engine Condition	Active Range
AEO	Both thrust levers are above idle, and at or below the CL detent. The A/THR also activates when: - One thrust lever is above the idle detent, and at or below the CL detent, and - The other thrust lever is • At the idle detent, or • Above the CL detent, and at or below the FLX-MCT detent. Note: *In the case of takeoff with a FLX TO temperature or a DRT TO level (Derated Takeoff ◁) entered in the PERF TAKEOFF page, the thrust lever must be below the FLX-MCT detent.*
OEI(1)	One thrust levers is above the idle detent, and at or below FLX-MCT detent. If the engine-out occurs during a FLX TO or a DRT TO (Derated Takeoff ◁), the flight crew activates the A/THR by: 1. Setting the thrust lever of the operative engine below FLX-MCT, 2. Then, settings the thrust lever of the operative engines back to FLX-MCT.

(1) The thrust lever of the failed engine should be at the idle detent.

- The flight crew presses the A/THR pb on the FCU when the A/THR is disconnected, provided that:
  - The thrust levers are in the active range
  - L2 The aircraft is above 100 ft RA, or all RAs are failed
  - LAND or FLARE is not engaged.
- L1 A.FLOOR engages

  Note: *A.FLOOR engages regardless of the initial A/THR status, and the position of the thrust levers.*

- AP/FD TCAS ◁ engages, upon a RA, when the A/THR is disconnected and the thrust levers are in the active range.

Ident.: DSC-22_30-50-30-C-00025053.0001001 / 18 MAY 22

ANNUNCIATION

When the A/THR is active:

- The A/THR pb light is illuminated on the FCU
- The EWD displays the thrust target
- The FMA displays:
  - A/THR on Line 3 of the "AP, FD, and A/THR Engagement Status" column
  - A/THR mode on Line 1 of the "A/THR messages and modes" column.

Ident.: DSC-22_30-50-30-C-00025054.0001001 / 18 MAY 22

EFFECT OF THRUST LEVER MOVEMENT WHEN THE A/THR IS ACTIVE

A/THR TRANSITION FROM ACTIVE TO ARMED

When the A/THR is active, the A/THR becomes armed as described in the following table:

L12

Engine Condition	Thrust Lever Position
AEO	All the thrust levers are above the CL detent. Or at least one thrust lever is above the FLX-MCT detent.
OEI	The thrust lever of the operative engine is above the FLX-MCT detent.

When the A/THR becomes armed, the thrust immediately increases in accordance with the thrust lever position (above CL detent (AEO) or above FLX-MCT detent (OEI)).
The FMA displays MAN THR on Line 1 of the "A/THR Modes and Messages" column.

A/THR LIMITED

The A/THR limits the engine thrust at the thrust levers position when:

- All the thrust levers are set below the CL detent (AEO), or
- The thrust lever of all operative engines are set below FLX-MCT detent (OEI).

When the thrust is limited, the AUTO FLT A/THR LIMITED alert triggers.
L2 The AUTO FLT A/THR LIMITED alert is repeated every 5 s, until the flight crew moves the thrust levers to the CL detent (AEO) or FLX-MCT detent (OEI).
L1 The FMA displays THR LVR on Line 1 of the "A/THR Modes and Messages" column.
LVR CLB or LVR MCT flashes on Line 3 of the "A/THR Modes and Messages" column of the FMA.
This reminds the flight crew that the normal position of the thrust levers, when A/THR is active, is the CL detent (AEO) or the FLX-MCT detent (OEI).

L2 LVR CLB flashes on the FMA, when all the following conditions are applicable:
- All engines are operative (AEO)
- The position of the thrust levers are not appropriate:
  - Both thrust levers are below the CL detent, or
  - One thrust lever is above CL detent.
- The aircraft is above 100 ft RA
- No windshear is detected.

LVR MCT flashes on the FMA, when all the following conditions are applicable:
- One engine is inoperative (OEI)
- The position of the thrust lever of the operative engines is not appropriate:
  - The thrust lever is below the FLX-MCT detent, or
  - The aircraft is above the thrust reduction altitude, and the thrust lever is above FLX-MCT.
- The aircraft is above 100 ft RA
- No windshear is detected.

L1 ASYMMETRIC THRUST LEVERS

LVR ASYM flashes on the FMA if all the following conditions are satisfied:
- The A/THR is armed or active, and
- At least one thrust lever is set to CL detent or FLX-MCT detent , and
- One thrust lever is not in the same position, and
- L2 The aircraft is above 100 ft RA.

L1 *Note:* ***LVR ASYM*** *flashes until the flight crew sets all thrust levers to the CL detent or the FLX-MCT detent.*
LVR ASYM *will not be displayed in the case of OEI or if the flight crew sets one thrust lever to the IDLE detent.*

A/THR DISCONNECTION

Applicable to: ALL

Ident.: DSC-22_30-50-40-A-00025055.0001001 / 18 MAY 22

GENERAL

STANDARD DISCONNECTION

The A/THR disconnects if one of the following occurs:

- The flight crew presses an A/THR instinctive disconnect pb, or

  Note: *In normal operation, if the flight crew presses the A/THR instinctive disconnect pb, the engine thrust target is set to the thrust lever position.*

- The flight crew sets all the thrust levers to the IDLE detent.

NON-STANDARD DISCONNECTION

The A/THR disconnects if one of the following occurs:

- The flight crew presses the A/THR pb on the FCU.
- The A/THR becomes inoperative.

L2 One of the preliminary conditions required for A/THR arming or activation is no longer applicable. .

L1 L2 For more information on how to the set the autothrust to off, *Refer to FCTM/AS-FG-10-2 To set Autothrust to Off*.

L1

CAUTION	If the flight crew presses, and holds one A/THR instinctive disconnect pb for more than 15 s, the A/THR will disconnect for the remainder of the flight. All A/THR modes, including A.FLOOR, will be lost. The A/THR will be recovered at the next FMGEC power-up on the ground.

Ident.: DSC-22_30-50-40-A-00025056.0001001 / 18 MAY 22

THRUST LOCK FUNCTION

The thrust lock function activates if an A/THR non-standard disconnection occurs.

As long as the thrust lock function is active, all the following are applicable:

- The engines maintain the thrust at the value set before the A/THR disconnection
- The FMA displays the flashing THR LK message on Line 3of the "A/THR modes and Messages" column
- The ECAM alert ENG THRUST LOCKED appears every 5 s.

The thrust lock deactivates as soon as the flight crew moves the thrust levers.

A/THR ANNUNCIATION AND WARNINGS

Applicable to: ALL

Ident.: DSC-22_30-50-40-B-00025057.0001001 / 03 NOV 23

STANDARD DISCONNECTION

In the case of a standard disconnection (*Refer to DSC-22_30-50-40 A/THR Disconnection*), all the following occur:

- The Memo amber message A/THR OFF appears
  L2 The maximum duration is 9 s
- L1 The MASTER CAUT light comes on
  L2 The maximum duration is 3 s
- L1 The single chime sounds.

The flight crew can press the A/THR instinctive disconnect pb, or the MASTER CAUT light to clear all the associated indicators.

Note: *If the aircraft is below 50 ft RA, and the flight crew sets all thrust levers to IDLE, no alert appears.*

Ident.: DSC-22_30-50-40-B-00025058.0001001 / 18 MAY 22

NON-STANDARD DISCONNECTION

In the case of a non-standard disconnection (*Refer to DSC-22_30-50-40 A/THR Disconnection*), all the following occur:

- The AUTO FLT A/THR OFF alert appears
- The MASTER CAUT light comes on
- The single chime sounds.

The alerts disappear if the flight crew:

- Presses the A/THR instinctive disconnect pb, or
- Presses the MASTER CAUT pb, or
- Arms or activates the A/THR.

GENERAL

Ident.: DSC-22_30-50-50-00025059.0001001 / 18 MAY 22
Applicable to: ALL

When the A/THR is active, an A/THR mode is engaged.
The A/THR modes are: THRUST, SPEED/MACH, RETARD and ALPHA FLOOR.

THRUST MODE

Ident.: DSC-22_30-50-50-00025065.0001001 / 18 MAY 22
Applicable to: ALL

The A/THR is in THRUST mode if the engaged vertical AP/FD modes is SRS TO, OP CLB, CLB, OP DES, DES, or SRS GA in idle path. The target thrust depends on the engaged THRUST mode and can be limited by the thrust lever position, if the thrust levers are below the CL detent (AEO) or the FLX-MCT detent (OEI).
The following table shows the engagement conditions of the THRUST mode with the associated target thrust :

THRUST mode (Displayed on FMA)	Engagement Conditions (1)	Target Thrust
THR CLB	All of the following conditions are applicable: - SRS TO, CLB, OP CLB, or SRS GA is engaged, and - The most forward thrust lever is set to CL detent, and - The derated CLB is not selected on the FMS PERF TAKEOFF page.	CLB
THR DCLB 1(2) ◁	All of the following conditions are applicable: - SRS TO, CLB, OP CLB, or SRS GA is engaged, and - The most forward thrust lever is set to CL detent, and - The derated CLB is selected on the FMS PERF TAKEOFF page.	Derated Climb ◁
THR MCT	All of the following conditions are applicable: - SRS TO, CLB, OP CLB, or SRS GA is engaged, and - The most forward thrust lever is set to MCT detent, and - One engine is inoperative.	MCT
THR IDLE	DES, OP DES, or the A/THR RETARD mode is engaged.	IDLE

Continued on the following page

Continued from the previous page

THRUST mode (Displayed on FMA)	Engagement Conditions [(1)]	Target Thrust
THR DES	All of the following conditions are applicable: - DES is engaged in idle path, and - The FMS requests a thrust slightly higher than the idle thrust.	Slightly higher than IDLE
THR LVR	One of the following conditions is applicable: - All thrust levers are below CL detent, and SRS TO, CLB, OP CLB, or SRS GA is engaged, or - The most forward thrust lever is between CL and MCT detents, and SRS TO, CLB, OP CLB, or SRS GA is engaged	Thrust corresponding to thrust levers position

(1) *The thrust lever position refers to the thrust lever of operative engines. The thrust lever of an inoperative engine should be at the IDLE detent.*

SPEED/MACH MODE

Applicable to: ALL

Ident.: DSC-22_30-50-50-A-00025066.0001001 / 18 MAY 22

The SPEED or MACH mode of the A/THR adjusts the thrust to acquire and maintain a target speed or Mach.

The A/THR is in SPEED or MACH mode if one of the following AP/FD vertical modes is engaged:
- V/S / FPA, or
- Altitude capture and hold modes: ALT*, ALT, ALT CST*, ALT CST, ALT CRZ*, ALT CRZ, or
- DES in geometric path, or
- Approach modes: G/S*, G/S, F-G/S* ◁ , F-G/S ◁ , FINAL APP, or
- AP/FD TCAS ◁ .

If all APs and all FDs are disengaged and the A/THR is active, the A/THR is in SPEED/MACH mode.

Ident.: DSC-22_30-50-50-A-00025067.0001001 / 18 MAY 22

The speed/Mach target is:
- **Selected** if the target comes from the SPD/MACH value that the flight crew selects on the FCU
- **Managed** if the target comes from the FMS.

When in SPEED or MACH mode, the A/THR does not allow speed excursions beyond the following limits, regardless of the target speed or Mach number:
- As a maximum speed VMAX in high lift configuration, VMAX - 5 kt in clean configuration
- As a minimum speed:
  - For a selected speed target, VLS
  - For a managed speed target, the maneuvering speed of the current slats/flaps configuration (VAPP, F, S, GD).

Ident.: DSC-22_30-50-50-A-00025069.0001001 / 18 MAY 22

Note: *The changeover from SPEED to MACH or vice versa can be done automatically by the FMGEC or manually by the flight crew by pressing the SPD/MACH pb on the FCU.*

Ident.: DSC-22_30-50-50-A-00025070.0001001 / 04 MAY 23

A/THR SOFT MODE

FUNCTION

The purpose of the A/THR SOFT Mode is to reduce thrust variations, specifically in light turbulence. This mode permits slight variations of the speed/Mach.

ACTIVATION

The A/THR SOFT Mode activates if all the following conditions are applicable:
- The A/THR is active in SPEED or MACH mode
- The current speed is within a range of ± 3 kt of the target speed
- The AP is engaged in ALT CRZ mode
- The speed brakes are retracted
- All engines are operative
- The Mach target is above 0.65.

Note: *No message indicates that the A/THR soft mode is active.*

DEACTIVATION

The A/THR SOFT Mode deactivates if one of the following conditions is applicable:
- The aircraft speed significantly deviates from the target, or
- The aircraft speed goes above VMAX, or
- The flight crew changes the target speed.

Note: *The transition from A/THR SOFT Mode to A/THR normal mode may lead to transient thrust variations.*

Ident.: DSC-22_30-50-50-A-00025068.0001001 / 18 MAY 22

A/THR APPROACH MODE

Below 150 ft RA, the A/THR behavior is optimized to be less responsive to speed variations. This logic exists to avoid large thrust increases during the lower segment of the approach that may lead to destabilization and possible long flare.

RETARD MODE

Ident.: DSC-22_30-50-50-00025072.0001001 / 18 MAY 22
Applicable to: ALL

The A/THR RETARD mode is only available during an automatic landing.

The RETARD mode engagement occurs as follows:
1. At least one AP is engaged. LAND and A/THR SPEED mode are engaged
2. FLARE engages
3. When the aircraft reaches approximately 50 ft RA, the A/THR RETARD mode automatically engages. The FMA displays THR IDLE and the A/THR sets the thrust to idle
4. A RETARD callout triggers at 10 ft RA, asking the flight crew to set the thrust levers to the IDLE detent
5. The flight crew sets the thrust levers to IDLE detent: The A/THR disconnects, and the RETARD mode disengages.

If the last AP disengages when RETARD is engaged, RETARD disengages, and SPEED engages.

Note: *In manual landing, the RETARD callout triggers at 20 ft RA.*

In manual or automatic landing, the RETARD callout triggers, independently of the thrust levers position (*Refer to DSC-22_30-40-120-80 ILS Approach and Autoland*).

A/THR MODE REVERSIONS

Ident.: DSC-22_30-50-50-00025033.0001001 / 18 MAY 22
Applicable to: ALL

The following table presents the A/THR mode reversions:

Initial A/THR Mode	**A/THR Mode after Reversion**	**Conditions Leading to A/THR Mode Reversion**	**Warning**
THRUST	SPEED/MACH	The aircraft does not follow the speed target: - The aircraft speed is below VLS - 2 kt when DES or OP DES is engaged, or - The aircraft speed is above VMAX + 4 kt when CLB or OP CLB is engaged. *Note:* *If the FD is engaged, the FD also disengages*	A triple click audio indicator sounds. If the aircraft speed goes above VMAX + 4 kt, the OVERSPEED alert triggers.
Whatever A/THR mode. The A/THR can be armed, active, or disconnected.	A.FLOOR	*Refer to DSC-27-20-10-20 Protections - High Angle of Attack Protection*	*Refer to DSC-22_30-50-50 ALPHA FLOOR*

ALPHA FLOOR

Applicable to: ALL

Ident.: DSC-22_30-50-50-B-00025073.0001001 / 18 MAY 22

ALPHA FLOOR avoids flying at low speed with a low thrust. ALPHA FLOOR automatically applies TOGA thrust if the aircraft angle of attack exceeds the ALPHA FLOOR threshold (between αprot and αmax) that depends on the aircraft configuration.
For more information on ALPHA FLOOR threshold, *Refer to DSC-27-20-10-20 Protections - General*.

Note: *A.FLOOR is activated through the autothrust system, when:*

- *α is greater than a threshold depending on the aircraft configuration, the ground speed variation, and the difference between ground speed and air speed, or*
- *Sidestick deflection above 14 ° and the:*
  - *Pitch attitude is greater than 25 °, or*
  - *AOA protection active.*

If A.FLOOR activates, all the following events occur:

1. The A/THR automatically activates, independently of the previous A/THR engagement status
2. The A.FLOOR mode of the A/THR engages
3. The A/THR commands TOGA thrust, regardless of the thrust lever positions
4. The FMA displays A.FLOOR with a flashing amber box on Line 1 of the "A/THR Messages and Modes" column
5. The EWD displays A.FLOOR

If the aircraft leaves the ALPHA FLOOR conditions, the FMA displays TOGA LK with a flashing amber box on the first line of the first column. This indicates that the TOGA thrust is maintained.

CAUTION	The A.FLOOR mode will disconnect, if the flight crew manually disconnects the A/THR.

ALPHA FLOOR is available from the lift-off to 100 ft RA in approach if the A/THR is available.

Ident.: DSC-22_30-50-50-B-00025074.0001001 / 18 MAY 22

ALPHA FLOOR is inhibited if one of the following is applicable:

- A/THR is failed, or
- The aircraft altitude is below 100 ft during landing, or
- The aircraft speed is above M 0.53,or
- One engine is failed with the flaps extended or with Derated Takeoff ◁ selected, or
- AP/FD TCAS ◁ mode engages (*Refer to DSC-22_30-40-100 Normal Operations - When a RA is triggered - Consequence on ALPHA FLOOR*).

Ident.: DSC-22_30-50-50-B-00025075.0001001 / 18 MAY 22

CAUTION	The system may consider an engine as failed if the corresponding Thrust Lever Angle (TLA) is below 5° and another TLA is above 5°. The system may therefore inhibit ALPHA FLOOR. In manual thrust control, the flight crew should check that all the thrust levers are correctly aligned above 5° to avoid an undue inhibition of ALPHA FLOOR.

FROM TAKEOFF TO THRUST REDUCTION ALTITUDE

Ident.: DSC-22_30-50-60-00025743.0001001 / 18 MAY 22
Applicable to: ALL

The aircraft is on ground, and the flight crew performs a takeoff with no selected FLX TO temperature, or DRT TO level (Derated Takeoff ◁) in the PERF TAKEOFF page:

1. The thrust levers are in the IDLE detent
2. The flight crew sets the thrust levers to TOGA:
    - A/THR arms
    - The engines thrust increases to TOGA
    - MAN TOGA appears on the FMA
    - SRS TO engages.
3. When the aircraft reaches the thrust reduction altitude, LVR CLB flashes
4. The flight crew sets the thrust levers to the CL detent:
    - A/THR activates
    - THR CLB appears on the FMA.

GENERAL

Ident.: DSC-22_30-60-10-00019300.0001001 / 18 MAY 22
Applicable to: ALL

The speed/Mach control is:
- Managed, when the target comes from the FMS
- Selected, when the target comes from the SPD/MACH FCU window.

In flight, either the AP/FD pitch control or the A/THR may acquire and hold a target speed or Mach number, according to the engaged modes.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-60-20-00019301.0001001 / 18 MAY 22
Applicable to: ALL

When the speed target is managed, the SPD/MACH window of the FCU shows dashes, and the corresponding dot is lighted. The PFD speed scale shows the speed target in magenta.
For more information on the Speed/Mach Control Area, *Refer to DSC-22_10-40-20 Speed/Mach Control Area*.
For more information on the PFD Airspeed Indications, *Refer to DSC-31-40 Airspeed*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-60-20-00025778.0001001 / 18 MAY 22
Applicable to: ALL

The SPD target is managed whenever AP or FD is engaged and one of the following occurs:
- On ground, when V2 is inserted in the PERF TAKEOFF page, or

  Note: At takeoff, SRS TO will not engage if V2 is not available.

- The SRS TO or SRS GA is engaged, or
- The flight crew pushes the SPD/MACH knob on the FCU, and a managed speed/Mach target is available, or
- The AP/FD TCAS ◁ mode is engaged.

Note:
1. *If all the APs and FDs are off, the managed speed/Mach is only available when the flight phase of the FMS is the approach phase. The A/THR is then in SPEED mode.*
2. *The flight crew may insert a speed/Mach in the PERF DES page to replace the ECON DES SPD.*
   In this case, although the value is entered by the flight crew, this speed target is still managed and is taken into account to compute the top of descent and the descent profile.

MANAGED SPEED/MACH TARGET

Applicable to: ALL

Ident.: DSC-22_30-60-20-A-00025062.0001001 / 18 MAY 22

For managed speed/Mach, the lowest target is VLS, and the highest target is:
- VMAX in the case VMAX is equal to VFE, or
- VMAX - 5 kt in the case VMAX is equal to VMO/MMO.

When speed/Mach is managed, the target is defined as follows:

AP/FD Engaged Mode or FMS Flight Phase	Managed Speed/Mach Target
SRS TO is engaged, and the aircraft is on ground.	V2
SRS TO is engaged, and the aircraft is airborne.	V2 + 10 kt *Note:* *However, the magenta triangle appears on the V2 value, on the PFDs.*
SRS TO is engaged, and one engine is out.	Memorized aircraft speed at engine-out detection. The target value is limited by V2 and V2 + 15 kt.
SRS GA is engaged.	Memorized aircraft speed at SRS GA engagement. The lower limit of the target is the VAPP memorized at 700 ft RA. The higher limit of the target is the lowest value between: - VLS + 25 kt (or VLS + 15 kt OEI) - VMAX - 5 kt.
- The FMS flight phase is the approach phase In this case, the APs and/or FDs may be on or off Or - F-G/S ◁ , G/S, LAND, FLARE or ROLL OUT is engaged	VAPP, corrected by the Ground Speed Mini function (*Refer to DSC-22_30-60-20 Ground Speed Mini Function*). Before reaching the landing configuration, the speed will not go below: - Green Dot, in clean configuration - S, in CONF 1 - F, in CONF 2 - F, in CONF 3, when CONF FULL is the landing configuration (as defined in the PERF APPR page). VAPP is memorized at 700 ft RA, so if the FMS loses the VAPP below 700 ft RA, the managed speed target will still be computed. The lower limit of the managed speed target is the VAPP that is computed by the FMS, and displayed on the MCDU. If the VAPP computed by the FMS is not available, the VAPP is VLS + 5 kt. The higher limit of the managed speed target is the VFE NEXT (or VFE - 5 kt in full configuration) of the landing configuration.
For all other cases	The managed speed/Mach target is provided by the FMS: - If NAV is engaged, the managed speed/Mach target will be defined by the speed/Mach profile of the FMS flight plan. All the speed/Mach constraints are taken into account. - If NAV is not engaged, the managed speed/Mach target will be defined by the speed/Mach profile of the FMS flight plan. But the speed/Mach constraints are not taken into account. For information on the speed/Mach profile, *Refer to DSC-22_20-30-20-05 Flight Phases*.

Ident.: DSC-22_30-60-20-A-00019305.0001001 / 18 MAY 22

MANAGED SPEED TARGET MEMORIZATION

A dual FM failure has different consequences when it occurs in different phases of the flight.

The system handles target speed and SPD mode as follows:
- During approach with LOC and G/S, or F-LOC ◁ and F-G/S ◁ , or LOC and F-G/S ◁ , or LOC B/C and F-G/S ◁ engaged, and radio height <700 ft, the target speed is set to VAPP as previously memorized, and managed SPD target is maintained
- At go-around, the target speed becomes the memorized go-around speed, which is the higher of VAPP or the speed when go-around was initiated. Managed SPD target is maintained
- In all other cases, managed target speed reverts to selected, the value being the speed at the moment of the failure.

GROUND SPEED MINI FUNCTION

Applicable to: ALL

Ident.: DSC-22_30-60-20-B-00019830.0001001 / 18 MAY 22

GENERAL

When the aircraft flies an approach in managed speed, the managed speed target, displayed by the magenta triangle on the PFDs, is variable. This managed speed target is the VAPP, displayed on the PERF APPR page, corrected by the Ground Speed Mini function.

ACTIVATION CONDITIONS

The Ground Speed Mini function is active when:

- The speed is managed
- The FMS flight phase is the approach phase.

The Ground Speed Mini function does not correct Green Dot, S and F speeds.

PRINCIPLE

The Ground Speed Mini function takes advantage of the aircraft inertia when the wind varies during the approach in order to provide an appropriate indicated target speed (i.e. the managed target speed represented by the magenta triangle on the PFD). When the flight crew flies this indicated target speed, the energy of the aircraft is maintained above a minimum level that ensures standard aerodynamic margins versus the stall.
The minimum energy level is the energy level the aircraft will have at touchdown with an indicated airspeed equal to VAPP, and with the wind equal to the tower reported wind as inserted in the PERF APPR page. The ground speed then equals the Ground Speed Mini.
The Ground Speed Mini is not displayed to the flight crew.

During the approach, the FMGES continuously computes the managed target speed in order to keep the ground speed at or above the Ground Speed Mini.

Ident.: DSC-22_30-60-20-B-00019831.0001001 / 18 MAY 22

MANAGED SPEED TARGET COMPUTATION

The computation of the managed speed target uses the tower headwind component, the current headwind component, and the VAPP.

TOWER HEADWIND COMPONENT

The tower wind is the average wind provided by the ATIS or the tower. The flight crew enters the tower wind in the MAG WIND field in the PERF APPR page.
The tower headwind component is the projection of the MAG WIND on the runway axis. This computation is based on the runway inserted in the FMS active F-PLN.

CURRENT HEADWIND COMPONENT

The projection of the current wind measured by the ADIRS on the aircraft longitudinal axis is the current headwind component (instantaneous headwind).

Ident.: DSC-22_30-60-20-B-00019974.0001001 / 18 MAY 22

VAPP COMPUTATION

The FMS computes the VAPP, and displays it on the PERF APPR page. The VAPP computation takes into account the tower headwind component. VAPP is the highest of the following computations:
- VAPP = VLS + 1/3 x TWR HEADWIND COMPONENT, or
- VAPP = VLS + 5 kt.

Note: *“1/3 of the TWR HEADWIND COMPONENT” has 2 limits:*

- *0 kt as the minimum value (no wind or tailwind)*
- *+15 kt as the maximum value.*

The flight crew can manually modify the VAPP and the MAG WIND values on the PERF APPR page.

Ident.: DSC-22_30-60-20-B-00025780.0001001 / 04 MAY 23

MANAGED SPEED TARGET COMPUTATION

The FG continuously computes the managed speed target that is equal to VAPP plus an additional increment. This increment takes into account the headwind variation during the final approach.

The managed speed target is computed as follows:
- Above 400 ft RA:
  Managed speed target =VAPP + (CURRENT HEADWIND COMPONENT - TWR HEADWIND COMPONENT).
- Below 400 ft RA:
  Managed speed target = VAPP + K x (CURRENT HEADWIND COMPONENT - TWR HEADWIND COMPONENT)
  "K" factor reduces from 1 to 0.33 in 25s.

The managed speed target has the following limits:
- VAPP, as the minimum value
- VFE next, in CONF 0, 1, 2, 3, VFE - 5 kt in CONF FULL, as the maximum value.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-60-20-00025779.0001001 / 18 MAY 22
Applicable to: ALL

Managed speed disengages any time the flight crew selects a speed target on the FCU, or if the speed was preselected.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-60-30-00019302.0001001 / 18 MAY 22
Applicable to: ALL

When the speed target is selected, the SPD/MACH window of the FCU displays this speed target. The PFD displays the associated speed target on the airspeed scale. The flight crew uses the knob on the FCU to set this speed target.
For more information on the Speed/Mach Control Area, *Refer to DSC-22_10-40-20 Speed/Mach Control Area*.
For more information on the PFD Airspeed Indications, *Refer to DSC-31-40 Airspeed*.

Note: *If the selected speed/Mach target is set below VLS or above VMAX, with the autothrust active, the FMGES automatically limits the speed to:*
- *VLS, or*
- *VMAX in the case VMAX is equal to VFE, or*
- *VMAX - 5 kt in the case VMAX is equal to VMO/MMO*

Selected speed has priority over managed speed. The only automatic change-over from selected to managed speed target may occur at go-around mode engagement.
In flight, if the situation calls for managed speed, both the PFD and the MCDU display a message proposing a manual change to managed speed (for example SET MANAGED SPEED, CHECK SPEED MODE, SET HOLD SPEED).

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-60-30-00025781.0001001 / 18 MAY 22
Applicable to: ALL

The speed/Mach target becomes selected, if one of the following occurs:
- The flight crew pulls out the SPD/MACH knob (earliest 5 s after lift-off), or
- Both AP/FDs are OFF (except in APPR phase), or
- The FM speed target is lost except below 700 ft RA in takeoff, LAND or go-around mode, or
- The MCDU has a preselected speed for the next phase, and the aircraft transitions into that phase, or
- The FMGEC is powered up in flight, or
- 5 s after lift off when a takeoff is initiated without managed speed target, or
- The AP/FD TCAS ◁ mode due to a RA.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-60-30-00025782.0001001 / 18 MAY 22
Applicable to: ALL

The selected speed target disengages when:
- The managed speed target engages, or
- On ground at AP or FD engagement, or
- On ground at engine start.

Note: *It is not possible to activate selected speed mode on ground with engines running and FD ON until after takeoff.*

SPEED/MACH FCU WINDOW SYNCHRONIZATION

Ident.: DSC-22_30-60-40-00019306.0001001 / 18 MAY 22
Applicable to: ALL

However, the window of the FCU displays the target speed or MACH in the following situations:

- The flight crew turns the SPD/MACH knob.
  The value in the window first synchronizes with the current SPD/MACH, then displays the manual selection. It remains displayed for 45 s depending upon FCU standard, then reverts to dashes if the flight crew does not pull the knob
- The flight crew manually engages a selected SPD target
- If the flight crew has manually preselected that speed or Mach value for the next phase on the PERF page:
  - That preselected speed or Mach value engages when the aircraft enters that phase, and
  - The FCU window then displays this preselected speed or Mach as the target
- If the FMGES is powered up in flight, the synchronized speed/Mach value is the current aircraft speed or Mach
- If no V2 is entered at takeoff, the V/S mode engages 5 s after lift-off (no SRS TO). The FCU speed target is the speed at V/S mode engagement. (A/THR becomes active when the thrust levers are set in the active range)
- If both FMGECs fail, the displayed speed is the last aircraft speed acquired before the failure.

Intentionally left blank

SPEED/MACH SWITCHING

Ident.: DSC-22_30-60-50-00019304.0001001 / 18 MAY 22
Applicable to: ALL

Speed/Mach switching can be automatic, or manual.
The speed/Mach target (selected or managed) is displayed on the FCU.
The flight crew may check the speed/Mach target computed by the FMS at the crossover altitude in the PERF page.

AUTOMATIC SWITCHING

During climb, at the crossover altitude, the managed speed target automatically changes to the associated Mach target.
During descent, at the crossover altitude, the managed Mach target automatically changes to the associated speed target.

Note: *The flight crew may enter a speed target in the PERF CLB page, or a speed/Mach target in the PERF DES page. Even if it has been entered by the flight crew, this entry is still considered as a managed speed.*

MANUAL SWITCHING

When the speed/Mach mode is selected, the flight crew has to perform the switching, by pressing the SPD/MACH pb on the FCU (*Refer to DSC-22_10-40-20 Speed/Mach Control Area*).

Intentionally left blank

GENERAL

Applicable to: ALL

Ident.: DSC-22_30-70-A-00022155.0001001 / 18 MAY 22

The approach and landing capability provides the flight crew with the aircraft capability to perform an approach, and land the aircraft.
The FMA displays this capability.

The approach and landing capability depends on:
- The availability of aircraft systems,
- The type of approach selected on the ARRIVAL page.

For more information about the minimum required equipment to compute approach and landing capabilities, *Refer to QRH/OPS Required Equipment for CAT2 and CAT3*.

The approach and landing capability enables the flight crew to determine:
- The available minima of the approach
- The available landing technique.

Ident.: DSC-22_30-70-A-00025155.0001001 / 18 MAY 22

APPROACH AND LANDING CAPABILITY WITH ILS/GLS ◁ /SLS ◁

Approach and Landing Capability	Type of Approach Selected	Available FMA Guidance	Lowest Available Minima	Aircraft Landing Capability
CAT3 DUAL	ILS CAT I, II, III	LOC - G/S	Down to CAT III B	Autoland(1)
CAT3 SINGLE	ILS CAT I, II, III	LOC - G/S	Down to CAT III A	Autoland(1)
CAT2	ILS CAT I, II	LOC - G/S	Down to CAT II	Autoland(1)
AUTO LAND	GLS ◁	LOC - G/S	Down to CAT I	Autoland(1)
CAT1	ILS CAT I	LOC - G/S	Down to CAT I	Manual landing
	GLS ◁			
	RNAV(GNSS) with LPV minima (with SLS ◁).		Down to LPV	

(1) *The flight crew shall refer to the QRH to establish the actual landing capability, if some equipments not monitored by the FMGES are inoperative.* *Refer to QRH/OPS Required Equipment for CAT2 and CAT3.*

Note: *No approach and landing capability is displayed on FMA for RNAV(GNSS) with LP minima (with SLS ◁).*

FAIL CONCEPT

Ident.: DSC-22_30-70-00022071.0001001 / 18 MAY 22
Applicable to: ALL

FAIL-OPERATIONAL AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-operational if, in the event of a failure below alert height, the remaining part of the automatic landing system allows the aircraft to complete the approach, flare, and landing.
The CAT3 DUAL approach and landing capability is fail-operational automatic landing system.

Note: *In the event of a failure, the automatic landing system operates as a fail-passive system.*

FAIL-PASSIVE AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-passive if, in the event of a failure, there is no significant out-of-trim condition, or deviation of flight path or attitude, but the landing is not completed automatically.

The following approach and landing capabilities are fail-passive automatic landing system.
- CAT3 SINGLE
- CAT2
- CAT1

Note: *With a fail-passive automatic landing system, the flight crew controls the aircraft after a failure.*

DISPLAY

Ident.: DSC-22_30-70-00022072.0001001 / 04 MAY 23
Applicable to: ALL

The approach and landing capability is displayed in the "Approach and Landing Capability" column of the FMA and of the HUD ◁ , when:
- An LS approach is manually or automatically selected on the ARRIVAL page
- The flight crew presses one of the following pushbutton on the FCU:
  - The LS pb, or
  - The LOC pb, or
  - The APPR pb.

The FMAs displays the approach and landing capability in accordance with the state of the aircraft systems, and the flight guidance systems that are engaged.

Note: *No approach and landing capability is displayed when an RNAV (RNP) approach is selected in the FMS.*

L2 If the FMGEC is not able to compute the approach and landing capability, CAT 1 capability is displayed on the FMA, regardless of the FMS flight phase.

L1 APPROACH WITHOUT FLS ◁ FUNCTION

Depending on the approach selected, the CAT 1 approach and landing capability appears as soon as the flight crew presses one of the LS pb.
The computation of the CAT 1, CAT 2, CAT 3 SINGLE or CAT 3 DUAL approach and landing capability depends on the AP engagement. Therefore, when the flight crew presses the APPR pb to arm or engage the final approach mode, and one or both AP(s) is engaged then CAT 1, CAT 2, CAT 3 SINGLE or CAT 3 DUAL approach and landing capability can be displayed (both APs are necessary for CAT 3 DUAL).
However, if the North reference is TRUE, the CAT 1 is the only available capability.

L2 CAT 1, CAT 2, CAT 3 SINGLE or CAT 3 DUAL approach and landing capability is computed only if the aircraft is above 400 ft RA when the flight crew arms the approach modes.

Below 200 ft RA, CAT 3 SINGLE, or CAT 3 DUAL is memorized and remains displayed as long as:
- At least one AP is engaged, and
- LAND, FLARE, or ROLL OUT is engaged.

L1 APPROACH WITH FLS ◁ FUNCTION

If the flight crew selects an approach with the FLS ◁ function, and the active FMS flight phase is CRZ, DES or APPR, the approach and landing capability appears as soon as the flight crew presses the LS pb.

Intentionally left blank

AUTOLAND WARNING

Ident.: DSC-22_30-80-10-00025236.0003001 / 18 MAY 22
Applicable to: LV-FVH, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KHT

The AUTOLAND red lights flash when:
- At least one AP is engaged below 200 ft RA, with LOC and G/S armed, or with LOC, G/S, LAND or FLARE engaged, and the radio altimeter indications differ by more than 15 ft, or
- At least one AP is engaged below 200 ft RA, with LAND or FLARE mode engaged, and one of the following conditions occurs:
  - The last AP disengages, or
  - The aircraft excessively deviates from the ILS beams (See 1), or
  - The ILS signal is lost (See 2), or
  - A long flare (1 000 m with FLARE engaged) is detected, or
  - A too-early flare (FLARE engages less than 2 s after LAND engagement) is detected.

Note: *1. LOC deviation 1/4 dot above 15 ft RA, GLIDE deviation 1 dot above 100 ft RA (LOC or GLIDE scale flashes on the PFD)*
2. LOC signal is lost above 15 ft RA, or GLIDE signal is lost above 100 ft RA (FD bars flash on the PFD, and LAND mode remains engaged).

AUTOLAND WARNING

Ident.: DSC-22_30-80-10-00025236.0002001 / 18 MAY 22
Applicable to: LV-FVI, LV-KAN, LV-KAO, LV-KHU

The AUTOLAND red lights flash, when the LAND mode is engaged below 200 ft RA, and one of the following conditions occurs:
- The last AP disengages, or
- The aircraft excessively deviates from the ILS beams (See 1), or
- The ILS signal is lost (See 2), or
- Radio altimeter indications differ by more than 15 ft, or
- A long flare (1 000 m with FLARE engaged) is detected, or
- A too-early flare is detected: FLARE engages less than 5 s after LAND engagement.

Note: *1. LOC deviation 1/4 dot above 15 ft RA, GLIDE deviation 1 dot above 100 ft RA (LOC or GLIDE scale flashes on the PFD)*
2. LOC signal is lost above 15 ft RA, or GLIDE signal is lost above 100 ft RA (FD bars flash on the PFD, and LAND mode remains engaged).

FMA Display	DES
Column	AP/FD Vertical Modes - Column 2 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 2 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	The descent mode is armed. *Note:* *G/S, F-G/S ◁ or FINAL can be simultaneously displayed with ALT, ALT CST or DES.*

DES (ENGAGED)

Ident.: DSC-22_30-80-20-00025592.0001001 / 18 MAY 22
Applicable to: ALL

FMA Display	DES
Column	AP/FD Vertical Modes - Column 2 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 1 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	Descent mode is engaged. The selected target altitude is lower than the actual altitude. Altitude constraints are taken into account.

DH XXX

Ident.: DSC-22_30-80-20-00025678.0001001 / 18 MAY 22
Applicable to: LV-GKO, LV-GKP

FMA Display	DH XXX
Column	Minimums - Column 4 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 3 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	Decision Height as inserted by the flight crew in the PERF APPR page.

DISCONNECT AP FOR LDG

Ident.: DSC-22_30-80-20-00025696.0007001 / 18 MAY 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

FMA Display	DISCONNECT AP FOR LDG
Column	Special Messages - Column 2 and 3 (*Refer to DSC-22_30-80-20 FMA Display*)

Continued on the following page

Continued from the previous page

Line	Line 3 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	The flight crew must disconnect the AP for landing. This message is displayed when, during a Non-Precision Approach, the AP/FD remains engaged at: - Minimum -50 ft, or - 400 ft AGL (if no minimum entered).

EFIS SINGLE SOURCE 1(2)

Ident.: DSC-22_30-80-20-00025697.0001001 / 18 MAY 22
Applicable to: ALL

FMA Display	EFIS SINGLE SOURCE 1(2)
Column	Special Messages - Column 2 and 3 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 3 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	CM1 and CM2 Display Units are fed by the same source: either CM1 side source (1) or CM2 side source (2). Range and mode selections can be done only by the appropriate side.

EFIS SWTG NOT ALLOWED

Ident.: DSC-22_30-80-20-00025698.0001001 / 18 MAY 22
Applicable to: ALL

FMA Display	EFIS SWTG NOT ALLOWED
Column	Special Messages - Column 2 and 3 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 3 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	The EFIS configuration selected by the flight crew is not allowed: DMC1 for CM2 Display Units, or DMC2 for CM1 Display Units, and the conditions for EFIS SINGLE SOURCE not fulfilled.

EXTEND SPD BRK

Ident.: DSC-22_30-80-20-00025699.0001001 / 18 MAY 22
Applicable to: ALL

FMA Display	EXTEND SPD BRK
Column	Special Messages - Column 2 and 3 (*Refer to DSC-22_30-80-20 FMA Display*)

Continued on the following page

Continued from the previous page

Line	Line 3 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	DES mode is engaged, idle is selected, and either: - The aircraft is above the vertical profile, and the predicted intercept point of the theoretical profile is at less than 2 NM from the next ALT CST, and the predicted aircraft altitude at next altitude constraint is greater than ALT CST-500 ft, or - The aircraft is in auto speed control, if the aircraft enters a speedbrake decelerating segment (next speed limit or speed constraint).

FINAL (ARMED)

Ident.: DSC-22_30-80-20-00025618.0001001 / 18 MAY 22
Applicable to: ALL

FMA Display	FINAL
Column	AP/FD Vertical Modes - Column 2 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 2 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	The FINAL descent mode is armed. *Note:* *G/S, F-G/S ◁ or FINAL can be simultaneously displayed with ALT, ALT CST or DES.*

FLARE

Ident.: DSC-22_30-80-20-00025645.0001001 / 18 MAY 22

Line	Line 1 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	The Vertical Speed mode is engaged to acquire and maintain the V/S selected on the FCU. The target is displayed in blue. If the aircraft reaches VLS or VMAX and cannot maintain the target, the indication is boxed amber and flashes, and the target pulses.

Intentionally left blank

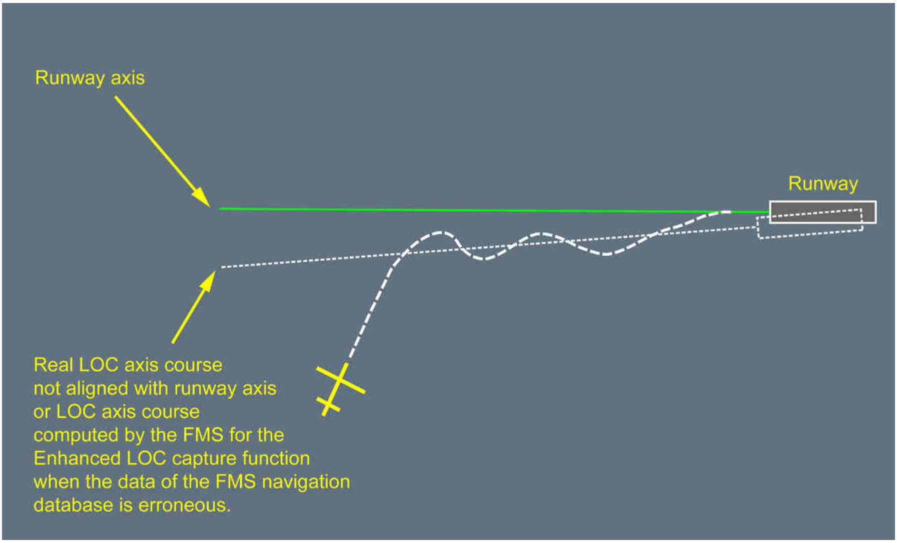
MISBEHAVIOUR OF THE ENHANCED LOC CAPTURE

Ident.: DSC-22_30-110-00023522.0001001 / 10 MAY 21
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

DESCRIPTION

With the Enhanced LOC capture function, the aircraft may oscillate on one side of the LOC axis when one of the following occurs:

- The LOC ground antenna position is unusual (ahead of the runway threshold or not aligned with the runway axis), or
- The LOC course is not aligned with the runway axis, or
- The FMS navigation database is erroneous regarding:
  - The coordinates of the runway threshold, or
  - The coordinates of the LOC ground antenna, or
  - The course of the LOC.



Runway axis
Runway
Real LOC axis course not aligned with runway axis or LOC axis course computed by the FMS for the Enhanced LOC capture function when the data of the FMS navigation database is erroneous.

OPERATIONAL RECOMMENDATION

On approaches where errors are identified in the FMS Navigation Database, the flight crew must manually tune the ILS via the RMP before arming the APPR mode (or the LOC mode).

On runway with unusual LOC position or with LOC course not aligned with runway axis, in case of roll oscillations during LOC capture, the flight crew shall consider to discontinue the approach.

On the next approach, the flight crew must manually tune the ILS via the RMP before arming the APPR mode (or the LOC mode).

GENERAL

Ident.: DSC-22_40-10-00001395.0001001 / 10 JAN 11
Applicable to: ALL

The Flight Envelope (FE) part of the FMGES performs the following functions :
- Acquisition and monitoring of parameters used by FE and FG parts
- Characteristic speeds computation
- Back-up weight and CG computation
- Aft CG monitoring
- Windshear detection.

Intentionally left blank

ACQUISITION/MONITORING

Ident.: DSC-22_40-20-00001396.0001001 / 19 DEC 12
Applicable to: ALL

Acquisition and monitoring of buses common to FM, FG or FE are performed by the FE. Only ARINC buses specific to the FM part are acquired by the FM itself.
Dialogue between FM, FG and FE is achieved through common memories.

PRIM
ACQUISITION/MONITORING
FE PART
COMMON MEMORY
FG PART
COMMON MEMORY
FM PART
FMGC

The FE function generates the following information :
- Flight/ground conditions (LGCIU/SFCC).
- Flap/slat configuration (SFCC).

- Engine configuration (FADEC).
- ADR/IR parameters after filtering and consolidation (used by the control laws).

CHARACTERISTIC SPEEDS COMPUTATION

Ident.: DSC-22_40-30-00001397.0001001 / 21 MAR 17
Applicable to: ALL

FE part computes the characteristic speeds and sends them to :

- The FG which uses them as limits for guidance modes.
- The EFIS for display on the PFD speed scale.

The following speeds are computed :

Minimum speeds

- **VLS**
  (*Refer to DSC-22_10-50-20 Characteristic Speeds*)
- **Manoeuvring speeds F, S, O (Green Dot)**
  (*Refer to DSC-22_10-50-20 Characteristic Speeds*)

Intentionally left blank

WEIGHT AND CENTER OF GRAVITY COMPUTATION

Ident.: DSC-22_40-40-00001399.0001001 / 10 DEC 09
Applicable to: ALL

The FMGC uses the weight and center of gravity from the FCMC (Fuel Computer) when available.

The GW and CG, computed by the FE part, are used :
- As backup, in case of a dual FCMC failure.
- To trigger the aft CG caution and warning signals (independently of the FCMC).

FE WEIGHT COMPUTATION (BACKUP)

- When the aircraft is below 14 625 ft, and 255 kt :
  GW = f(α, CAS, N1/EPR actual, CG from FE part, altitude)
- When the aircraft is above 14 625 ft, or 255 kt :
  GW = TOGW – WFU
  TOGW : Takeoff Gross Weight
  WFU : Weight Fuel Used, acquired from the FADECs.

FE CENTER OF GRAVITY COMPUTATION (BACKUP/AFT CG WARNING)

The CG is computed from the position of the horizontal stabilizer, and is function of the N1/EPR, Vc, ALT, MACH and GW from FE part.

Intentionally left blank

AFT CG MONITORING

Ident.: DSC-22_40-50-00001400.0001001 / 19 DEC 12
Applicable to: ALL

The flight envelope only uses its own computed Gross Weight (GW) and Center of Gravity (CG) to trigger the aft CG signals.
The current CG is compared to the aft CG limit, computed from the GW.
If the CG > CG limit -1 %, an aft CG caution signal is sent to the FCMCs. The target CG is then shifted forward by 1.5 % (only one time). If the CG becomes higher than the CG limit, the aft CG warning signal is sent to the FWCs, which trigger a red warning.

WINDSHEAR DETECTION

Ident.: DSC-22_40-60-00001401.0001001 / 19 DEC 12
Applicable to: ALL

A windshear detection signal is generated whenever the aircraft encounters a windshear and the predicted energy level falls below a predetermined safe minimum energy threshold (reactive windshear detection).

Note: *The energy threshold is expressed as an angle of attack threshold αo.*

The aircraft predicted energy level is $\alpha + \Delta\alpha$ where:
- *α is the current angle of attack*
- *$\Delta\alpha$ is the equivalent AOA computed from measured vertical drafts and longitudinal shears.*

If $\alpha + \Delta\alpha > \alpha o$ the windshear conditions are detected.

The windshear detection function is provided in takeoff and approach phase under the following conditions:
- At takeoff, 3 s after liftoff, up to 1 300 ft RA
- At landing from 1 300 ft RA to 50 ft RA
- With at least CONF 1 selected.

The warning consists of:
- A visual “WINDSHEAR” red message displayed on both PFDs for a minimum of 15 s.
- An aural synthetic voice announcing ”WINDSHEAR” three times.

Wind Data Function....D
Flight Reports....E

Intentionally left blank

GENERAL

Ident.: DSC-22_45-00001402.0001001 / 17 FEB 11
Applicable to: ALL

The FMS AOC function gives an interface between a ground station and one onboard FMGEC, allowing data transmission between these two computers via the ACARS Management Unit or the ATSU.

Two different sets of message can be exchanged:
- UPLINK messages from the ground station. They consist in reception of data requested or directly sent to the crew
- DOWNLINK messages from the FMGEC (master). They consist in reports or requests sent to the ground station.

The FMGES/ACARS or FMGES/ATSU interface enables the following AOC capabilities.
- F-PLN initialization (flight plan and performance data)
- Takeoff data
- Wind data
- Flight reports
- Broadcast data.

Crews can send message using ACARS FUNCTION pages or relevant MCDU pages.
Only one FMGEC talks to the ground station. This FMGEC is called FMGEC “master”.

GENERAL SCRATCHPAD MESSAGES

NOT XMITTED TO ACARS	:	A crew request or report was sent to the ground but the communication was not established or not acknowledged.
NO ANSWER TO REQUEST	:	A crew request was previously sent to the ground and no answer (uplink message) was received within 4 min.

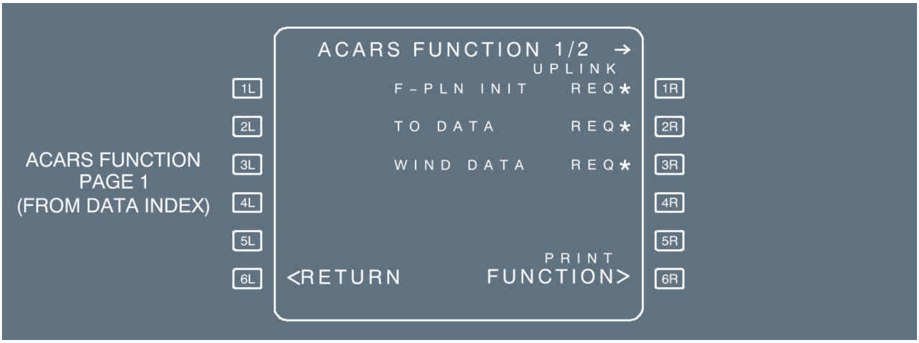
FLIGHT PLAN INITIALIZATION FUNCTION

Ident.: DSC-22_45-00001403.0001001 / 01 OCT 12
Applicable to: ALL

This function enables lateral and vertical flight plan data as well as performance data to be exchanged between the aircraft and a ground station. The aircraft may send flight plan requests for active and secondary flight plan. (downlink messages). The ground station may send flight plan and performance data (uplink messages) either under aircraft request or automatically without any request.
Each uplink message concerns either the active or secondary flight plan but never both flight plans at the same time. The data sent to the aircraft are checked for flight plan consistency.
A MCDU message comes up when an uplink message is received. “ACT (or SEC) RTE UPLINK”.

If an error prevents the decoding process of the message, “INVALID RTE UPLINK” is displayed on MCDUs.
An uplink message can be routed to the active flight plan if no engine is started and no active flight plan exists. Otherwise, it is routed to the secondary. The crew will insert it into the secondary flight plan or will reject it using the CLR key.

Note: *The flight plan may also be initialized using the ACARS FUNCTION page selected from DATA INDEX page.*



PERFORMANCE DATA

On ground and before engine start, the ground station may also send performance data to the aircraft.
Performance data are always associated with the uplink flight plan. It is either automatically inserted with the active flight plan data, or stored in the secondary with the corresponding flight plan.
This message contains part or all of the following data:
ZFW, ZFWCG, taxi fuel, block fuel, cruise flight level, tropopause altitude, cruise temperature, transition altitude, cost index, performance factor.

Note: *After engine start an uplink performance data message is rejected automatically without any scratchpad message.*

SCRATCHPAD MESSAGES RELATED TO FLIGHT PLAN AND PERFORMANCE

INVALID RTE UPLINK	An error is detected, the uplink message is rejected.
ACT or SEC RTE UPLINK	A F-PLN is stored in the active or secondary flight plan.
FLT NUMBER UPLINK	FLT NBR has been initialized within a F-PLN message without previous request.
CHECK FLT NUMBER	The uplinked FLT NBR differs from the one specified in the request.

CHECK CO RTE	The uplinked CO RTE ident differs from the one specified in the request.
INVALID FLT NBR UPLINK	The uplink contains a valid F-PLN but the FLT NBR is invalid.
PERF DATA UPLINK	Performance data is received
INVALID PERF UPLINK	Performance uplink message has been rejected
RTE DATALINK IN PROG	A flight plan modification is performed after a F-PLN INIT request has been sent; this message is displayed until the uplink is received.
UPLINK INSERT IN PROG	This message is displayed during insertion of a Flight Plan.

TAKEOFF DATA FUNCTION

Ident.: DSC-22_45-00001404.0001001 / 03 NOV 21
Applicable to: ALL

The takeoff data function is available for the active flight plan only. It is used to request to the ground station, information data for up to 2 runways and to receive this data for up to 4 runways.
The flight crew sends a request indicating the departure airport, runway idents, CG, GW and weather conditions (such as BARO setting wind, temperature...). In response the flight crew receives the takeoff speeds for up to 4 runways but only one set of data may be inserted in the active flight plan for the selected active runway.
Takeoff speeds are computed for MAX and flex takeoff.

The takeoff data function has required the modification of the standard PERF TAKEOFF page and the addition of 2 news pages:
- UPLINK TO DAT REQ page that enables the flight crew to specify a request to the ground.
- UPLINK XXX TO DATA page (XXX for MAX or FLEX)

These 2 pages are accessed from the PERF TAKEOFF page in PREFLIGHT and DONE phase only.

WIND DATA FUNCTION

Ident.: DSC-22_45-00001405.0004001 / 01 MAR 18
Applicable to: ALL

This function enables the crew to request and to receive forecasted winds associated to the active or secondary flight plan.
The uplink message (ground station to aircraft) may be received upon crew request or automatically without crew request.
The request is initiated from WIND pages or from AOC FUNCTION page.
The uplink wind data when received are directly displayed on the wind pages but not inserted in the flight plan, one set for each flight phase: CLIMB, CRUISE, DESCENT. The alternate wind at alternate cruise flight level is displayed on DESCENT page.

- Winds are associated to altitude for climb an descent phases
- Winds are associated to four altitudes for each waypoint for cruise phase and step level
  - On ground and without entered winds (except the trip wind), an uplink message is directly inserted in the flight plan
  - In flight, winds are temporarily stored until the crew inserts them phase per phase
    Phase of flight is indicated in the WIND title page
  - Clearing the INSERT UPLINK* prompt using the CLR key deletes the uplink wind data for the selected phase.

When uplink winds are deleted, the wind page reverts to the previous status.
The flight crew can modify the wind data of the F-PLN B page, only after the uplink wind data has been inserted. AOC uplink winds are then considered as crew manual entries (large font).

SCRATCHPAD MESSAGES RELATED TO WIND DATA

INVALID WIND UPLINK	An error is detected, the uplink is rejected.
WIND DATA UPLINK	Uplinked winds are received.
WIND UPLINK EXISTS	A F-PLN modification (active or secondary) is attempted when uplink winds are not inserted. This message disappears automatically when the wind uplink is inserted or deleted.
CHECK DEST DATA	The aircraft is at 180 NM from destination, and the destination QNH, TEMP or WIND displayed on the PERF APPR page was received by AOC uplink or, if following insertion of a descent wind uplink, a conflict concerning the above parameters exists.
CHECK ALTN WIND	The uplinked alternate cruise flight level differs from the default alternate cruise flight level.

FLIGHT REPORTS

Ident.: DSC-22_45-00001406.0001001 / 17 FEB 11
Applicable to: ALL

Flight reports provide real time information to the ground concerning the aircraft current situation and position.

Several types of flight reports are available:

- The Position report	:	Provides current aircraft position
- The Progress report	:	Provides data relative to the destination
- The Flight-Plan report	:	Provides the active route
- The Performance Data report	:	Provides performance data currently used by FMS.

These reports may be manually initiated via a dedicated prompt or automatically sent in response to a ground request or upon specific conditions.

POSITION REPORT

This report is sent:
- Manually via a MCDU prompt, or
- Following a ground request, or
- Automatically upon sequencing a designated reporting fix (designated by the ground in a uplink message).

The manual POSITION REPORT downlink prompt is displayed on the REPORT page POS prompt.

REPORT PAGE

Note: Position report are initiated from active flight plan only.

POSITION REPORT CONTENT

The downlinked message contains exactly the REPORT page data.

PROGRESS REPORT

A progress report contains data relative to the aircraft arrival time and EFOB at destination for the active F-PLN.

This downlink message is automatically sent following:
- A ground request, or
- A change of destination, or

- A change of runway, or
- A specific event. The possible events that can be selected in the navigation database policy file are:
  - X minutes to Top of Descent
  - Z minutes to Destination
  - ETA changes more than W minutes from the previous report.
    X, Z and W are minutes of time set in the navigation database policy file.

The progress report cannot be manually sent by the crew via a dedicated MCDU prompt.

PROGRESS REPORT CONTENT

- Flight Number
- Arrival Airport Ident
- Destination Runway Ident
- Predicted remaining fuel
- ETA at destination
- Reason for report (specific event, ground request...).

FLIGHT PLAN REPORT

The F-PLN report broadcasts flight plan data to the ground. Only data from the active flight plan can be sent.

This downlink message is sent to the ground:
- Automatically following a ground request
- Manually by the crew using a prompt displayed on the ACARS FUNCTION page. (Refer to ACARS page description). This prompt may be invalidated through the navigation database policy file.

The Flight Plan report can be downlinked either while on ground or in flight during any flight phase.

FLIGHT PLAN REPORT CONTENT

The report contains the active and alternate flight plan.

PERFORMANCE DATA REPORT

The Performance Data report is a downlink message that allows the transmission of performance data (GW, FUEL, CG...) relative to the active F-PLN.
This message is automatically sent following a ground request. Manual sending is not possible.

PERFORMANCE DATA REPORT CONTENT

Sends to the ground:
- Current GW
- Cruise Altitude

- Current CG
- Fuel on Board
- Block Fuel
- Reserve Fuel
- Cost Index
- Top of Climb Temperature
- Climb Transition Altitude
- Tropopause Altitude
- Taxi Fuel
- ZFW
- ZFWCG

AOC/Printer Programming Options....................B

Intentionally left blank

PRINT FUNCTION

Ident.: DSC-22_46-00001407.0004001 / 01 MAR 18
Applicable to: ALL

The print function enables several types of data and report to be printed:
- Flight plan initialization data
- Takeoff data
- Wind data
- Preflight report
- In flight report
- Post flight report

The 3 first reports may differ when automatically or manually printed for the following reason:
- The automatic process prints the uplink message although the manual process prints the current active data as displayed on the relevant MCDU pages.
- The last 3 reports being processed from the same sources are identical in automatic or manual printing.

Note: *AOC is not necessary linked to printing process. The printing function may be activated within the FMGES and selected independently from the AOC.*

- One or several print functions may be deactivated.
- If an AOC function is not active, (not selected in the NAV database policy file) the printing process is invalidated for this specific AOC function.

AOC/PRINTER PROGRAMMING OPTIONS

Ident.: DSC-22_46-00003947.0001001 / 15 FEB 11
Applicable to: ALL

Option programming for the AOC/PRINTER functions is obtained through the Navigation Data Base policy file or the Airline Modifiable Information (AMI) file.
The list summarizes the possible options :

Data Link (ACARS or AOC) Inhibit	Disables AOC functions
F-PLN Data Request Inhibit	Disables uplink and downlink requests of F-PLN initialization data
Performance Data Request Inhibit	Disables uplink and downlink requests of Performance Initialization data
Takeoff Data Request Inhibit	Disables uplink and downlink request of Takeoff Initialization data
Wind Data Request Inhibit	Disables uplink and downlink request of predicted wind data
Flight Number Enable	Flight Number is included within the F-PLN Request or Progress Report downlinks

Position Report Inhibit	Disables a manual Position Report downlink
Progress Report Triggers	Defines the triggers for the automatic downlink of the Progress Report
F-PLN Report Inhibit	Disables the manual downlink of the F-PLN Report
Auto Print of ACARS or AOC uplinks	Selects/Deselects the automatic printing of the F-PLN, INIT, TO and wind data uplinks. If Autoprint is selected, the crew can deselect it manually. If auto printing is deselected, the crew cannot manually reselect it.
Auto Print of Flight Reports	Selects/Deselects the automatic printing of the Preflight, Inflight, Postflight reports. If selected, the crew can deselect it manually. If autoprint is deselected, the crew cannot manually preselected it.

INTRODUCTION

Ident.: DSC-23-10-10-00026528.0001001 / 15 NOV 23
Applicable to: ALL

The communication system enables:
- Internal communication between the:
  - Flight crew and additional cockpit occupant(s)
  - Cabin crew
  - Ground crew
  - Passengers (i.e. for flight or cabin crew announcements).

  Internal communication is possible via the flight, cabin, and service interphones, and via the Passenger Address (PA).
- External communication via radio communication (HF or VHF) or Satellite Communication (SATCOM ◁), either in voice mode or data mode.

COMMUNICATION SYSTEM ARCHITECTURE

Ident.: DSC-23-10-10-00019801.0001001 / 15 NOV 23
Applicable to: ALL

The communications system comprises the following subsystems:
- VHF / HF transceivers
- Radio tuning systems (Radio Management Panels)
- Audio integrating system (Audio Management Unit, Audio Control Panels)

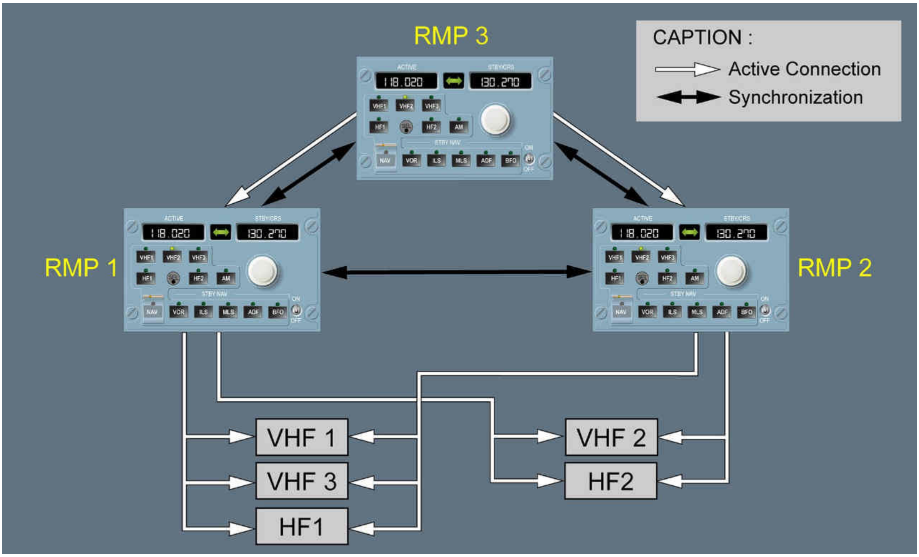
DESCRIPTION

Ident.: DSC-23-10-20-00000038.0003001 / 05 MAR 19
Applicable to: ALL

Identical RMPs :
- Give the flight crew control of all radio communication systems (VHF and HF frequency control).
- Provide backup to the FMGECs for controlling radio navigation systems (*Refer to DSC-34-10-30-10 General*).

Two RMPs are on the center pedestal, and a third on the overhead panel.
Each RMP can control any VHF or HF transceiver. RMP1 and 2 are connected directly to all VHF and HF transceivers, whereas RMP3 is connected to them via RMP1 and 2. RMPs are connected together so that each RMP is updated with the selections made on other RMPs.
Only RMP1 functions in EMER ELEC CONFIG.



If two RMPs fail, the remaining one controls all the VHF and HF transceivers.

(1) Frequency displays

- The ACTIVE display window shows the active frequency of the selected radio, which is identified by a green light on the selection key.
- The STBY/CRS (standby / course display) display window shows a standby frequency that the pilot can activate by pressing the transfer key or change by rotating the tuning knobs. For a description of the CRS function *Refer to DSC-34-10-30-30 Radio Management Panel (RMP)*.

(2) Transfer key

Pressing this key moves the active frequency to the standby window and the standby frequency to the active window.
This tunes the selected receiver to the new active frequency.

(3) Radio comm. selection keys

When the pilot presses one of these keys:
- The ACTIVE window displays the frequency set on that radio.
- The STBY/CRS window displays the selected frequency or course.
- The selected key displays a green monitor light.

(4) Frequency selector knobs
The pilot uses these concentric knobs to select the STBY frequency or CRS.
The outer knob controls whole numbers; the inner knob controls decimal fractions.

(5) AM pushbutton switch
If the aircraft has HF radios and the flight crew has selected an HF tranceiver, this switch selects the AM mode. (The default mode is the SSB, or single side-band, mode).
This key displays a green monitor light when the AM mode is active.

(6) SEL indicator

The SEL indicator comes on in amber on both RMPs when a transceiver normally associated with one RMP is tuned by another:
- VHF1 tuned by RMP2 or 3,
- VHF2 tuned by RMP1 or 3,
- VHF3, HF1, HF2 ◁ tuned by RMP1 or 2.

(7) NAV pushbutton switch (with transparent switchguard)
The pilot presses this key to be able to select navigation receivers and courses through the RMP. It does not affect the selection of communication radios and their frequencies *Refer to DSC-34-10-30-30 Radio Management Panel (RMP)* for additional information.

(8) Radio navigation selection keys
The pilot presses one of these keys to select a navigation radio to control through this RMP.
This turns on the green monitor light in the key.
Refer to DSC-34-10-30-30 Radio Management Panel (RMP) for additional information.

(9) ON/OFF switch
This switch controls the power supply of the RMP.

Note: *RMP3 is able to control VHF and HF transceivers through RMP1 and RMP2 even when they are OFF.*

The SEL indicator comes on in amber on both RMPs when a transceiver normally associated with one RMP is tuned by another:
- VHF1 tuned by RMP2 or 3,
- VHF2 tuned by RMP1 or 3,
- VHF3, or HF tuned by RMP1 or 2.

(7) NAV pushbutton switch (with transparent switchguard)
The pilot presses this key to be able to select navigation receivers and courses through the RMP. It does not affect the selection of communication radios and their frequencies *Refer to DSC-34-10-30-30 Radio Management Panel (RMP)* for additional information.

(8) Radio navigation selection keys
The pilot presses one of these keys to select a navigation radio to control through this RMP. This turns on the green monitor light in the key.
Refer to DSC-34-10-30-30 Radio Management Panel (RMP) for additional information.

(9) ON/OFF switch
This switch controls the power supply of the RMP.

Note: *RMP3 is able to control VHF and HF transceivers through RMP1 and RMP2 even when they are OFF.*

(10) LOAD FUNCTION ◁
When the ATC sends (CONTACT or MONITOR) CPDLC messages to the flight crew, a white light above the LOAD key comes on to indicate that the sent frequency is available to be loaded.

Press on this LOAD key before closing the CONTACT/MONITOR messages to load this VHF frequency to the STBY/CRS window.

Note: *When a frequency from the ATC services (sent via datalink) has been received, the ATSU validates the frequency and simultaneously sends the information to all the RMP in order to activate the LOAD function.*
When the LOAD function is activated, the flight crew can repeatedly load the frequency on each RMP as often as necessary; except if DATA is present on standby window.

AUDIO MANAGEMENT SYSTEM

Ident.: DSC-23-10-30-00019154.0001001 / 17 MAR 17
Applicable to: ALL

The audio management system allows the flight crew to use :
- all the radio communication and radio navigation facilities installed on the aircraft in transmission and reception mode.
- the interphone systems
- the call systems
- the passenger address system

The audio management system includes :
- an audio management unit (AMU)
- three or four audio control panels (ACPs)
- sockets at each pilot's station
    - headset jack, boomset connector and hand microphone connector for pilot, copilot, third and fourth occupant ◁
    - headset jack for the fourth occupant
- one interphone jack socket at the ground power receptacle
- boomsets for the pilot, copilot, third and fourth occupant ◁ and three or four hand microphones ◁ .
- three cockpit oxygen mask microphones
- one radio press-to-talk switch on each sidestick
- one SELCAL code selection panel
- two cockpit loudspeakers with separate volume controls
- an audio switching facility

If audio channel 1 or 2 fails due to a failure either in an ACP or the corresponding AMU, the crew can use the AUDIO SWITCHING selector to select the third audio channel.

CABIN INTERCOMMUNICATION DATA SYSTEM

Ident.: DSC-23-10-30-00019806.0001001 / 03 OCT 17

Applicable to: ALL

The Cabin Intercommunication Data System (CIDS) provides signal transmission, control and processing for the following cabin systems:

- Cabin and service interphone
- Passenger address
- Passenger signs
- Reading lights
- General cabin illumination

- Emergency evacuation signalling
- Lavatory smoke indication
- Passenger entertainment system.

The CIDS includes the following main components:

- Two CIDS directors connected in parallel, one active and the other on standby
- Forward Attendant Panel (FAP) to monitor and control the cabin systems.
  It also includes a programming and test module which allows reprogramming in case of cabin configuration changes
- Attendant stations (FWD, MID, EXIT, AFT)
- Decoder / Encoder Units (DEUs) linked to the two directors:
  - Type A units (for passengers) installed in three rows (left, center, right).
    The loudspeakers, lighted signs, call buttons, call lights and general illumination ballast units are divided into small groups, each connected to a type A DEU
  - Type B units (for attendants) installed on each cabin side. The Area Call panels, attendant handsets, slide / door pressure sensors, attendant indicator panels, are connected to type B DEUs.

DESCRIPTION

Ident.: DSC-23-10-40-00019179.0001001 / 03 NOV 22
Applicable to: LV-GKO, LV-GKP, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The CVR records:
- Direct conversations between crew members in the cockpit
- All aural warnings sounded in the cockpit
- Audio communications received and transmitted
- Intercommunications conversations between crew members
- Announcements transmitted over the PA system, if PA reception is selected on at least one ACP.

Only the last 2 h of recording are retained.

The CVR system consists of:
- A remote microphone behind overhead panel
- A “hot mike” function, which records the crew members voice directly from their microphone, even if the PTT pb is not activated
- A crashproof four-track recorder, equipped with an ULB, in the aft section of the aircraft
- A control panel on the overhead panel.

The CVR is recording automatically:
- On ground during the first 5 min after the aircraft electrical network is energized
- On ground with one engine running
- In flight
- On ground until 5 min after the last engine shutdown.

On ground, when GND CTL pb-sw is pressed, the CVR is recording.

DESCRIPTION

Ident.: DSC-23-10-40-00019179.0002001 / 03 NOV 22
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF

The CVR records:
- Direct conversations between crew members in the cockpit
- All aural warnings sounded in the cockpit
- Audio communications received and transmitted
- Datalink communications received and transmitted
- Intercommunications conversations between crew members
- Announcements transmitted over the PA system, if PA reception is selected on at least one ACP.

Only the last 2 h of recording are retained.

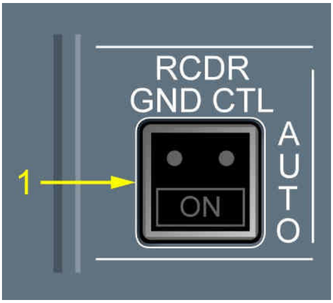
The CVR system consists of:
- A remote microphone behind overhead panel
- A “hot mike” function, which records the crew members voice directly from their microphone, even if the PTT pb is not activated
- A crashproof four-track recorder, equipped with an ULB, in the aft section of the aircraft
- A control panel on the overhead panel.

The CVR is recording automatically:
- On ground during the first 5 min after the aircraft electrical network is energized
- On ground with one engine running
- In flight
- On ground until 5 min after the last engine shutdown.

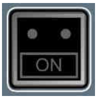
On ground, when GND CTL pb-sw is pressed, the CVR is recording.

CONTROLS AND INDICATORS

Ident.: DSC-23-10-40-10-00019180.0001001 / 30 AUG 18
Applicable to: ALL



(1) RCDR GND CTL pb-sw



The CVR, DFDR, and QAR ◁ automatically operate (AUTO), according to the logic (*Refer to DSC-23-10-40 Description*).

The flight crew manually starts the CVR, DFDR, and QAR ◁ .
After engine start, the ON light goes off and the recorders automatically operate.

Note: *The RCDR GND CTL pb-sw may revert to AUTO (active or inactive, according to the logic) during an electrical transient.*

Ident.: DSC-23-10-40-10-00019181.0002001 / 04 SEP 18
Applicable to: LV-GHQ, LV-GIF

CVR TEST PB

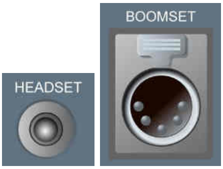
When pressed:
This activates the test, if the CVR is energized.
If an acoustic equipment is plugged into the jack (HEADSET or BOOMSET), the flight crew will hear as low frequency signal.
If the test is not successful, the ECAM triggers the RECORDER CVR FAULT alert 5 s after the pushbutton is pressed.

CVR ERASE PB

When pressed for 2 s, the CVR ERASE function ◁ erases the CVR full recording, if:

- The aircraft is on ground, and
- The parking brake is on.

HEADSET AND BOOMSET JACKS



BOOMSET
HEADSET

When a headset or boomset is plugged into the jack:
- Cockpit sounds, picked up by the microphone, are audible
- The test tone is audible, when the TEST pushbutton is pressed
- The erase tone is audible when the ERASE pushbutton is pressed.

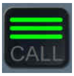
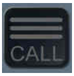
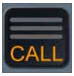
EXTERNAL TRANSMISSION KEYS



The associated communication means (i.e. VHF 1(2)(3), HF 1(2)) is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated channel.

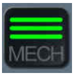


The associated communication means (i.e. VHF 1(2)(3), HF 1(2)) is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated channel.



Flashes to indicate an incoming of SELCAL.
When a SELCAL is received, a buzzer sounds in the cockpit until it is reset, via SELCAL/Call RESET Key.

INTERNAL TRANSMISSION KEYS (INT/CAB)



The INT interphone is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated interphone.

The INT interphone is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated interphone.

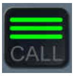
Flashes to indicate an incoming call from the ground crew.
The MECH light goes off after 60 s, if it is not reset.

The CAB interphone is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated interphone.

The CAB interphone is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated interphone.

Flashes to indicate an incoming call from the cabin crew.
The ATT light goes off after 60 s, if it is not reset.

SATCOM TRANSMISSION KEYS



Steady green light indicates when the associated SATCOM channel is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated SATCOM channel.
Flashing green light indicates the establishment of air to ground call of the associated SATCOM channel or the associated SATCOM call is on hold.

The associated SATCOM channel is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated SATCOM channel.

Flashes to indicate an incoming of call from ground via SATCOM channel.

SELCAL/CALL RESET KEY

When pressed, the buzzer sound is cancelled.

PASSENGER ADDRESS (PA) FUNCTION

Refer to DSC-23-20-40 Passenger Address - General.

SATCOM RECEPTION KNOBS

The associated SATCOM channel is not in reception mode. When pressed and released in the out position, the reception knob turns on the reception mode.

The associated SATCOM channel is in reception mode. When pressed and released in the in position, the reception knob turns off the reception mode.
When turned, the reception knob adjusts the volume of the headset.

Note: The ANN LT knob controls the brightness of the reception knob.

INT/RAD SWITCH

The flight crew uses the interphone/Radio Push-To-Talk switch (INT/RAD sw) to activate the boomset, or oxygen mask microphones.

The INT/RAD sw is in the off position.

When set to RAD, the INT/RAD sw activates the boomset or the oxygen mask microphone. However, the appropriate key should be selected first, in order to transmit the message.
When released, the INT/RAD sw returns to the off position.

When set to INT, the INT/RAD sw activates the boomset or the oxygen mask microphone.
When released, the INT/RAD sw remains in the INT position, until the flight crew selects another switch position.

VOICE FILTER KEY

VOICE filter key allows the flight crew to inhibit the most commonly used audio navigation signals (VOR, ADF ◁).

Audio filter function is not active. When pressed, the VOICE filter key turns on the IDENT signals filter.

Audio filter function is active. When pressed, the VOICE filter key turns off the IDENT signals filter.

RECEPTION KNOBS

The associated communication means or interphone (i.e. VHF 1(2)(3), HF 1(2), INT, or CAB) is not in reception mode.
When pressed and released in the out position, the reception knob turns on the reception mode.

The associated communication means or interphone (i.e. VHF 1(2)(3), HF 1(2), INT, or CAB) is in reception mode.

Note: *For the reception of DME audio navigation signals associated with an ILS station, the LS pb on the FCU must also be selected.*
The ANN LT knob controls the brightness of the reception knob.

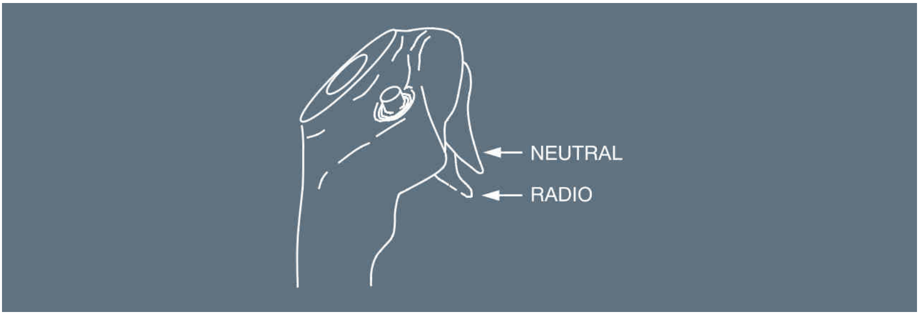
The associated communication means or interphone (i.e. VHF 1(2)(3), HF 1(2), INT, or CAB) is not in reception mode.
When pressed and released in the out position, the reception knob turns on the reception mode.

The associated communication means or interphone (i.e. VHF 1(2)(3), HF 1(2), INT, or CAB) is in reception mode.

Note: *For the reception of DME audio navigation signals associated with an ILS station, the LS pb on the FCU must also be selected.*
The ANN LT knob controls the brightness of the reception knob.

SIDE STICK RADIO SELECTOR

Ident.: DSC-23-10-50-00000079.0001001 / 21 MAR 17
Applicable to: ALL



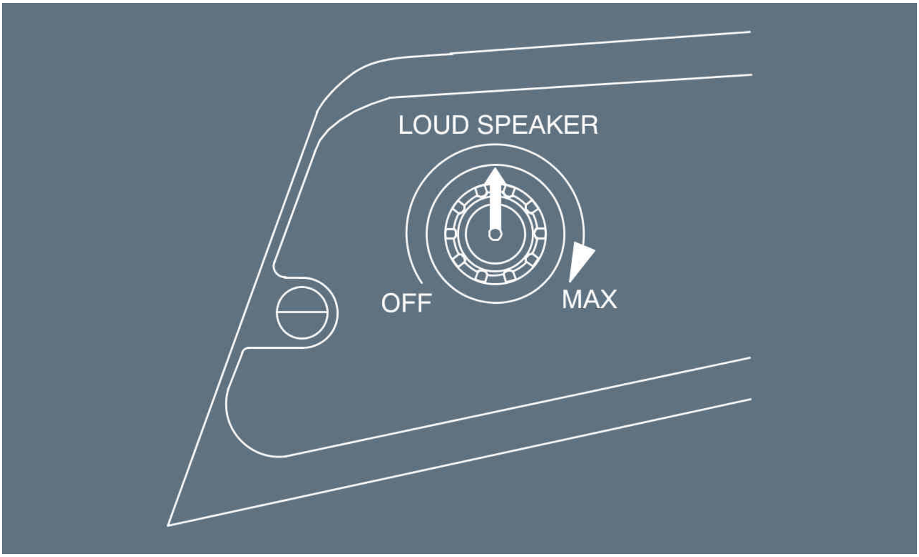
This selector has the same function as the INT/RAD switch on the ACP.

NEUTRAL (spring-loaded)	:	Boom and mask mikes are dead. Reception is normal.
RADIO (aft position)	:	Boom and mask mikes transmit the equipment selected by the transmission key on the ACP.

Note: *If RADIO is selected on the side stick when the INT/RAD switch is on INT, the radio function has priority over the interphone function.*

LOUDSPEAKER VOLUME KNOB

Ident.: DSC-23-10-50-00000081.0001001 / 21 MAR 17
Applicable to: ALL



This knob adjusts the volume of the loudspeaker for radio communication.

OFF	:	Loudspeaker does not respond the signals from the aircraft's radio equipment.
Clockwise rotation	:	Loudspeaker broadcasts signal from the aircraft's radio equipment at increasing volume.

Note: *This knob does not control the loudness of aural alert and voice message. In the case of acoustic feedback (i.e. Larsen effect) from the cockpit loudspeaker, the flight crew should reduce the volume of the cockpit loudspeaker. However, the flight crew should ensure that the volume of the cockpit loudspeaker is sufficient to hear radio communication.*

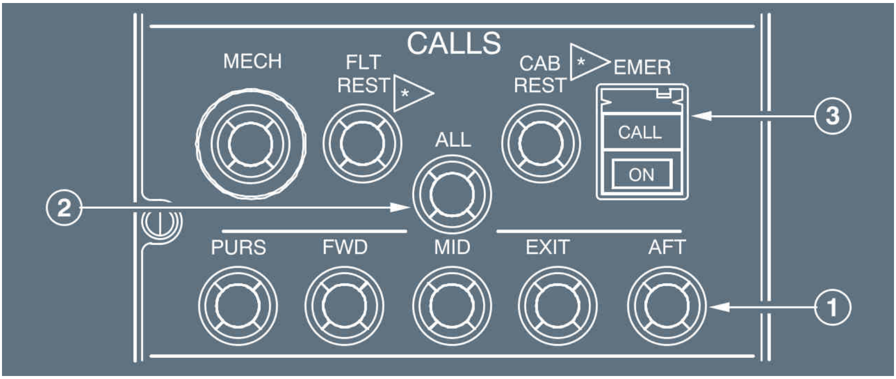
CABIN CALL SYSTEM

Applicable to: ALL

Ident.: DSC-23-20-20-10-00019177.0001001 / 02 NOV 16

CALL FROM THE COCKPIT



(1) FLT REST ◁* /CAB REST ◁* /PURS/FWD/MID/EXIT/AFT pushbutton

Pressed: A steady pink light comes on, on the corresponding area call panel.
“CAPTAIN CALL” appears on the corresponding attendant indication panel, and a green light comes on.
A high–low chime sounds through corresponding loudspeaker.

Note: The FLT REST/CAB REST call button is operative, if the corresponding compartment is installed on the aircraft.

(2) ALL pb

Pressed: All stations respond as indicated above, and “CALL ALL CAPT” appears on the attendant indication panels.

(3) EMER pb-sw (Guarded)

ON : A red or pink light comes on, at all area call panels.
“CALL PRIO CAPT” appears on all attendant indication panels, and a red light comes on.
High–low chime is repeated three times, through all loudspeakers. The ATT flashes in amber, on the Audio Control Panels.

ON lt : This light comes on in white for an emergency call from the cockpit or the cabin.

CALL lt : This light comes on in amber for an emergency call from the cockpit.

For an emergency call from the cabin to the cockpit:
- The amber CALL light flashes.
- The ATT flashes in amber on the audio control panels.
- The buzzer is repeated three times in the cockpit.

The system resets, when the attendant hangs up the associated handset.

DESCRIPTION

Ident.: DSC-23-30-10-00019802.0001001 / 17 MAR 17
Applicable to: ALL

Each transceiver can be tuned by any of the three Radio Management Panels (RMPs). The flight crew uses the Audio Control Panel (ACP) to select a VHF or HF system, and transmit. The ACP operates via the Audio Management Unit (AMU). Each system is connected to the RMPs, for frequency selection, and to the AMU for connection to the audio-integrating and SELCAL (selective calling) systems.

VHF

Ident.: DSC-23-30-10-00019145.0001001 / 17 MAR 17
Applicable to: ALL

The aircraft has three identical VHF communication systems. Each system has a transceiver in the avionics compartment, and an antenna on the fuselage. Only VHF1 operates in EMER ELEC CONFIG. The VHF1 range is from 118.0 to 136.975 MHz. The VHF has an alarm to indicate that the microphone ◁ is stuck. If a microphone is in the emission position for more than 30 s, an interrupted tone sounds for 5 s, and the emission is turned off. To reactivate the emission, the crew releases the push–to–talk button and presses it again.

Note: *The Rockwell Collins' In Flight Entertainment system (IFE) may cause an audible background noise on frequencies : 121.500, 135.000, and 135.005. In addition, the squelch may take a few seconds to close, once transmission on VHF3 frequency 135.005 is finished.*

HF

Ident.: DSC-23-30-10-00019146.0002001 / 05 JUL 17
Applicable to: ALL

The aircraft is equipped with High Frequency (HF) communication system:

- HF1
- HF2 ◁

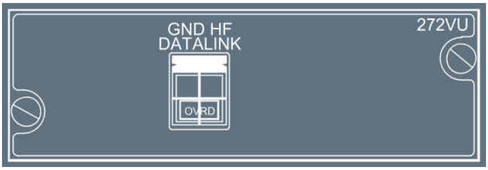
Each HF is composed of a transceiver installed in the avionics compartment, and a common tuner and antenna in the vertical stabilizer. The emission range is from 2.8 to 24.0 MHz.

Note:
- *Only HF1 is supplied in EMER ELEC CONFIG.*
- *HF is lost when LAND RECOVERY is selected ON.*

HF DATALINK ◁

When in data mode, digital information is transmitted between HF1 and ATSU. HF must not be used during refueling.

The HF DATA transmission is inhibited on ground. A GND HF DATALINK pb, located on the overhead panel, may override the inhibition.
The HF VOICE MODE is not inhibited on ground. The use of HF on ground must be limited to operational needs. It is important to check that nobody stays in the direct vicinity of the antennas if the HF is use on ground.



SELCAL (SELECTIVE CALLING)

Ident.: DSC-23-30-10-00019803.0001001 / 17 MAR 17
Applicable to: ALL

Upon receiving a call code corresponding to that of the aircraft, the SELCAL system aurally and visually advises the flight crew that a ground station is calling the aircraft. The aural signal is inhibited during takeoff and landing.

General

GENERAL

Ident.: DSC-23-30-20-10-00000340.0004001 / 26 JUN 15
Applicable to: ALL

The Satellite Communication (SATCOM) system allows the exchange of information between the aircraft and the ground network.
It provides both voice and data channels:
One or several channels are used for voice transmissions (cockpit or cabin voice). The cockpit voice function must be activated, in order for it to be available. The cabin telephone system must be installed, to be able to use cabin voice function.
One channel is used for data transmissions (ATSU or ACARS).
ACARS or ATSU communications normally transmit via VHF 3. They automatically switch to SATCOM when VHF 3 is not available.

The cockpit voice interface is controlled by the Audio Control Panels (ACPs) for call set-up and call termination, and by the MCDU for the call number selection. It allows the crew:
- To initiate air to ground calls and to receive ground to air calls
- To select the call priority, in case of air to ground calls
- To use manual dial or pre-recorded phone numbers.

SATCOM functions are programmed through the Owner Requirement Table (ORT), according to airline needs.
Due to the highly customized programming, the SATCOM functions may vary for different airlines and are, therefore, not described in detail.

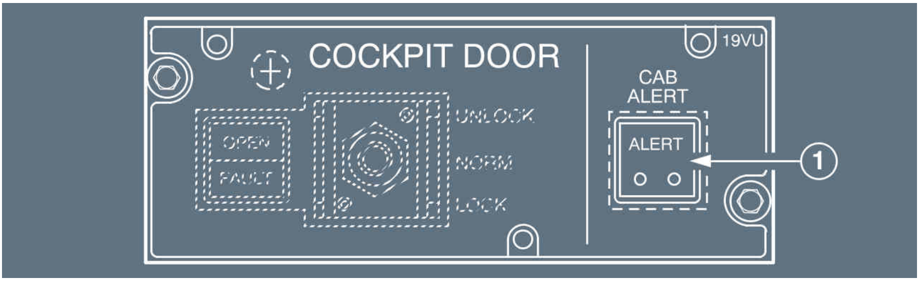
CABIN TO COCKPIT ALERT

Ident.: DSC-23-40-20-00019798.0001001 / 17 MAR 17
Applicable to: LV-GKO, LV-GKP

This function enables the cabin crew to rapidly and discretely alert pilots of any threat in the cabin, such as cockpit intrusion.
The cabin crew activates the alert by pressing one of the pushbuttons located in each attendant's area for a minimum of one second.
When the alert has been activated by the cabin crew, the buzzer sounds continuously in the cockpit, and the cockpit's center pedestal CAB ALERT pushbutton comes on.



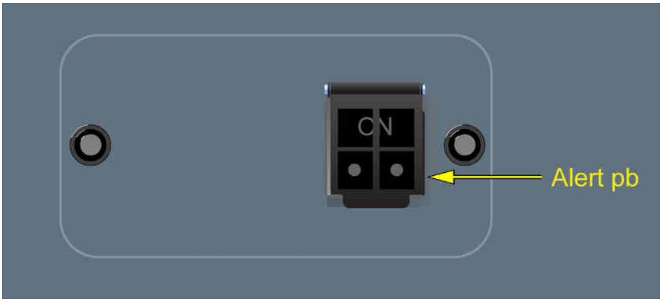
(1) CAB ALERT pushbutton

- ALERT light : This light comes on red, and a buzzer sounds in the cockpit, when an alert has been initiated from the cabin.
- Off : When the cockpit crew pushes the ALERT pushbutton, the buzzer stops and the red ALERT light goes off.

COCKPIT TO CABIN ALERT

Ident.: DSC-23-40-20-00019799.0003001 / 05 MAY 22
Applicable to: LV-GKO, LV-GKP

This function enables the flight crew to inform the cabin crew, via the CIDS network, of any threat in the cockpit. The flight crew activates this alert by pressing one of the two pushbuttons installed in the cockpit.
This also means that the hijacking code will be automatically transmitted to the ATC (*Refer to DSC-34-20-10-30 Remote ATC Box*).



REMOTE ATC BOX PB

	The alert buzzer sounds in the cabin, and the alert lights come on, in each cabin crew station. The ON light only comes on when hijacking code is correctly transmitted to ATC (*Refer to DSC-34-20-10-30 Remote ATC Box*).
	The cockpit to cabin alert is not active.

ONBOARD MOBILE TELEPHONY SYSTEM ⩤

Ident.: DSC-23-47-00015737.0001001 / 05 JAN 15
Applicable to: ALL

GENERAL

The Onboard Mobile Telephony System (OMTS) enables passengers to use their mobile telephones for voice and data services during the cruise phase of flight.
OMTS uses satellite networks for interconnection with the ground. The system is controlled by the cabin crew via a control panel located in the cabin. A cockpit pushbutton is installed for the flight crew on the overhead panel (for description of PORTABLE EQPT & WIRELESS pb-sw, *Refer to DSC-25-20-50-20 PORTABLE EQPT & WIRELESS pb-sw (If Installed)*). This pushbutton-switch enables the flight crew to take control over the system.
The NO MOBILE signs located next to the FASTEN SEAT BELT signs indicate to the passengers when the use of mobile phones is allowed or prohibited.

The Onboard Mobile Telephony System is automatically inhibited:

- Below 3 000 m AGL (approximately 10 000 ft)
- In some geographical areas (refer to the "Regional Operation Data for the Onboard Mobile Telephony System" document for the identification of the geographical areas).

VHF, HF UTILIZATION

Applicable to: ALL

Ident.: DSC-23-50-A-00001899.0001001 / 05 MAR 18

TUNING

The pilot should normally use his onside RMP, to tune any one of the VHF or HF radios.
If a frequency is tuned on the RMP not dedicated to its associated VHF (e.g. VHF 1 tuned on RMP 2), the SEL lights come on (on the 3 RMP) to remind the pilot at least one radio system is not selected on its associated RMP. After each tuning, in order to be able to read VHF 1 and VHF 2 frequencies, the pilot should select the radio system associated with his RMP, this will extinguish the SEL lights.

GENERAL

Ident.: DSC-24-10-10-00017983.0001001 / 21 MAR 16
Applicable to: ALL

The electrical power system consists of a three phase 115/200 V 400 Hz constant-frequency AC system and a 28 V DC system. Electrical transients are acceptable for equipment. Commercial supply has secondary priority.
In normal configuration, the electrical power system provides AC power. The electrical power system is constituted of 2 engine generators and 1 APU generator. Each generator can provide AC power to all electrical bus bars. A part of this AC power is converted into DC power for certain applications.
In the event that normal AC power is not available, an emergency generator can provide AC power.
In the event that all AC power is not available, the electrical power system can invert DC power from the batteries into AC power.

AC Generation

ENGINE-DRIVEN GENERATORS

Ident.: DSC-24-10-20-10-00004813.0004001 / 18 MAR 11
Applicable to: ALL

Two three-phase AC generators (GEN1, GEN2), driven by the engine through an integrated drive, supply aircraft electrical power. Each generator can supply up to 115 KVA of three phase 115/200 V 400 Hz power.

Two Generator Control Units (GCU) control the output of generator. The GCU:
- Controls the frequency and voltage of the generator output.
- Protects the network by controlling the associated generator line contactor (GLC).

APU GENERATOR AND EXTERNAL POWER

Ident.: DSC-24-10-20-10-00017991.0001001 / 21 MAR 16
Applicable to: ALL

An APU generator (APU GEN), driven directly by the APU and producing up to 115 KVA of three phase 115/200 V 400 Hz power, can replace one or more main engine generators at any time.
Two ground power connectors near the nosewheel allow ground power to be supplied to all busbars (with some galleys shed in case of overload). Two ground power units (90 KVA MAX each) can supply the aircraft.

A Ground Power Control Unit (GPCU):
- Protects the network by controlling the External Power Contactor
- Generates a reference frequency used by GCU for synchronisation before No Break Power Transfer (NBPT), or

A Ground and Auxiliary Power Control Unit (GAPCU) ◁ :
- Regulates, via the APU Electronic Control Box, the frequency and voltage of the APU generator when the No Break Power Transfer (NBPT) is required.
- Protects the network by controlling the external power contactor and the APU Generator Line Contactor.

EMERGENCY GENERATOR

Ident.: DSC-24-10-20-10-00000042.0002001 / 18 MAR 11
Applicable to: ALL

The green hydraulic circuit drives an emergency generator that automatically supplies emergency AC power to the aircraft electrical system, if all main generators fail. This generator supplies 8 KVA of three-phase 115/200 V 400 Hz power, except when the Ram Air Turbine powers the green hydraulic circuit, and the aircraft speed is below 260 kt; in this case, the emergency generator supplies 3.5 KVA, leading to some shedding.

A Generator Control Unit (GCU):
- Keeps the emergency generator at a constant speed
- Controls the generator's output voltage
- Protects the network by controlling the emergency generator line contactor
- Controls the emergency generator start-up.

When the emergency generator is automatically or manually coupled, the emergency generator continues to supply DC ESS and AC ESS buses, even if one or more main generators are recovered.

STATIC INVERTER

Ident.: DSC-24-10-20-10-00000044.0001001 / 21 MAR 16
Applicable to: ALL

A static inverter transforms DC power from the DC ESS bus into 2.5 KVA of single-phase 115 V 400 Hz AC power, which is then supplied to part of the AC essential bus. In flight, the inverter is automatically activated, if nothing but the batteries is supplying electrical power to the aircraft, regardless of the position of the BAT 1 and BAT 2 pushbuttons.
On ground, the inverter is activated, if only the batteries are supplying electrical power to the aircraft, and both BAT 1 and BAT 2 pushbuttons are on.

DC Generation

TRANSFORMER RECTIFIERS (TR)

Ident.: DSC-24-10-20-20-00000048.0001001 / 21 MAR 16
Applicable to: ALL

Two main Transformer Rectifiers TR1 and TR2 and one essential TR supply the aircraft's electrical system with DC current.
A fourth TR is dedicated to APU start or APU battery charging.
Each TR controls its contactor by internal logic.

BATTERIES

Ident.: DSC-24-10-20-20-00000050.0003001 / 21 MAR 16
Applicable to: ALL

Two main batteries, each with a normal capacity of 40 Ah, are permanently connected to the two hot busses.
An identical third battery (40 Ah) is dedicated to APU start.
Each battery has an associated Battery Charge Limiter (BCL).
The BCL monitors battery charging and controls its battery contactor.

Intentionally left blank

Contactors

GENERAL

Ident.: DSC-24-10-20-30-00017992.0001001 / 21 MAR 16
Applicable to: ALL

Two identical Electrical Contactor Management Units (ECMUs) provide:
- AC and DC contactors control (excepted TR contactors, which are controlled by the TR itself)
- Galley shedding control
- No Break Power Transfer control (NBPT)
- Monitoring and indicating.

For this purpose, each ECMU receives the following information:
- Voltage of all normal busbars
- Position of all AC and DC contactors
- Availability of all generators, or power source (from GCU, GPCU or GAPCU ◁*)
- Position of all galleys' contactors
- TR status
- Pushbutton position (BUS TIE, GALLEY SHED and COMMERCIAL)
- Flight/ground signal from associated LGCIU.

AC AND DC CONTACTOR CONTROL

Ident.: DSC-24-10-20-30-00000055.0002001 / 21 MAR 16
Applicable to: ALL

ECMU 1 controls :
- The Generator Line Contactor (GLC) 1.
- The AC Bus Tie Contactor (BTC) 1.
- The APU Generator Contactor.
- Both DC Tie Contactors.
- The BUS TIE Contactor
- The External Power Contactor B

ECMU 2 controls :
- The Generator Line Contactor (GLC) 2.
- The AC Bus Tie Contactor (BTC) 2.
- The External Power Contactor A.
- Both DC tie Contactors.

NO BREAK POWER TRANSFER

Ident.: DSC-24-10-20-30-00017994.0001001 / 21 MAR 16
Applicable to: ALL

This function avoids busbar power interruption during supply source transfer on ground in normal configuration. It is inhibited in flight.
The ECMU controls the simultaneous connection of the two sources for a short time. To achieve this, both sources are synchronized on a frequency reference signal sent by the GPCU or GAPCU ◁ .
Synchronization may take up to 15 s for the APU GEN with GPU, and some milliseconds in all other cases.
If synchronization is not achieved within the allowed time, transfer is performed anyway (without simultaneous connection of two sources). This function has a backup in the GCU.

MONITORING AND INDICATING

Ident.: DSC-24-10-20-30-00000066.0001001 / 21 MAR 16
Applicable to: ALL

Each ECMU sends the following information to the ECAM:
- Busbars supplied or not
- Contactor status
- Galley supply status, and galley switch position.

Circuit Breakers

CIRCUIT BREAKERS

Ident.: DSC-24-10-20-40-00000069.0001001 / 21 MAR 16
Applicable to: ALL

All circuit breakers are in the electronic equipment bay.
A Circuit Breaker Monitoring Unit (CBMU) monitors the circuit breaker status. It sends this information to the ECAM system.

Intentionally left blank

General

GENERAL

Ident.: DSC-24-10-30-10-00000073.0002001 / 22 MAR 16

Applicable to: ALL

Each AC BUS is supplied in priority order by :

- the corresponding engine generator.
- the APU generator or the external power A (if both are connected, the APU generator has priority for the left side bars, and the external power has priority for the right side bars).
- the external power B (if both external powers are connected, B has priority for the left side bars and A has priority for the right side bars).
- the other side engine generator.

The APU generator or an external power may supply all the network.
One generators can supply all the network (with galley shedding in case of overload detection).
The generators cannot be connected in parallel (except on ground during No Break Power Transfers).

Intentionally left blank

Normal Configuration

NO BREAK POWER TRANSFER (NBPT) DESCRIPTION

Ident.: DSC-24-10-30-20-00012806.0001001 / 09 OCT 12
Applicable to: ALL

As per design, the NBPT function is effective provided that the power supply sources connections/disconnections are done according to the below table.
If the flight crew does not follow the sequences provided in this table, power transfers without NBPT can be observed.

		POWER SOURCE TO BE CONNECTED OR TO BE DISCONNECTED				
		IDG1	IDG2	APU	EXT PWR A	EXT PWR B
POWER SOURCE CONNECTED	IDG1	▨				
	IDG2		▨			
	APU	NBPT	NBPT	▨	NBPT	▨
	EXT PWR A	NBPT	NBPT	NBPT	▨	
	EXT PWR B	NBPT	NBPT	NBPT		▨

NOTES:

NBPT	: NBPT IS OPERATIVE.
☐	: NBPT IS NOT OPERATIVE.
▨	: NO ELECTRICAL TRANSFER POSSIBLE.

IN FLIGHT

Ident.: DSC-24-10-30-20-00000074.0002001 / 09 OCT 12
Applicable to: ALL

Each engine driven generator supplies its associated AC BUS (1 and 2) via its Generator Line Contactor (GLC 1 and GLC 2).
AC BUS 1 normally supplies the AC ESS BUS via a contactor.
AC BUS 1 supplies TR 1 which normally supplies DC BUS 1, DC BAT BUS.

AC BUS 2 supplies TR 2 which normally supplies DC BUS 2.
AC BUS 1 supplies ESS TR which normally supplies DC ESS BUS.
The two batteries are connected to the DC BAT BUS if they need charging. When they are fully charged the Battery Charge Limiter disconnects them.

EXTERNAL POWER ONLY

If external power A, external power B and the APU generator supply the entire system, the APU generator has priority over external power B.
The display is then the same as the one for APU generator plus external power.
On ground, when only ground services are required, external power can supply the AC and DC GND/FLT buses directly, without supplying the aircraft's entire network.
This configuration is selected via the MAINT BUS switch, located in the forward entrance area.

Abnormal Configuration

FAILURE OF ONE ENGINE GENERATOR

Ident.: DSC-24-10-30-30-00004811.0001001 / 28 AUG 15
Applicable to: ALL

ECMU provides automatic reconfiguration.
Complete network remains supplied.

Note: *If a generator is lost due to overcurrent detection, reconfiguration does not occur and the related AC BUS is lost.*

The system automatically replaces the failed generator with :
- The APU generator if available or,
- The other engine generator (automatically shedding part of the galley load and some commercial loads).

TR FAILURES

Ident.: DSC-24-10-30-30-00000097.0002001 / 14 FEB 11
Applicable to: ALL

The contactor of each TR automatically opens, in case of :
- Overheat
- Minimum current
- Overcurrent
- Open or short circuit.

The ECMU provides automatic reconfiguration (except for APU TR).

Note: *If a TR is lost due to overcurrent detection, reconfiguration does not occur and the related DC BUS is lost.*

FAILURE OF ONE TR

- TR 1 or 2 lost : The available TR replaces the faulty one.
- ESS TR lost : TR 1 replaces the ESS TR.

EMERGENCY GENERATION AFTER LOSS OF ALL MAIN GENERATORS

Ident.: DSC-24-10-30-30-00017995.0001001 / 21 MAR 16
Applicable to: ALL

- **In case of main generators loss:**
  The emergency generator automatically supplies AC power to the aircraft electrical system.

  The green hydraulic pressure, which powers the emergency generator, is provided by:
  - Engine(s) driven pump(s), if at least one engine is running, or
  - The Ram Air Turbine (RAT), if both engines are lost. In this failure case, the RAT automatically extends.
- **If powered by the RAT only:**
  The EMER GEN is inhibited when slats are extended.

The flight crew can also manually activate the emergency generator by pushing the MAN ON pb.

Emergency generator deactivation occurs only automatically :
- In flight : At slats extension ; if powered by the RAT only (both engines are lost) it can be reactivated after slats retraction via the MAN ON pushbutton.
- On the ground : after both engines shutdown.

The EMER GEN TEST pushbutton allows to activate the emergency generator and to connect it to the essential network. This test is inhibited when the slats are extended.

TEST

- If the green hydraulic system, which actuates the emergency generator, is powered by an engine-driven pump, the emergency generator supplies the :
  - AC ESS BUS,
  - AC ESS SHED.

  And, through the ESS TR, the :
  - DC ESS BUS,
  - DC ESS SHED.
- If the green hydraulic system is powered by the Ram Air Turbine, the emergency generator supplies the :
  - AC ESS BUS,
  - DC ESS BUS, through the ESS TR.

All LAND RECOVERY AC and DC BUS bars are shed. They are recovered when the LAND RECOVERY pushbutton is ON.
The AC ESS GND is lost.

GALLEY SHED

FLIGHT WITH BATTERIES ONLY

Ident.: DSC-24-10-30-30-00004812.0003001 / 14 FEB 11
Applicable to: ALL

When emergency generator is not available, the batteries supply :
- the DC ESS BUS
- the DC LAND RECOVERY (whatever the LAND RECOVERY pushbutton position is)

and through the STAT INV :
- the AC ESS BUS
- the AC LAND RECOVERY (whatever the LAND RECOVERY pushbutton position is)

The AC ESS SHED, the DC ESS SHED and the SHED LAND RECOVERY are not supplied.
The AC ESS GND is lost.
Example : flight with batteries only.

Battery Discharge Warning ◁

On ground, an external horn is activated, if the following conditions are met :

- External power contactor OFF (ground power unit disconnected, or EXT PWR pushbutton at OFF ;
- Generators not running ;
- BAT pushbutton switched at auto, and batteries connected to the aircraft network.
  If the batteries are not switched off, the horn automatically stops after 5 min.

(1) BAT 1(2 or APU) selector
Selects the battery for voltage indication.

(2) BAT 1 (2 or APU) Voltage Indication
Selected battery voltage.

(3) BAT 1(2) pb-sw
Controls the operation of the corresponding Battery Charge Limiter.

Auto : The Battery Charge Limiter controls automatically the connection and the disconnection of the corresponding battery to the DC BAT BUS by closing and opening of the battery line contactor.

- The batteries are connected to the DC BAT BUS in the following cases:
  - Battery voltage below 26.5 V (battery charge). The charging cycle ends when battery charge current goes below 4 A (for 10 s on ground, 15 min in flight)
  - On the ground (with speed below 50 kt), when batteries only are supplying the aircraft
  - In flight DC generation lost (limited to 7 s).
- The batteries are connected to the DC ESS BUS when batteries only are supplying:
  - In flight,
  - On ground, speed above 50 kt,
  - On ground, speed below 50 kt, provided they are both selected auto.

Note: 1. *In normal configuration the batteries are disconnected most of the time.*
2. *A battery automatic cut off logic prevents batteries from discharging completely when the aircraft is on the ground (parking).*

Automatic battery contactors open when:
- *The aircraft is on the ground*
- *The main power supply (external power plus all generators) is cut off*
- *The battery voltage is lower than 23 V for more than 16 s.*

The flight crew can reset the contactors by switching the BAT pb-sw to OFF then to AUTO.

OFF : The Battery Charge Limiter is not operating, the DC ESS BUS is not connected to the battery (except in flight in emergency configuration).
OFF comes on white if the DC BAT BUS is powered.
Hot buses remain supplied.

FAULT lt : Comes on amber associated with an ECAM caution, when the charging current for corresponding battery is outside limits.
In this case the battery contactor opens.

(4) APU BAT pb-sw
Controls the operation of the APU Battery Charge Limiter.

AUTO :	The APU Battery Charge Limiter automatically controls the closure/opening of the line APU BAT contactor. The battery is connected in the following cases: • To ensure battery charge (as for BAT 1 or 2) • When the APU start sequence is initiated. *Note: Automatic cut off, as for BAT 1 or 2, is provided.*
OFF :	The Battery Charge Limiter is not operating, the battery line contactor is open. OFF light illuminates.
FAULT lt :	Comes on amber associated with an ECAM caution as for BAT 1 or 2. In this case the battery contactor opens.

(5) AC ESS FEED pb-sw (guarded)

Normal :	The AC ESS BUS is supplied from AC BUS 1. It is automatically supplied by the AC BUS 2 when the AC BUS 1 is lost.
ALTN :	The AC ESS BUS is supplied from AC BUS 2.
FAULT lt :	Comes on amber associated with an ECAM caution when the AC ESS BUS is not electrically supplied. *Note: In case of total loss of main generators the AC ESS BUS is automatically supplied by the emergency generator or by the static inverter if the emergency generator is not available.*

(6) GALLEY pb-sw

AUTO :	The galleys are normally supplied. The ECMU automatically controls the shedding of one or more galleys in case of generator(s) failure or in case of overload detection. On ground when APU generator or the external power supplies, all galleys are supplied provided no overload is detected.
OFF :	All galleys are shed. Water/Waste (drain mast) ice protection is lost. The electrical supply of the heating floor panels is shed.
FAULT lt :	Comes on amber associated with an ECAM caution in case of overload detection if the automatic shedding is not performed. *Note: Switching OFF then AUTO resets the galleys which have been automatically shed by the ECMU.*

(7) COMMERCIAL pb

OFF : The following equipment is shed:
- Galleys
- Cargo loading system
- Electrical service
- Escape slide lock mechanism ice protection
- Water/waste (drain mast) ice protection
- Lavatory and cabin lights
- Water heater
- In-seat power supply ◁
- Passenger entertainment system ◁ .

(8) IDG 1 (2, 3 or 4) (Integrated Drive Generator) pb (guarded)

CAUTION	1. If the pushbutton is pressed for more than about 3 s , damage may occur to the disconnection mechanism. 2. IDG disconnection is inhibited when the engine is stopped or below idle.

IDG switches are normally spring loaded out.
Pressing this switch disconnects the IDG from its drive shaft. Only maintenance personnel can reconnect it.

FAULT lt : Comes on amber associated with an ECAM caution in case of:
- IDG oil outlet overheat (above 185 °C), or
- IDG oil pressure low. Inhibited when the engine is stopped or below idle.

It goes off when the IDG is disconnected.

(9) GEN 1(2) pb

On : The generator field is energized and the line contactor closes, provided electrical parameters are normal.

OFF/R : The generator field is de-energized and the line contactor opens.
The associated Generator Control Unit (GCU) is reset.

FAULT lt : Comes on amber associated with an ECAM caution in the event of protection trip initiated by the associated Generator Control Unit (GCU).
The line contactor opens.

Note: If the protection trip is initiated by a differential fault, the reset action has no effect after two attempts.

(10) APU GEN pb-sw

On :	The APU generator field is energized and the line contactor closes provided parameters are normal. Each bus tie contactor 1 and (or) 2 automatically closes if its associated generator is not operative.
OFF/R :	The generator field is de-energized and the line contactor opens. The associated Generator Control Unit (GCU) is reset.
FAULT lt :	Same as GEN FAULT. APU GEN FAULT light is inhibited when APU speed is too low.

(11) BUS TIE pb-sw

AUTO :	The three BUS TIE contactors open or close automatically according to the priority logic in order to maintain power supply to all AC buses. The three contactors close when: - only one engine generator supplies the aircraft, or - only the APU generator or single ground power unit supplies the aircraft.
OFF :	The three BUS TIE contactors open.

(12) EXT A pb

AVAIL lt :	Illuminates green provided external power parameters are normal.
Momentarily pressed :	- If the AVAIL light was on: • The external power line contactor closes • The AVAIL light goes off • The ON light comes on blue. - If the ON light was illuminated: • The external power line contactor opens • The ON light goes off • The AVAIL light comes on.

(13) EXT B pb

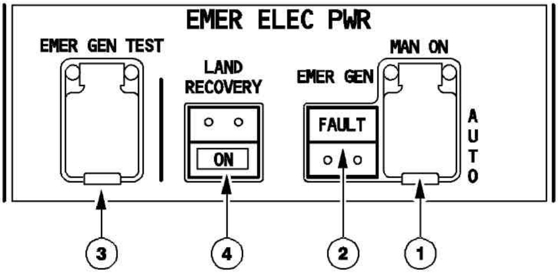
AVAIL lt :	Illuminates green provided external power parameters are normal.

Momentarily pressed :
- If the AVAIL light was on:
  - Provided the APU generator is off the external power line contactor closes
  - The AVAIL light goes off
  - The AUTO light comes on.
- If the AUTO light was on:
  - The external power line contactor opens
  - The AUTO light goes off
  - The AVAIL light comes on.

Note: *1. The APU generator has priority over external power (A and B) for AC BUS 1.*
The external power A has priority over the APU generator for AC BUS 2.
The APU generator has priority over external power B for AC BUS 2.
The engine generators have priority over the external power or APU.
The external power B has priority over external power A for AC BUS 1.
2. When external power B is selected AUTO, AUTO light remains illuminated even when the APU generator has taken over.

ELEC EMER PANEL

Ident.: DSC-24-20-00018024.0005001 / 21 MAR 16
Applicable to: ALL



(1) MAN ON pb (guarded)

AUTO : In case of normal AC supply loss in flight, the emergency generator is automatically started.

Pressed The emergency generator runs and is connected to the aircraft network.

(2) EMER GEN FAULT lt

The light comes on red, if the emergency generator is not supplying and normal AC supply is lost in flight.

(3) TEST pb (guarded)

Pressed and held	:	The emergency generator runs (provided the green hydraulic system is pressurized) and supplies the DC ESS BUS and the AC ESS BUS.

(4) LAND RECOVERY pb-sw

ON When pressed, with the emergency generator running, the AC LAND RECOVERY and the DC LAND RECOVERY buses are recovered and the following equipment are restored:

- LGCIU 1
- SFCC 1 (flap channel is not recovered, if the emergency generator is powered by the RAT).
- BSCU channel 1 (not recovered, if the emergency generator is powered by the RAT)
- LH windshield anti-ice (not recovered, if the emergency generator is powered by the RAT)
- LH landing light (not recovered, if the emergency generator is powered by the RAT)

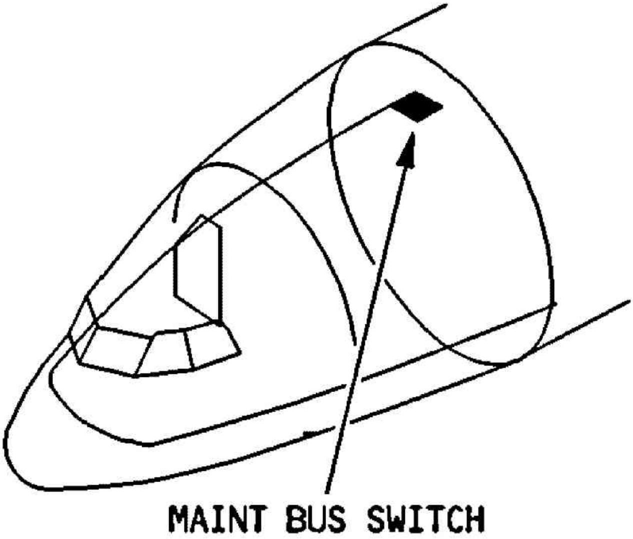
The remaining fuel pump (if any) is lost.

Note: The remaining fuel pump will be shed at 260 kt, if the emergency generator is powered by the RAT, or at LAND RECOVERY selection, whichever occurs first.

When the LAND RECOVERY pb-sw is pressed in EMER ELEC configuration, ADR 3 is lost, and consequently, AP 1 is lost.

FORWARD CABIN

Ident.: DSC-24-20-00000995.0002001 / 21 MAR 16
Applicable to: ALL



This switch allows maintenance and ground service personnel to energize electrical circuits for ground servicing, without energizing the aircraft's entire electrical system.

ON : The selector latches magnetically, provided the external power A parameters are normal (AVAIL light is on). The AC and DC GRND/FLT busbars are supplied and the following services can be energized :

- Passenger compartment lighting
- Galley lighting
- Entrance area lights
- Lavatory lighting and service
- Vacuum cleaner outlets
- Flight compartment service outlets
- Flight compartment flood lighting
- Fuel quantity indications
- Refueling
- Lower deck cargo compartment lighting and power outlets.
- Main and nose landing gear compartment lighting
- Hydraulic compartment lighting
- Landing gear compartment service outlets
- Ground call
- Equipment compartment lights and service outlets
- Navigation lights
- Escape slide locking mechanism ice protection ❄
- Parking brake
- Cargo door hydraulic pump

The switch trips, when the external source is removed.

OFF : The AC and DC GRND/FLT busbars are connected to AC BUS 2 and DC BUS 2.

EXTERNAL POWER PANEL

(A)

IDG Indication:
- normally white
- amber in case of:
  - IDG outlet temperature overheat (above 185 °C) or,
  - IDG oil low pressure or,
  - IDG disconnection.

(B)

IDG number:
- white if associated engine is running
- amber if stopped.

(C)

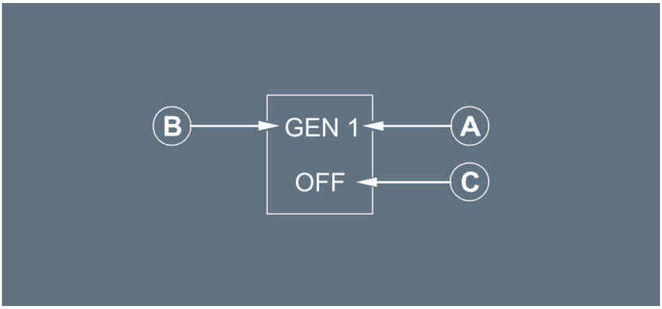
Outlet oil temperature:
- Normally green.
- Green, pulsing in case of advisory (above 151 °C).
- Amber in case of overheat (above 185 °C).

(D)

DISC/LO PR indication:
- DISC appears in amber, if the IDG is disconnected.
- LO PR appears in amber, if an oil low pressure occurs when the IDG is connected. It is inhibited at low engine speed (N2 below 14 %).

(2) GEN 1 (or 2) indications

When the GEN pushbutton is OFF:

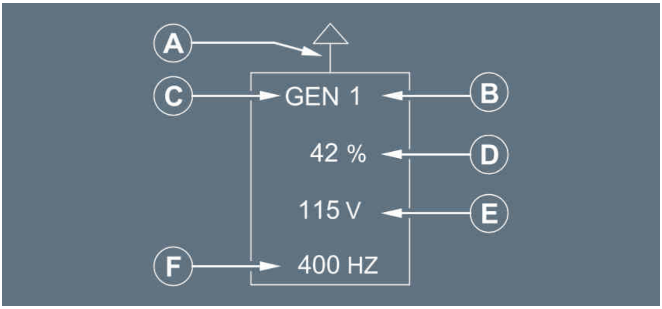


(A) The GEN number is white, if the associated engine is running. It becomes amber, when the associated engine stops.

(B) The GEN indication is amber.

(C) The OFF indication is white.

When the GEN pushbutton is ON:



(A) The arrow indication is green, when the generator line contactor is in line.

(B) The GEN number is white, if the associated engine is running. It becomes amber, when the associated engine stops.

(C) The GEN indication is normally white. It becomes amber, when the generator fails, or when the associated engine stops.

(D) The GEN load is normally green. It becomes amber, if the load is greater than 108 %, for more than 10 s.

(E) The GEN voltage is normally green. It becomes amber below 110 V, or above 120 V.

(F) The GEN frequency is normally green. It becomes amber below 390 Hz, or above 410 Hz.

(3) Bus bar indication
The bus bar indication is normally green. It becomes amber, when the corresponding bar is not powered.

(4) TR indication
The TR indication is normally white. It becomes amber, when the TR fails or in case of abnormal current.

(5) Galley indication

The following legend appears in white, when applicable, depending on the order of priority (1: highest priority):
1. COMMERCIAL OFF
2. GALLEY SHED
3. GALLEY PARTIALLY SHED

GENERAL

Ident.: DSC-25-10-10-00020758.0001001 / 17 MAR 17
Applicable to: ALL

The aircraft and system controls, required for piloting the aircraft, are arranged in such a way that the crew faces forward and all crewmembers can monitor instruments and systems. The designers concentrated system controls on the overhead panel by making extensive use of pushbuttons, directly installed in the system synoptic.

Note: *This chapter describes the panels and equipment of the basic aircraft configuration, and may not correspond to the customized configuration of a specific aircraft.*
For more information on the installed equipment or panels, refer to the relevant chapter's system description.

PRINCIPLES FOR PUSHBUTTONS WITH INTEGRATED INDICATIONS

Ident.: DSC-25-10-10-00000082.0001001 / 21 MAR 17
Applicable to: ALL

Whenever possible, pushbuttons used for corrective actions, have integrated status and failure indications.

The pushbutton positions, and their illuminated indications, follow the “lights out” principle.

- While corresponding to particular aircraft configurations, indications also have the following color codes :
  - Warnings
    RED : A failure requiring immediate action.
  - Cautions
    AMBER : A failure, of which the flight crew should be aware, but does not call for immediate action.
  - Indications
    GREEN : For normal system operation.
    BLUE : For normal operation of a system used temporarily.
    WHITE : - For an abnormal pushbutton position.
    - For a test result or maintenance information.

  When the aircraft is in normal configuration, only green lights can be permanently lit, whereas blue lights can be lit intermittently.
- Pushbutton positions :

POSITION	BASIC FUNCTION
Pressed In	ON, AUTO, OVRD
Released Out	OFF, MAN

Note: 1. *Certain pushbutton lights have two dots, indicating that the corresponding part of the pushbutton is not used.*
2. *Certain pushbuttons do not remain pressed in. These are referred to as "Momentary Action" pushbuttons.*

PILOT AND THIRD OCCUPANT SEAT MECHANICAL ADJUSTMENT

Ident.: DSC-25-10-30-00000096.0001001 / 26 NOV 19
Applicable to: ALL

To adjust a seat mechanically, the occupant must lift the appropriate control handle. This unlocks the seat so that it may be moved. Releasing the control handle returns it to the springloaded locked position. Pilot seat mechanical adjustment is a backup : The seat should be adjusted electrically.

When aligned with the aircraft's centerline, and in the maximum forward position, the third occupant's seat can be rotated by using the rotation lever, located on the seat base.

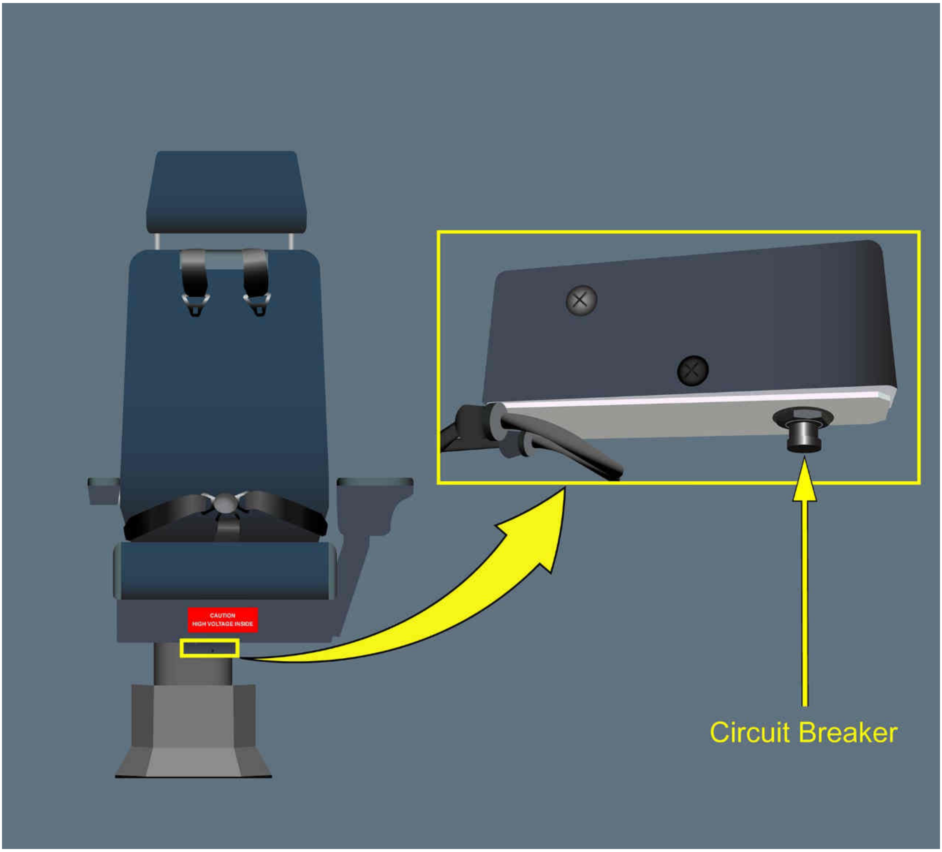
To adjust the vertical position of the lumbar cushion, the occupant must perform all of the following:
- Pull the control handle to the unlocked position
- Turn the control handle, in order to adjust the position of the cushion
- Push the control handle to the locked position.

PILOT SEAT ELECTRICAL ADJUSTMENT

Ident.: DSC-25-10-30-00000098.0001001 / 26 NOV 19
Applicable to: ALL

To electrically adjust a seat, the occupant must press the appropriate control switch in the desired direction. When the seat reaches the desired position, the occupant must release the control switch. The control switch then returns to the spring-loaded neutral position.

L2 Note: *A circuit breaker is under the seat. When this circuit breaker is pulled, it stops the electrical power to the seat.*



HEADREST ADJUSTMENT

Ident.: DSC-25-10-30-00000101.0001001 / 21 MAR 17
Applicable to: ALL

To adjust the headrest in inclination, the occupant must press the inclination control button, and release it to lock the position.
To control the height of the headrest, the occupant must push it horizontally, then adjust the height. Once released, it locks the position.

PILOT SEAT INBOARD ARMREST ADJUSTMENT

Ident.: DSC-25-10-30-00000102.0001001 / 21 MAR 17
Applicable to: ALL

To adjust the inboard armrest, the occupant must turn the knurled knob, located on the bottom surface of the armrest.

PILOT SEAT OUTBOARD ARMREST ADJUSTMENT

Ident.: DSC-25-10-30-00000103.0001001 / 26 NOV 19

The Flight Crew Rest Compartment (FCRC) is a buyer-furnished equipment. This section describes the standard features of the FCRC (as it is stated in the Airbus standard interface specifications). For a description of the systems inside the compartment, refer to the supplier's documentation.
The FCRC is installed between the cockpit wall and the RH Door 1. The FCRC is a rest compartment with the capacity to accommodate one crew member during long haul flight. The FCRC has one separate seat and one folding bunk. Two optional flight crew seats can be installed instead of the folding bunk, and used during taxi, takeoff, and landing.

AIR CONDITIONING

Ident.: DSC-25-12-00019231.0002001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The air supplied to the Flight Crew Rest Compartment (FCRC) is taken from the cabin's air supply. In addition, an independent electrical heating system in the Flight Crew Rest Compartment (FCRC) enables the crew to select the desired FCRC temperature.

COMMUNICATIONS

Ident.: DSC-25-12-00019232.0002001 / 03 OCT 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The FCRC is equipped with a cabin interphone handset, controlled via the CIDS, and a loudspeaker. It allows occupants to communicate with the cockpit, and with the cabin attendants. Passenger entertainment system ◁ is also available.

ELECTRICAL SYSTEM

Ident.: DSC-25-12-00000175.0001001 / 15 FEB 11
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

AC and DC power is provided to the FCRC. A razor socket and PC power outlet are installed.

SMOKE DETECTION

Ident.: DSC-25-12-00019241.0002001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

If smoke is detected, the smoke detection system triggers:
- The Master Warning light and a continuous repetitive chime (CRC) in the cockpit,
- A call light in the cabin, and
- A CRC in the compartment for 30 s, followed by a triple chime in the cabin every 30 s. (*Refer to DSC-26-57-10-10 Flight Crew Rest Compartment*).

LIGHTS

Ident.: DSC-25-12-00019242.0002001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The CIDS controls the dimmable lights via an Additional Attendant Panel. Reading lights and No Smoking/Fasten Seatbelt signs are provided. Emergency lights are connected to the aircraft's emergency lighting system.

OXYGEN

Ident.: DSC-25-12-00019243.0002001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

In case of cabin depressurization, masks are automatically released and can be used if the crew member is either sitting or lying down.

EMERGENCY EQUIPMENT

Ident.: DSC-25-12-00019245.0003001 / 20 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

Two life vests can be found under the FCRC's lower bunk.

DOOR

Ident.: DSC-25-12-00019246.0002001 / 20 MAR 17

The entrance has a locking device and is designed to be unlocked from the outside in case of an emergency. The door must be open and secured during takeoff and landing.

GENERAL

Ident.: DSC-25-14-20-00019233.0004001 / 20 MAR 17
Applicable to: ALL

Since the crew rest compartment is buyer-furnished equipment, only the common features (as stated in the Airbus interface specifications), are described in this section. For a description of the systems inside the compartment, refer to the supplier documentation.
The Lower Deck Mobile Crew Rest (LDMCR) compartment is installed in the most forward section of the lower aft cargo compartment. It is accessible from the cabin via a staircase. Berths are provided to allow the crew to relax on long-range flights.
The LDMCR interfaces with the following aircraft systems:

DOORS

Ident.: DSC-25-14-20-00000749.0001001 / 15 FEB 11
Applicable to: ALL

For normal operation, the LDMCR is accessible through the staircase door and a hatch in the cabin floor. The LDMCR is equipped with an additional emergency hatch to evacuate directly into the cabin.

AIR CONDITIONING

Ident.: DSC-25-14-20-00019248.0003001 / 20 MAR 17
Applicable to: ALL

The air supplied to the LDMCR is a mixture of fresh and recirculated air, taken from the cabin air supply. An air supply isolation valve is installed in the supply duct, that is controlled by the ventilation controller. The valve is closed, when the access hatch is not fully open, or smoke is detected in the LDMCR or aft/bulk cargo compartment.

Note: *Pressing the TEST pushbutton on the CARGO SMOKE panel, or performing the LDMCR internal smoke detection system test, closes the air supply isolation valve.*

An independent electrical heating system is installed in the LDMCR. Temperature control inside the LDMCR allows the selection of a temperature within the range of +20 °C to +25 °C. The heating only operates in flight.

Note: *The LDMCR heating system is lost in case of LGCIU2 or GEN 2 failure.*

COMMUNICATION

Ident.: DSC-25-14-20-00019249.0003001 / 20 MAR 17
Applicable to: ALL

The LDMCR is equipped with an interphone station, an attendant indication panel and additional attendant panels. Passenger address and audio entertainment systems are available.

ELECTRICAL SYSTEM

Ident.: DSC-25-14-20-00019250.0003001 / 20 MAR 17
Applicable to: ALL

AC and DC power is provided to the LDMCR.

SMOKE DETECTION

Ident.: DSC-25-14-20-00017063.0003001 / 21 MAR 17
Applicable to: ALL

Refer to DSC-26-57-10-10 Lower Deck Mobile Crew Rest Compartment.

FIRE PROTECTION

Ident.: DSC-25-14-20-00017084.0003001 / 26 NOV 19
Applicable to: ALL

Refer to DSC-26-57-10-20 Lower Deck Mobile Crew Rest Compartment
The LDMCR is equipped with two portable fire extinguishers ◁ .

LIGHTS

Ident.: DSC-25-14-20-00017085.0003001 / 21 AUG 15
Applicable to: ALL

General illumination is installed. The CIDS controls the general illumination via the two Additional Attendant Panels (AAP). An independent continuous staircase illumination is also installed. Reading lights and No Smoking/Fasten Seat Belt signs are provided. The aircraft emergency lighting system controls and supplies the emergency lights and emergency exit sign, installed in the LDMCR.

OXYGEN

Ident.: DSC-25-14-20-00017086.0003001 / 21 AUG 15
Applicable to: ALL

Chemical oxygen generators are provided in the LDMCR. The aircraft system releases the masks.

NORMAL OPERATIONS

Ident.: DSC-25-14-20-00000754.0001001 / 15 FEB 11
Applicable to: ALL

During taxi, takeoff, and landing the LDMCR must be unoccupied. In flight, if the LDMCR is occupied, the access hatch must stay fully open to ensure that the air supply isolation valve is open.

ABNORMAL OPERATION

Ident.: DSC-25-14-20-00000756.0001001 / 21 AUG 15
Applicable to: ALL

PRESSURE LOSS

In case of pressure loss a high-low chime alerts the occupants for 30 s and the oxygen masks drop down.

LOW AIR FLOW

If insufficient air flow can be provided to the LDMCR, an internal buzzer (minimum 30 s) alerts the occupants to evacuate. The heating system is automatically turned off.

Note: *Pressing the TEST pushbutton on the CARGO SMOKE panel closes the air supply isolation valve that triggers the LOW AIR FLOW warning in the LDMCR.*

LDMCR ISOLATION VALVE FAILURE

If the LDMCR isolation valve is not closed, but both hatches are closed, the “DO NOT OPEN HATCH” sign comes on in the staircase.
If the air supply isolation valve fails in the open position, or if it does not close when commanded, the ECAM caution “COND CRG REST ISOL FAULT” is triggered.

FIRE DETECTION

Ident.: DSC-26-20-10-00000381.0002001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The engines and the APU each have a fire and overheat detection system consisting of :
- Two identical gas detection loops (A and B) mounted in parallel.
- A Fire Detection Unit (FDU).

The gas detection loops consist of :
- Four sensing elements for each engine, located in the pylon nacelle, in the engine core (gearbox and turbine) sections.
- One sensing element in the APU compartment.

When a sensing element is subjected to heat, it sends a signal to the fire detection unit.
As soon as loops A and B detect temperature at a preset level, it triggers the fire warning system.
A fault in one loop (break or loss of electrical supply) does not affect the warning system. The unaffected loop still protects the aircraft.
If the system detects an APU fire while the aircraft is on the ground, it shuts down the APU automatically and discharges extinguishing agent.

FIRE DETECTION

Ident.: DSC-26-20-10-00000381.0004001 / 17 MAR 17
Applicable to: LV-KHT, LV-KHU

The engines and the APU each have a fire and overheat detection system consisting of :
- Two identical gas detection loops (A and B) mounted in parallel.
- A Fire Detection Unit (FDU).

The gas detection loops consist of :
- Five sensing elements for each engine, located in the pylon nacelle, in the engine core, compressor and fan sections.
- One sensing element in the APU compartment.

When a sensing element is subjected to heat, it sends a signal to the fire detection unit.
As soon as loops A and B detect temperature at a preset level, it triggers the fire warning system.
A fault in one loop (break or loss of electrical supply) does not affect the warning system. The unaffected loop still protects the aircraft.
If the system detects an APU fire while the aircraft is on the ground, it shuts down the APU automatically and discharges extinguishing agent.

FIRE EXTINGUISHING

Ident.: DSC-26-20-10-00021202.0001001 / 17 MAR 17
Applicable to: ALL

ENGINES

Each engine has two extinguisher bottles equipped with electrically-operated squibs to discharge their agents. Each squib has a dual electric supply. The flight crew controls the discharge of the extinguisher bottles from the ENG FIRE panel in the cockpit.

APU

The APU has one fire extinguisher bottle that has two electrically-operated squibs to discharge its agent.
The flight crew controls the discharge from the APU FIRE panel in the cockpit.
When an APU fire is detected on the ground, the APU automatically shuts down, and the extinguisher bottle discharges automatically.

FIRE DETECTION AND DETECTION FAULT LOGIC

Ident.: DSC-26-20-10-00021201.0001001 / 17 MAR 17
Applicable to: ALL

Fire detection units process all the warnings and cautions originating in the sensing elements:

- A fire warning appears if:
  - Both loop A and B send a fire signal, or
  - One loop sends a fire signal and the other one is failed, or
  - Breaks occur in both loops within 5 s of each other (flame effect), or
  - A test is performed on the associated FIRE panel
- A loop-fault caution appears if:
  - One loop is failed, or
  - Both loops are failed, or
  - The FDU fails.

ENG FIRE PB-SW

The PB-SW normal position is in, and guarded. When the flight crew pushes it, the PB-SW is released and sends an electrical signal that performs the following for the corresponding engine:

- Silences the aural fire warning
- Arms the fire extinguisher squibs
- Closes the low-pressure fuel valve
- Closes the hydraulic fire shut off valve
- Closes the engine bleed valve
- Closes the pack flow control valve
- Cuts off the FADEC power supply
- Deactivates the IDG.

The red lights come on, regardless of the PB-SW position, whenever the fire warning of the corresponding engine is activated.

Ident.: DSC-26-20-20-10-00021187.0001001 / 10 MAY 22

AGENT 1(2) PB

Both AGENT pbs of an affected engine become active when the flight crew releases the ENG FIRE pb-sw.
A brief push on the PB discharges the corresponding fire agent.

- "SQUIB" comes on white when the flight crew releases the associated ENG FIRE pb-sw to help the flight crew identify the AGENT pb to be activated
- "DISCH" comes on amber when the corresponding fire extinguisher bottle has lost pressure.

Ident.: DSC-26-20-20-10-00021188.0001001 / 10 MAY 22

TEST PB

This PB tests the operation of the fire detection and extinguishing system for the engines.

When pressed:
- A CRC sounds
- The MASTER WARNING lights flash
- The ENG FIRE warning appears on ECAM
- On the ENG FIRE panel:
  - The ENG FIRE pb-sws light up red
  - The SQUIB lights come on white if discharge supplies are available
  - The DISCH lights come on amber
- On the ENG MASTER panel (pedestal):
  - The FIRE lights come on red.

APU FIRE PANEL

Applicable to: ALL

Ident.: DSC-26-20-20-20-00021190.0001001 / 10 MAY 22

APU FIRE PB-SW

The PB-SW normal position is in, and guarded. When the flight crew pushes it, the PB-SW is released and sends an electrical signal that performs the following for the APU:

- Shuts down the APU
- Silences the aural warning
- Arms the squib on the APU fire extinguisher
- Closes the low-pressure fuel valve
- Shuts off the APU fuel pump
- Closes the APU bleed valve and X bleed valve and deactivates the APU generator.

The red lights come on, regardless of the PB-SW position, whenever an APU fire warning is activated.

Ident.: DSC-26-20-20-20-00021191.0001001 / 10 MAY 22

AGENT PB

The APU AGENT pb becomes active when the flight crew releases the APU FIRE pb-sw.
A brief push on the PB discharges the corresponding fire agent.

- "SQUIB" comes on white when the flight crew releases the APU FIRE pb-sw
- "DISCH" comes on amber when the fire extinguisher bottle has lost pressure.

Note: *A red disk, which is outside at the rear of the fuselage, signals that the agent is not discharged overboard due to bottle overpressure.*

Ident.: DSC-26-20-20-20-00021192.0001001 / 10 MAY 22

APU FIRE TEST PB

This PB tests the operation of the APU fire detection and extinguishing system.

When pressed:
- A CRC sounds
- The MASTER WARN light flash
- The APU FIRE warning appears on ECAM.
- On the FIRE panel:
  - The APU FIRE pb-sw lights up red
  - The SQUIB light comes on white if discharge supplies are available
  - The DISCH light comes on amber.

Note: *The automatic shutdown of the APU on ground may occur if the flight crew performs this test for more than 3 seconds.*

Note: *If the fire test is performed on ground with only batteries to supply the electrical network, both of the following apply:*

- *The SQUIB light and DISCH light come on, without ECAM warnings*
- *The red APU FIRE pb-sw light partially comes on, as one of the sets of bulbs is not electrically available.*

APU FIRE LIGHT

The red APU FIRE light comes on and an external warning horn sounds when the system detects an APU fire.
The APU fire extinguisher discharges automatically 3 s after the appearance of the fire warning.
The light goes out when the fire has been extinguished.

Ident.: DSC-26-20-20-40-00021197.0001001 / 17 MAR 17

APU SHUT OFF PB

This pushbutton is guarded.
When there is an APU fire and this button is pressed, it confirms that the APU has shut down automatically and silences the external warning horn.

SMOKE DETECTION

Ident.: DSC-26-30-10-00021204.0001001 / 17 MAR 17
Applicable to: ALL

The smoke detection system of the avionics bay consists of:

- Two smoke detectors, in the air extraction duct of the avionics ventilation system
- A Smoke Detection Control Unit (SDCU) ◁ or a Cabin Intercommunication Data System (CIDS) with a Smoke Detection Function (SDF) ◁ , that receives signals from the smoke detectors, and transmits them to the ECAM.

The avionics smoke warning triggers, if:

- Both smoke detectors detect smoke for more than 5 s, or
- One smoke detector detects smoke for more than 5 s, and the other smoke detector is inoperative.

If smoke is detected in the avionics bay:

- A Repetitive Chime (CRC) sounds
- The MASTER WARNING lights flash
- The ECAM SMOKE AVNCS VENT SMOKE alert triggers
- The SMOKE light, on the VENTILATION panel, comes on.

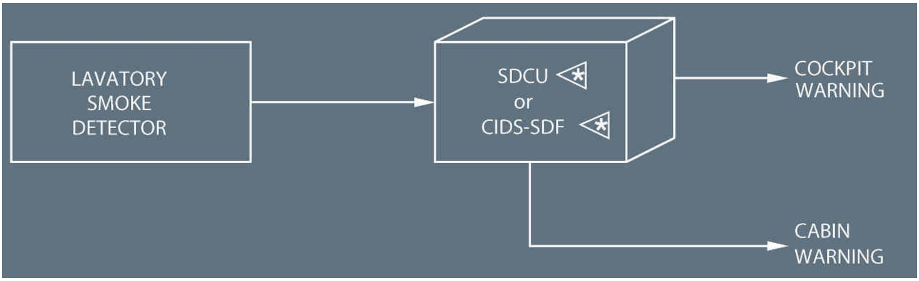
SMOKE DETECTION

Ident.: DSC-26-40-10-00021207.0001001 / 17 MAR 17
Applicable to: ALL

The smoke detection system of the lavatory consists of:

- Smoke detectors, in the air extraction duct of each lavatory
- A Smoke Detection Control Unit (SDCU) ◁ or a Cabin Intercommunication Data System (CIDS) with a Smoke Detection Function (SDF) ◁ that triggers the applicable alerts (cockpit and cabin).

In the case of smoke in a lavatory, the smoke detector sends a signal to the SDCU or the CIDS-SDF, which transmits it to the Flight Warning Computer (FWC) for warning in the cockpit and in the cabin.



WASTE BIN FIRE EXTINGUISHING

Ident.: DSC-26-40-10-00000452.0001001 / 21 MAR 17

There is an automatic fire extinguishing system in the wastebin of each lavatory.

Intentionally left blank

SMOKE DETECTION

Ident.: DSC-26-50-10-10-00021209.0001001 / 31 AUG 18
Applicable to: ALL

The smoke detection system of the cargo compartments consists of:

- Smoke detectors, that are housed in pairs in cavities within the cargo compartment ceiling panels

  There are:
  - Two cavities in the forward cargo compartment
  - Two cavities in the aft cargo compartment
  - One cavity in the bulk cargo compartment.
- A Smoke Detection Control Unit (SDCU) ◁ or a Cabin Intercommunication Data System (CIDS) with a Smoke Detection Function (SDF) ◁ , that receives signals from the smoke detectors, and transmits them to the ECAM.

If smoke is detected in the cargo compartment:

- The Continuous Repetitive Chime (CRC) sounds
- The MASTER WARNING lights flash
- The associated cargo compartment SMOKE alert is triggered
- The COND SD page is displayed
- On the CARGO SMOKE panel, the associated SMOKE light comes on in red.

When the cargo smoke warning triggers, the isolation valves of the cargo ventilation system ◁ of the affected compartment close automatically, and the extraction fan stops.

FIRE EXTINGUISHING

Ident.: DSC-26-50-10-00021210.0003001 / 17 MAR 17
Applicable to: ALL

A fire extinguishing system protects the cargo compartments.
Two fire bottles with two discharge heads, one for each compartment, supply four nozzles:

- Two nozzles in the forward cargo compartment
- One nozzle in the aft cargo compartment
- One nozzle in the bulk cargo compartment.

Pressing the AGENT pb, associated with the FWD (AFT/BULK) compartment, ignites the squib of the two bottles. Bottle 1 discharges its extinguishing agent into that compartment, and then bottle 2.
Bottle 1 discharges in approximately 60 s. A flow metering system controls the discharge of bottle 2, to ensure sufficient agent concentration for 260 min.
The SDCU ◁ or the CIDS-SDF ◁ monitors squib integrity and bottle pressure.
When bottle 1(2) is discharged, the BTL1(BTL2) light comes on white.

The BTL1(2) light comes on white, when the associated bottle has discharged.

Ident.: DSC-26-50-20-10-00021218.0001001 / 17 MAR 17

TEST PB

Tests the operation of the cargo smoke detection system.

When pressed for at least 3 s, and until it is released:
- The smoke detectors in the FWD, AFT, and BULK CARGO compartment and the avionics bay are tested in sequence
- The isolation valves of the cargo ventilation system ◁ close
- BTL1(2) lights come on white

- SQUIB lights come on white, provided that one of the two squib filaments is serviceable
- SMOKE lights (AFT, FWD CARGO, and AVNCS) come on red on the overhead panel, the ECAM displays the associated warnings, and a continuous repetitive chime sounds.

Note: *Each SDCU ◁ channel or SDF ◁ controller generates its own warning, which lasts approximately 25 s, with a delay of approximately 30 s between both. The test is successful if an ECAM smoke warning is triggered at least once for each compartment (avionics bay, forward, aft, and bulk cargo compartments).*

SMOKE DETECTION

Ident.: DSC-26-56-10-00021234.0001001 / 17 MAR 17

- ISPSU ◁ (PED ◁ , seat actuators)
- VCC ◁
- IFEC ◁ .

VCC/IFEC OFF light : Electrical power to VCC ◁ / IFEC ◁ is cut-off.

SMOKE light : When smoke is detected in VCC ◁ / IFEC ◁ , the SMOKE light comes on red, and the ECAM triggers the associated smoke warning.

Note: *ISPSS, seat actuators, and PED ◁ do not generate smoke indication in the cockpit.*

Smoke Detection

LOWER DECK MOBILE CREW REST COMPARTMENT

Ident.: DSC-26-57-10-10-00021236.0001001 / 17 MAR 17
Applicable to: ALL

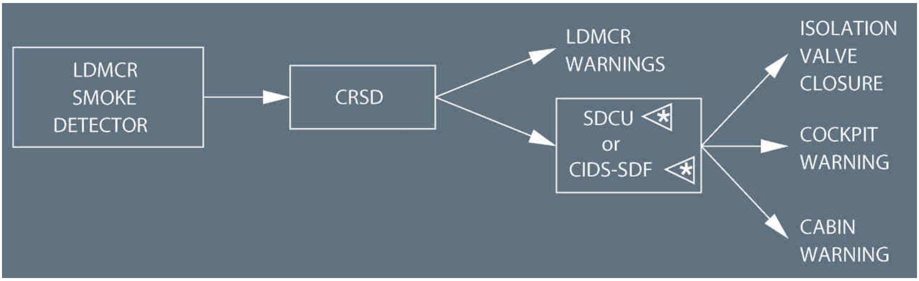
The smoke detection system of the Lower Deck Mobile Crew Rest (LDMCR) consists of:
- Smoke detectors
- A Crew Rest Smoke Detection (CRSD) control unit, located in the LDMCR
- A Smoke Detection Control Unit (SDCU) ◁ or a Cabin Intercommunication Data System (CIDS) with a Smoke Detection Function (SDF) ◁ .

When a detector detects smoke in the LDMCR, it sends a signal to the CRSD, and:
- The horn in the CRSD control unit activates
- The related smoke-detector indicator flashes on the CRSD control unit
- The CRSD control unit sends a smoke signal to the SDCU or the CIDS-SDF.

When the exit and emergency exit hatches are closed, the “DO NOT OPEN HATCH” sign comes on, in the staircase housing.

The SDCU or the CIDS-SDF transmits the smoke signal to:
- The cockpit (ECAM warning)
- The cabin (warning)
- The ventilation controller, which closes the ventilation isolation valve. In the LDMCR, the “LEAVE MCR” sign comes on, the low-flow buzzer activates, a continuous repetitive chime (CRC) sounds during 30 s, and the intensity of the lights increases to 100 %.

Note: *The internal smoke detection system is only available when electrical power is supplied to the LDMCR.*



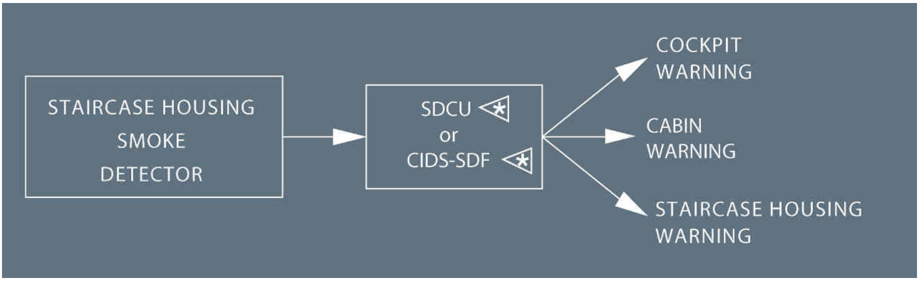
STAIRCASE HOUSING

Ident.: DSC-26-57-10-10-00021239.0002001 / 17 MAR 17
Applicable to: ALL

The smoke detection system of the staircase housing consists of:
- One smoke detector
- A Smoke Detection Control Unit (SDCU) ◁ or a Cabin Intercommunication Data System (CIDS) WITH A Smoke Detection Function (SDF) ◁ .

When the detector senses smoke in the staircase housing, it sends a signal to the SDCU or to the CIDS-SDF, that transmits it to trigger the applicable alerts in the cockpit (warning display) and in the cabin (warning display in the cabin, and visual and aural warning in the staircase housing).

Note: *The internal smoke detection system is only available when electrical power is supplied to the LDMCR.*



FLIGHT CREW REST COMPARTMENT

Ident.: DSC-26-57-10-10-00021240.0002001 / 17 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KAN, LV-KAO, LV-KHT, LV-KHU

The smoke detection system of the Flight Crew Rest Compartment (FCRC) consists of:
- One smoke detector
- A Smoke Detection Control Unit (SDCU) or a Cabin Intercommunication Data System (CIDS) with a Smoke Detection Function (SDF) ◁ .

When the detector senses smoke in the FCRC, it sends a signal to the SDCU or to the CIDS-SDF, which transmits it to the Flight Warning Computer (for a warning display in the cockpit) and to the CIDS (for a warning display in the cabin, and a visual and aural warning in the FCRC).

Note: *The internal smoke detection system is only available when electrical power is supplied to the FCRC.*

GENERAL

Ident.: DSC-27-10-10-00000140.0001001 / 21 MAR 16
Applicable to: ALL

The fly-by-wire system was designed and certified to render the new generation of aircraft even more safe, cost effective, and pleasant to fly.

BASIC PRINCIPLE

Ident.: DSC-27-10-10-00000141.0002001 / 17 MAY 21
Applicable to: ALL

The flight control surfaces are all :
- Electrically-controlled, and
- Hydraulically-actuated.

The stabilizer can also be mechanically-controlled.
Pilots use the sidesticks to fly the aircraft in pitch and roll (and in yaw, indirectly, through turn coordination).
Computers interpret pilot input and move the flight control surfaces, as necessary, to follow their orders.
However, when in normal law, regardless of the pilot's input, the computers will prevent excessive maneuvers and exceedance of the safe envelope in pitch and roll axis.
However, as on conventional aircraft, the rudder has no such protection.

Spoiler control = Electrical

YAW AXIS

Rudder control = Electrical

OTHER CONTROLS

Speedbrakes = Electrical

Note: *All surfaces are hydraulically-actuated.*

COCKPIT CONTROLS

Ident.: DSC-27-10-10-00000158.0002001 / 27 JAN 11
Applicable to: ALL

- Two sidestick controllers are used for pitch and roll manual control. One is on the CAPT's lateral console, the other is on the FO's lateral console.
  The two controllers are springloaded to neutral, and are not mechanically coupled.
  Each controller independently sends electrical signals to the flight control computers.
- Two pairs of rigidly interconnected pedals ensure electrical control of the rudder.
- A speedbrake control lever is provided in the center pedestal.
- Two handwheels, on the center pedestal, are used to mechanically control the THS.
- A switch, installed on the center pedestal, ensures the rudder trim control.
- No manual aileron trim switch is provided.

COMPUTERS

Applicable to: ALL

Ident.: DSC-27-10-10-A-00000159.0001001 / 27 JAN 11

GENERAL

Five flight control computers process pilot and autopilot inputs according to normal, alternate or direct flight control laws.
The computers are:

Ident.: DSC-27-10-10-A-00000160.0003001 / 21 MAR 16

3 PRIM computers

(Flight Control Primary Computer – FCPC), each of which is used for :

- Normal, alternate, and direct control laws.
- Speedbrake and ground spoiler control.
- Protection speed computation.
- Rudder travel limit.

Ident.: DSC-27-10-10-A-00000162.0001001 / 27 JAN 11

2 SEC COMPUTERS

(Flight Control Secondary Computer – FCSC) for :

- Direct control laws, including yaw damper function.
- Rudder trim, and rudder travel limit.

One computer of any type is capable of controlling the aircraft and of assuring safe flight and landing.

In normal operation, one PRIM computer is declared to be the master (P1). It processes the orders and sends them to the other computers (P1 / P2 / P3 / S1 / S2), which will then execute them on their related servo-control.
If one computer is unable to execute the orders sent by the master, another computer executes the task of the affected computer (except for spoiler control).
If the master computer (P1) cannot be the master, then P2 (or P3, if P2 is not available) becomes the master.

Note: *When the green hydraulic system is lost, P2 replaces P1 as the master computer.*

In case all PRIM computers are lost, each SEC is its own master and controls its associated servoloop in direct law.
A single SEC can provide complete aircraft control in direct law.

Ident.: DSC-27-10-10-A-00000172.0004001 / 23 JUN 14

2 FCDC COMPUTERS

The FCDCs acquire data from the PRIMs and SECs and send this data to the EIS and CMC.

Note: *On ground, a spurious "RUD TRV LIM" could be displayed on INOP SYS ECAM status page, in case of one FCDC does not detect its ground condition. This message will disappear as soon as the rudder control is pressurized by hydraulic.*

Ident.: DSC-27-10-10-A-00003939.0001001 / 27 JAN 11

1 BACKUP CONTROL MODULE (BCM) COMPUTER

The BCM computer provides yaw damping, and direct rudder command with pedals, via an independent unit, in case of:
- Total electrical failure, or
- Loss of rudder control due to a Flight Control Computer (PRIM and SEC) failure.

It includes:
- Its own electrical generator, referred to as the Backup Power Supply (BPS), which is supplied by the B or Y hydraulic system
- Its own sensors (gyrometers and pedals deflection)
- Control of the B and Y hydraulic actuators.

When activated, as in yaw alternate law, there is no turn coordination.

SIDESTICK COMMANDS

Two elevators and the trimmable horizontal stabilizer (THS) control the aircraft in pitch. The maximum elevator deflection is 30 ° nose up and 15 ° nose down. The maximum THS deflection is 14 ° nose up and 2 ° nose down.

Ident.: DSC-27-10-20-A-00000187.0001001 / 30 JAN 13

ELECTRICAL CONTROL

- In normal operations, the PRIM 1 controls the elevators and the horizontal stabilizer, and the green hydraulic jacks drive the left and right elevator surfaces.
  The THS is driven by N° 1 of three electric motors.
- If a failure occurs in PRIM 1 or the associated hydraulic systems or hydraulic jacks, the system shifts pitch control to PRIM 2. PRIM 2 then controls the elevators via the blue and yellow hydraulic jacks and controls the THS via the N° 2 electric motor.
- If neither PRIM 1 nor PRIM 2 are available, the system shifts pitch control to SEC 1 for elevator control, and to PRIM 3 for THS control via the N° 3 electric motor.
- In case of 3 PRIM failure, SEC 1 controls the elevator. Electrical control of THS is lost. THS actuation is still available through manual pitch trim wheel control.

Ident.: DSC-27-10-20-A-00000188.0001001 / 21 MAR 16

MECHANICAL CONTROL

Mechanical control of the THS is available from the pitch trim wheel, at any time, if either the blue or the yellow hydraulic system is functioning.
Mechanical control from the pitch trim wheel has priority over electrical control.

Ident.: DSC-27-10-20-A-00000212.0001001 / 21 MAR 16

ACTUATION

Elevators

- Two electrically controlled hydraulic servojacks drive each elevator.

  Each servojack has three control modes :
  - Active : Jack position is electrically controlled.
  - Damping : Jack follows surface movement.
  - Centering : Jack is hydraulically maintained in neutral position.
- In normal operation:
  - One jack is in active mode.
  - The other jack is in damping mode.
  - Some maneuvers cause the second jack to become active.
- If the active servojack fails, the damped one becomes active and the failed jack is automatically switched to the damping mode.
  If neither jack is being controlled electrically nor hydraulically, both are automatically switched to the damping mode.
  If neither of the four jacks is being controlled electrically, the four jacks are automatically switched to the centering mode.

Stabilizer

- A screwjack driven by two hydraulic motors drives the stabilizer.
- The two hydraulic motors are controlled by :
  - one of three electric motors, or
  - the mechanical trim wheel.

SIDESTICK COMMANDS

Two ailerons and five spoilers on each wing control the aircraft about the roll axis.
The maximum deflection of the ailerons is 25 °.
Ailerons extend when the flaps are extended (aileron droop).
The maximum spoiler deflection is 35 °.

Ident.: DSC-27-10-20-B-00000216.0001001 / 21 MAR 16

ELECTRICAL CONTROL

- Inner ailerons are normally controlled by PRIM 1 (LH) and 2 (RH) with each of these computers being capable of controlling both sides. SEC 1 and 2 provide the back up control in case of PRIM 1 and 2 failure.
- The outboard ailerons are normally controlled by PRIM 3. SEC 1 and 2 provide the backup control in case of PRIM 3 failure.
- The SECs control the N° 3 and 6 spoilers ; the PRIMs control the N° 2, 4 and 5 spoilers.

Ident.: DSC-27-10-20-B-00000223.0001001 / 21 MAR 16

ACTUATION

AILERONS

Two electrically-controlled hydraulic servojacks drive each aileron.

Each servojack has two control modes :
- Active : Jack position is electrically controlled.
- Damping : Jack follows surface movement.

The system automatically selects damping mode, in the event of green and yellow or blue and green low pressure, or if the respective computer fails.
At high speed (above 190 kt, in CONF 0), the outboard ailerons are controlled to zero deflection.
In some failure cases, in autopilot mode, the outboard ailerons are used up to 300 kt.
When the emergency generator is only supplied by the RAT, the outer ailerons are controlled in damping mode to reduce hydraulic power consumption.

SPOILERS

A servojack positions each spoiler. Each servojack receives hydraulic power from either the green, yellow, or blue hydraulic system, controlled by the PRIM or SEC (*Refer to DSC-27-10-20 Speedbrake and Ground Spoiler Control - Roll Control-Schematic*).
The system automatically retracts the spoilers to their zero position, if it detects a fault or loses electrical control.
If the system loses hydraulic pressure, the spoiler retains the deflection it had at the time of the loss, or a lesser deflection if aerodynamic forces push it down.
When a spoiler surface on one wing fails, the symmetric one on the other wing is inhibited (except for spoilers 4 and 6).

SPEEDBRAKE AND GROUND SPOILER CONTROL

Applicable to: ALL

Ident.: DSC-27-10-20-C-00000234.0005001 / 10 MAY 21

SPEED BRAKE CONTROL

The flight crew controls the speedbrakes with the speedbrake control lever.
The speedbrakes are spoilers 1 to 6.

Speedbrake extension is inhibited, if:
- MLA is activated, or
- Angle-of-attack protection is active, or
- Low speed stability is active, or
- At least one thrust lever is above MCT position, or
- Alpha floor is activated.

If an inhibition occurs when the speedbrakes are extended, they automatically retract and stay retracted until the inhibition condition disappears, and the flight crew resets the lever (the speedbrakes can be extended again, 5 s after the lever is reset). When a speedbrake surface on one wing fails, the symmetric speedbrake surface on the other wing is inhibited.

L2 The maximum deflection for the spoilers is:
- 25 ° for spoiler 1
- 30 ° for spoilers 2 to 6.

The maximum deflection for the spoilers is reduced in CONF 2, 3 and FULL.
For surfaces 2 to 6 (that perform roll and speedbrake functions), the roll function has priority: When the sum of a roll order and a simultaneous speedbrake order on one surface is more than the maximum deflection achievable in flight, the symmetric speedbrake on the other wing is retracted until the difference between the two surfaces is equal to the roll order.

Ident.: DSC-27-10-20-C-00000239.0004001 / 17 OCT 17

GROUND SPOILER CONTROL

Spoilers 1 to 6 act as ground spoilers.
When a ground spoiler surface on one wing fails, the symmetric one on the other wing is inhibited.

ARMING

The pilot arms the ground spoiler function by pulling the speedbrake control lever up into the armed position.

FULL EXTENSION - REJECTED TAKEOFF PHASE

- If the ground spoilers are armed and the wheel speed exceeds 72 kt, the ground spoilers will automatically extend as soon as all thrust levers are set to idle.
- If the ground spoilers are not armed and the wheel speed exceeds 72 kt, the ground spoilers will automatically extend as soon as reverse is selected on at least one engine (remaining engine at idle).

FULL EXTENSION - LANDING PHASE / BOUNCE

- If the ground spoilers are armed and all thrust levers are at idle, the ground spoilers will automatically extend as soon as both main landing gears have touched down.
- If the ground spoilers are not armed and both main landing gears have touched down, the ground spoilers will automatically extend as soon as reverse is selected on at least one engine (remaining engine at idle).

PARTIAL EXTENSION

The ground spoilers partially extend when reverse is selected on at least one engine (other engine at idle) and one main landing gear is compressed.
This partial extension, by decreasing the lift, will ease the compression of the second main landing gear, and consequently will lead to the normal ground spoiler extension.

RETRACTION

The ground spoilers retract when:
- One thrust lever is above idle, or
- All thrust levers are at forward idle, and the speedbrake control lever is pushed down.

ELECTRICAL RUDDER CONTROL

- In normal operation, PRIM 1 controls the green hydraulic servo control, PRIM 2 controls the blue hydraulic servo control, and PRIM 3 controls the yellow hydraulic servo control.
- If all the 3 PRIMs fail, SEC 1 controls the green hydraulic servo control.
- In case of a total electrical failure, or loss of rudder control due to flight control computers failure, the Backup Control Module (BCM) controls the yellow hydraulic servo control, or the blue hydraulic servo control, if the yellow hydraulic servo control is not available.

Ident.: DSC-27-10-20-D-00000253.0002001 / 04 MAR 14

RUDDER ACTUATION

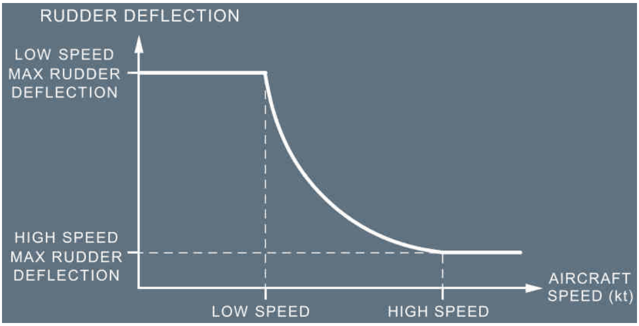
The rudder is actuated by 3 independent hydraulic servo controls operating in parallel.

- In normal operation, the 3 servo controls are simultaneously in active mode.
- In case of an electrical or hydraulic failure, the corresponding servo control is in damping mode.

Ident.: DSC-27-10-20-D-00000255.0003001 / 19 MAR 14

RUDDER TRAVEL LIMIT

The maximum rudder travel deflection gradually reduces as the speed increases, to avoid high structural loads :



In the case of a failure that causes loss of the Rudder Travel Limit function, the rudder deflection limit stops at the last value reached. At slats' extension, full rudder authority is recovered.
In all cases, the available rudder deflection provides sufficient yaw control within the entire flight envelope. This includes the case of maximum asymmetric thrust.

Ident.: DSC-27-10-20-D-00015248.0002001 / 04 MAR 14

RELATIONSHIP BETWEEN SIDESLIP/RUDDER DEFLECTION/ RUDDER PEDAL TRAVEL

Regardless of the aircraft speed, therefore the maximum rudder deflection, full rudder pedal travel remains available. However, except at low speed, maximum rudder deflection is achieved before reaching maximum rudder pedal travel.

Ident.: DSC-27-10-20-D-00000256.0005001 / 04 MAR 14

RUDDER TRIM

Inside the PFTU, artificial feel and rudder trim are achieved by two electric motors that position the artificial feel unit. In normal operation SEC 1/MOTOR 1 operate with SEC 2/MOTOR 2 synchronized as a backup.

In manual flight, the pilot can apply rudder trim via the RUD TRIM rotary switch located on the pedestal.
A button is provided on the RUD TRIM panel to reset the rudder trim to zero.

Note: *With the autopilot engaged, rudder trim orders are computed by PRIM and transmitted to the SEC for actuation. The rudder trim switch and the rudder trim reset pushbutton are not active.*

One of the PF's primary tasks is to maintain the aircraft within the limits of the normal flight envelope. However, some circumstances, due to extreme situations or aircraft mishandling, may provoke the violation of these limits.

Despite system protections, the PF must not deliberately exceed the normal flight envelope. In addition, these protections are not designed to be structural limit protections (e.g. opposite rudder pedal inputs). Rather, they are designed to assist the PF in emergency and stressful situations, where only instinctive and rapid reactions will be effective.

Protections are intended to:

- Provide full authority to the PF to consistently achieve the best possible aircraft performance in extreme conditions
- Reduce the risks of overcontrolling, or overstressing the aircraft
- Provide PF with an instinctive and immediate procedure to ensure that the PF achieves the best possible result.

Pitch Control

GROUND MODE

Ident.: DSC-27-20-10-20-00000269.0003001 / 21 MAR 16
Applicable to: LV-GKO, LV-GKP, LV-KAN, LV-KAO

Ground mode is active on ground. It is a direct relationship between the sidestick deflection and elevator deflection without auto trim. The THS is automatically set at 4 ° up (inside the green band). Manual setting according to CG has priority for take off.
The rotation maneuver is flown in direct law, with full authority.
Immediately after the aircraft becomes airborne, the flight mode is progressively blended in. The reverse process occurs after touchdown.

GROUND MODE

Ident.: DSC-27-20-10-20-00000269.0004001 / 16 MAR 11
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-KHT, LV-KHU

Ground mode is active on ground. It is a direct relationship between sidestick deflection and elevator deflection without auto trim.
The THS is automatically set at 4 ° UP (inside the green band). Before departure, as soon as the three hydraulic systems are available, the THS is automatically set to the takeoff value, calculated by the PRIM, according to the ZFWCG entered in the MCDU and the fuel distribution. This automatic setting occurs only one time, and the flight crew can override it at any time.
The rotation maneuver is flown in direct law, with full authority.
Immediately after the aircraft becomes airborne, the flight mode is progressively blended in. The reverse process occurs after touchdown.

FLIGHT MODE

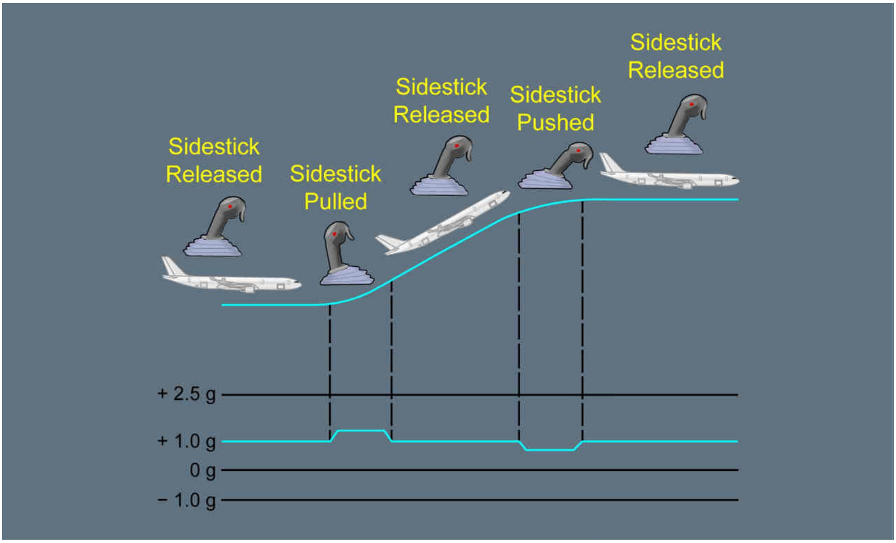
Applicable to: ALL

Ident.: DSC-27-20-10-20-A-00000271.0001001 / 17 MAR 17

GENERAL

The normal law flight mode is a load factor demand law with auto trim and full flight envelope protection.
In manual flight, it provides elevator and THS control from the sidestick controllers to achieve a load factor proportional to stick deflection, independent of speed.
With the sidestick at neutral and the wings level, the system maintains 1 g in pitch corrected for pitch attitude. There is no need for the pilot to trim with speed or configuration changes. Therefore pilots only need to perform minor corrections on the sidestick, if the aircraft deviates from its intended flight path. If the pilot senses an overcontrol, the sidestick should be released.

Airbus Pitch Characteristic



With the autopilot engaged, it provides elevator and THS control according to autopilot and load factor demand. Pitch trim is automatic in both manual and autopilot mode.
In normal turns (up to 33 ° of bank), no pitch correction is required once the turn is established.
The flight mode is active from takeoff to landing, according to the logic (*Refer to DSC-27-20-10-10 General*).

Automatic pitch trim is frozen in the following cases:
- Manual trim order
- Radio height below 100 ft for flare
- Load factor lower than 0.5 g
- In high speed protection.

When the angle of attack protection is active, the THS is limited between setting at entry in protection and 2 ° nose down (i.e. further nose up trim cannot be applied).
Similarly, when the load factor is higher than 1.3 g, or when the bank angle is outside ± 33 °, the THS is limited between the actual setting and 2 ° nose down.

Ident.: DSC-27-20-10-20-A-00000270.0001001 / 21 MAR 16

CONTROL WITH AUTOPILOT ENGAGED

- The autopilot orders are limited by the PRIM
- A force must be overcome to move the sidestick with the autopilot engaged. If the pilot moves the sidestick to overcome this force, the autopilot will disconnect.
- All protections remain effective.

FLARE MODE

Ident.: DSC-27-20-10-20-00000273.0001001 / 21 MAR 16
Applicable to: ALL

When the aircraft passes 100 ft RA, the THS is frozen and the normal flight mode changes to flare mode as the aircraft descends to land. Flare mode is essentially a direct stick-to-elevator relationship (with some damping provided by the load factor and the pitch rate feedbacks). At 50 ft, a slight pitch down elevator order is applied. Consequently, to flare the aircraft, a gentle nose-up action by the pilot is required.

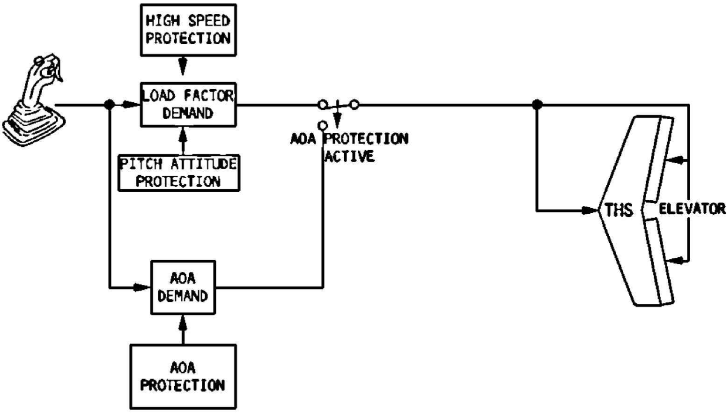
PROTECTIONS

Applicable to: ALL

Ident.: DSC-27-20-10-20-B-00000275.0001001 / 21 MAR 16

GENERAL

The normal law provides complete flight envelope protection as follow :
- Load factor limitation
- Pitch attitude protection
- High angle of attack (AOA) protection
- High speed protection



HIGH SPEED PROTECTION
LOAD FACTOR DEMAND
PITCH ATTITUDE PROTECTION
AOA PROTECTION ACTIVE
AOA DEMAND
AOA PROTECTION

ELEVATOR

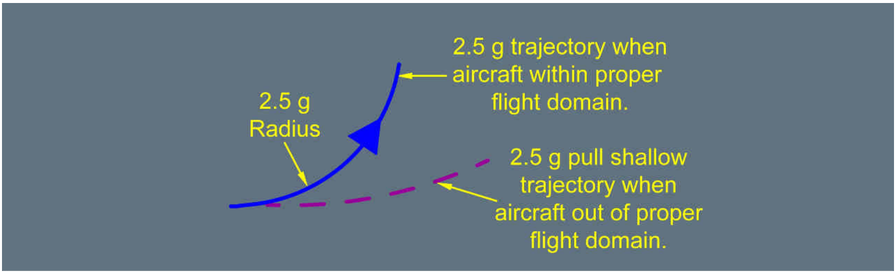
Ident.: DSC-27-20-10-20-B-00000276.0001001 / 17 MAR 17

LOAD FACTOR LIMITATION

On commercial aircraft, high load factors can be encountered during evasive maneuvers due to potential collisions, or CFIT …
Pulling "g" is efficient, if the resulting maneuver is really flown with this "g" number. If the aircraft is not able to fly this trajectory, or to perform this maneuver, pulling "g" will be detrimental.

The load factor is automatically limited to :
+2.5 g to -1 g, slats retracted
+2 g to 0, slats extended

Airbus Load Factor Protection and Safety



2.5 g trajectory when aircraft within proper flight domain.
2.5 g Radius
2.5 g pull shallow trajectory when aircraft out of proper flight domain.

On most commercial aircraft, the potential for an efficient 2.5 g maneuver is very remote. Furthermore, as G Load information is not continuously provided in the cockpit, airline pilots are not used to controlling this parameter. This is further evidenced by inflight experience, which

reveals that: In emergency situations, initial PF reaction on a yoke or sidestick is hesitant, then aggressive.
With load factor protection, the PF may immediately and instinctively pull the sidestick full aft: The aircraft will initially fly a 2.5 g maneuver without losing time. Then, if the PF still needs to maintain the sidestick full aft stick, because the danger still exists, then the high AOA protection will take over. Load factor protection enhances this high AOA protection.
Load factor protection enables immediate PF reaction, without any risk of overstressing the aircraft.
Flight experience has also revealed that an immediate 2.5 g reaction provides larger obstacle clearance, than a hesitant and delayed high G Load maneuver (two-second delay).

Ident.: DSC-27-20-10-20-B-00000278.0001001 / 17 MAR 17

PITCH ATTITUDE PROTECTION

Excessive pitch attitudes, caused by upsets or inappropriate maneuvers, lead to hazardous situations:

- Too high a nose-up ▸ Very rapid energy loss
- Too low a nose-down ▸ Very rapid energy gain

Furthermore, there is no emergency situation that requires flying at excessive attitudes. For these reasons, pitch attitude protection limits pitch attitude to plus 30 °/minus 15 °.
Pitch attitude protection enhances high speed protection, high load factor protection, and high AOA protection.

Ident.: DSC-27-20-10-20-B-00000280.0005001 / 04 MAY 23

HIGH ANGLE-OF-ATTACK PROTECTION

In normal law, the aircraft is protected against stall, in dynamic maneuvers or gusts. When the current angle-of-attack becomes greater than αPROT, the high angle-of-attack (AOA) protection activates.
Without the flight crew input, the F/CTL computers will maintain the angle-of-attack equal to αPROT. The AOA can be further increased by the flight crew input, up to a maximum value equals to αMAX. When the High AOA protection is activated, the normal law demand is modified and the side stick input is an angle-of-attack demand, instead of a load factor demand.
The PF must not deliberately fly the aircraft in the High AOA, except for brief periods, when the maximum maneuvering speed is required.

minimum allowed speed

Vα PROT, Vα MAX, and αfloor condition are mainly computed based on the AOA, and therefore they vary with configuration, weight and load factor. The Vα PROT and Vα MAX, displayed on the PFD, are computed by the PRIM. The αfloor activation logic is provided by the PRIM.
Refer to DSC-22_10-50-20 Characteristic Speeds for more information.
The angle-of-attach will not exceed αMAX, even if the flight crew gently pulls the sidesitck all way back. The flight crew can hold full back stick, if it is needed, and the aircraft stabilizes at an angle-of-attack close to but less of the 1 g stall. When flying at the αMAX, the PF can make gentle turns, if necessary. If the flight crew releases the sidestick, the angle-of-attack returns to the αPROT and stays there. As the aircraft enters the protection at the amber and blacks trip (αPROT), the system inhibits further nose-up trim beyond the point already reached. The nose-down trim remains available, if the flight crew pushes the stick forward.

Note: *At takeoff, the αPROT is equal to the αMAX for 8 s.*

This High AOA protection has priority over all other protections.
The aircraft can also enter αPROT at a high level, where it protects the aircraft from the buffet boundary. As at the low speed or low level, if the sidestick is merely released to neutral, the aircraft maintains the alpha for αPROT. This value of alpha is not the same as the value used at the low speed. The alpha for αPROT is reduced as a function of Mach, therefore, the aircraft may climb with the sidestick fee, when leaving a turn after entering αPROT.

If the flight crew flies into αPROT, the flight crew should leave it as soon as other considerations allow, by easing forward on the sidestick to reduce alpha below the value of αPROT, while simultaneously adding power (if the αfloor has not yet been activated, or has been cancelled).

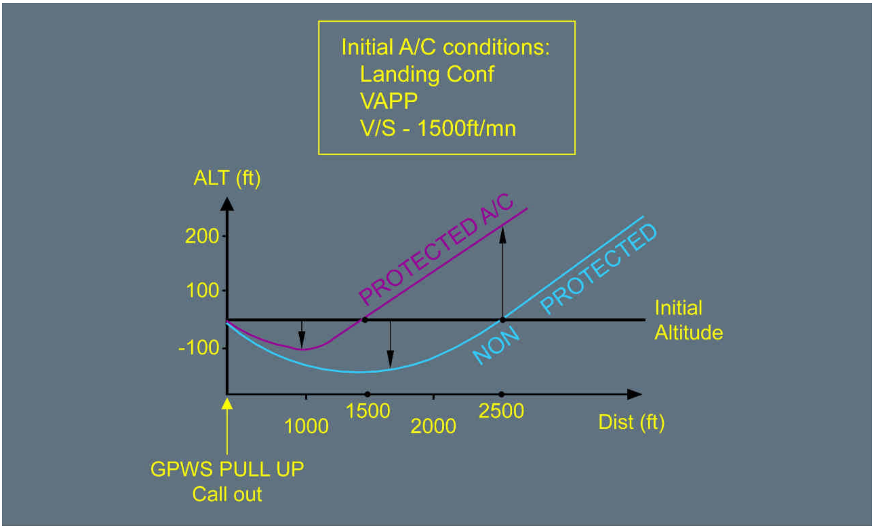
The aircraft leaves angle-of-attack protection when the:
- Sidestick is pushed more than 8 ° forward, or
- Sidestick is pushed more than 0 ° forward for at least 1 s, when α < αMAX, or
- The sidestick is at neutral or pushed forward, for at least 0.5 s, when α < αPROT.

Between αPROT and αMAX, the αfloor protection may automatically set go-around thrust. The αfloor will usually be triggered just after entering the αPROT, and go-around thrust will automatically be applied. Therefore, if the sidestick is held aft, either inadvertently or deliberately, the aircraft will start to climb at a relatively constant low airspeed. To recover a normal flight condition, the αPROT should be exited by easing forward on the sidestick, as described above, and the αfloor should be cancelled by using the disconnect pushbutton on either thrust lever as soon as a safe speed is regained. *Refer to DSC-22_30-50-50 ALPHA FLOOR* for more information.

GPWS/WINDSHEAR CASE:

In the case of application of GPWS or windshear procedures, the aircraft protections provide maximum lift / maximum thrust / minimum drag. Therefore, CFIT escape maneuvers will be much more efficient.

Protected A/C Versus Non-protected A/C Go-around Trajectory



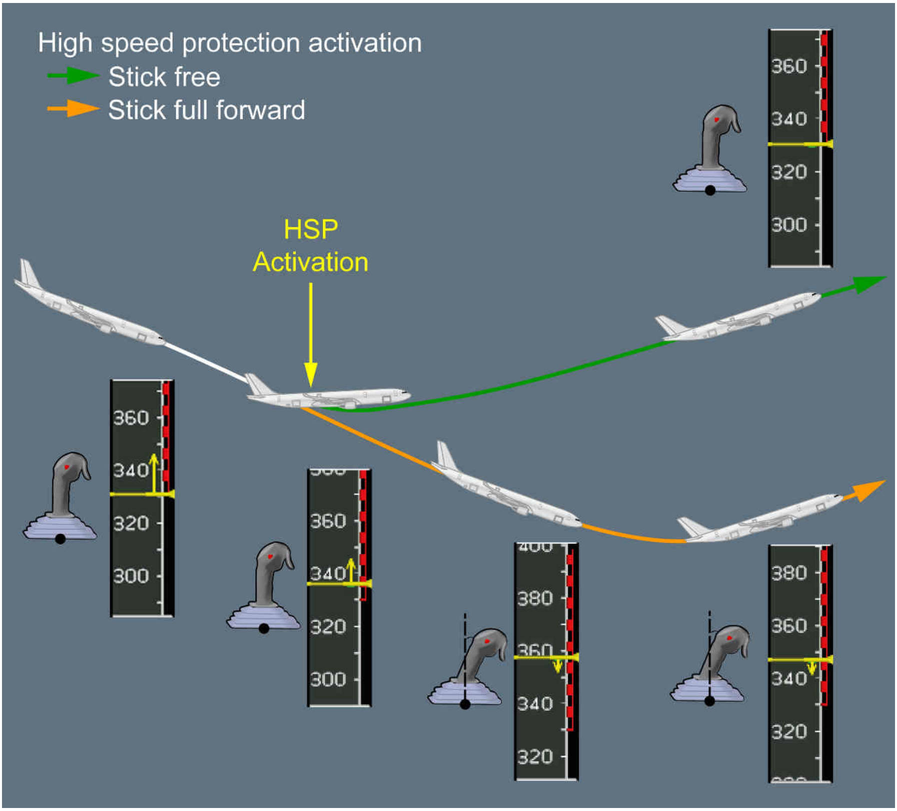
The above-illustrated are typical trajectories flown by protected or not protected aircraft, when the PF applies the escape procedure after an aural " GPWS PULL UP" alert.
The graph demonstrates the efficiency of the protection, to ensure a duck-under that is 50 % lower, a bucket-distance that is 50 % shorter, a safety margin that more than doubles (due to a quicker reaction time), and a significant altitude gain (± 250 ft). These characteristics are common to all protected aircraft, because the escape procedure is easy to achieve, and enables the PF to fly the aircraft at a constant AOA, close to the max AOA. It is much more difficult to fly the stick shaker AOA on an aircraft that is not protected.

Ident.: DSC-27-20-10-20-B-00000281.0001001 / 17 MAR 17

HIGH SPEED PROTECTION

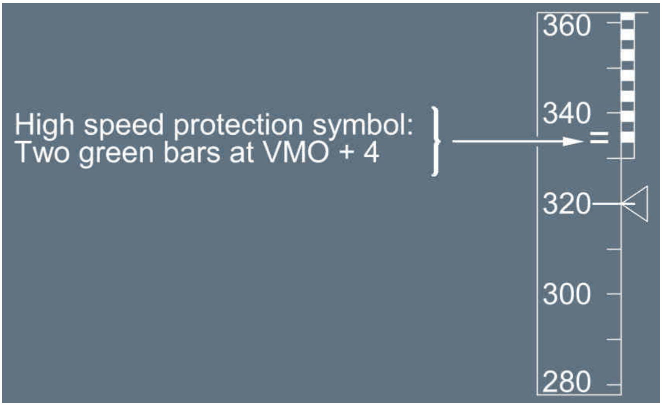
The aircraft automatically recovers following a high speed upset. Depending on the flight conditions (high acceleration, low pitch attitude), the High Speed Protection is activated at/or above VMO/MMO.
When it is activated, the pitch trim is frozen. Positive spiral static stability is introduced to 0 ° bank angle (instead of 33 ° in normal law), so that with the sidestick released, the aircraft always returns to a bank angle of 0 °. The bank angle limit is reduced from 67 ° to 45 °.
As the speed increases above VMO/MMO, the sidestick nose-down authority is progressively reduced, and a permanent nose-up order is applied to aid recovery to normal flight conditions.

Therefore, in a dive situation:
- If there is no sidestick input, the aircraft will slightly overshoot VMO/MMO and fly back towards the envelope.
- If the sidestick is maintained full forward, the aircraft will significantly overshoot VMO/MMO. At approximately VMO +16/MMO +0.04, the pitch nose-down authority smoothly reduces to zero (which does not mean that the aircraft stabilizes at that speed).



High speed protection activation
Stick free
Stick full forward
HSP
Activation
360
340
320
300
380
400

The PF, therefore, has full authority to perform a high speed/steep dive escape maneuver, when required, via a reflex action on the sidestick.
The High Speed Protection is deactivated when the aircraft speed decreases below VMO/MMO, where the usual normal control laws are recovered.
The autopilot disconnects at VMO +12 kt and MMO + 0.03.



Note: *1. An OVERSPEED ECAM warning is provided at VMO + 4 kt and MMO + 0.006.*
2. At high altitude, this may result in activation of the angle of attack protection.

Ident.: DSC-27-20-10-20-B-00000282.0001001 / 17 MAR 17

LOW ENERGY AURAL ALERT

A low energy aural alert “SPEED SPEED SPEED” repeated every 5 s indicates to the pilot that the aircraft energy becomes lower than a threshold under which to recover a positive flight path angle through pitch control, the thrust must be increased.
It is available in configuration 2, 3 and full between 100 and 2 000 ft.

For example, if the aircraft decelerates at 1 kt/sec, and:
- The FPA is -3 °, the alert will trigger at approximately VLS -8,
- The FPA is -4 °, the alert will trigger at approximately VLS -2.

This alert draws the PF's attention to the SPEED scale, and indicates the need to adjust thrust.
It comes immediately before the ALPHA Floor.

The low energy aural alert is computed by the PRIM's from the following inputs:
- Aircraft configuration
- Air speed deceleration rate
- Flight path angle

It is inhibited when:
- TOGA is selected
- Below 100 ft RA
- Above 2 000 ft RA
- Alpha floor or GPWS alert is triggered

- In alternate or direct law
- If both RA are failed

The low energy aural alert is triggered during deceleration before alpha floor (unless alpha floor is triggered by stick deflection), the delay between the two alerts depends on deceleration rate.

Lateral Control

LATERAL NORMAL LAW

Ident.: DSC-27-20-10-30-00000312.0002001 / 03 NOV 23
Applicable to: ALL

When the aircraft is on ground, the sidestick commands the aileron and the deflection of the roll spoiler surfaces deflection. The amount of control surface deflection that results from a given amount of sidestick deflection depends on the aircraft speed. The pedals control rudder deflection. The aircraft smoothly transitions to flight mode shortly after liftoff.
When the aircraft is in the flight mode, normal law combines the controls of the ailerons, spoilers (except spoilers 1), and rudder (for turn coordination) in the sidestick. The flight crew does not need to use rudder for turn coordination purpose. While in manual flight the flight crew controls the roll and heading, the flight control system automatically limits the roll rate and the bank angle, ensures turn coordination and damps the dutch roll.
The roll rate requested by the flight crew during flight is proportional to the sidestick deflection, with a maximum rate of 15 °/s when the sidestick is in full deflection. When the aircraft is in flare mode, the lateral control is the same as in flight mode.
During decrab phase, the aircraft limits the induced roll after pedal input, in order to ease flight crew control.
After touchdown, the aircraft smoothly transitions from flight mode to ground mode.

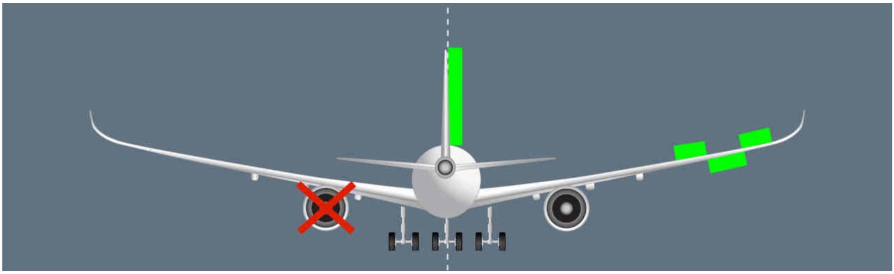
ENGINE FAILURE AT TAKEOFF

In the case of an engine failure during takeoff, the spoiler 6 and ailerons can be deflected on the wing opposite to the failed engine in order to increase yaw efficiency.

Note: *Increasing yaw efficiency in the case of an engine failure on ground, reduces the VMCG, and therefore increases the takeoff performance.*

L2 The spoiler 6 and ailerons will be deflected when:
- Pedal order is more than 2/3 of full pedal deflection
- The aircraft is on ground
- The pitch attitude is below 2.5 °
- The speed is above 60 kt
- Ground spoilers are not activated.

Engine failure at takeoff



BANK ANGLE PROTECTION

Ident.: DSC-27-20-10-30-00000313.0002001 / 17 MAR 17
Applicable to: ALL

Inside the normal flight envelope, the system maintains positive spiral static stability for bank angles above 33 °. If the pilot releases the sidestick at a bank angle greater than 33 °, the bank angle automatically reduces to 33 °. Up to 33 °, the system holds the roll attitude constant when the sidestick is at neutral. If the pilot holds full lateral sidestick deflection, the bank angle goes to 67 ° and no further.

33°
Pitch and bank
remain constant
Return
to 33°
Return
to 33°
67°
Bank Angle
Limit
67°
Bank Angle
Limit

During a normal turn (bank angle less than 33 °), in level flight:
- The PF moves the sidestick laterally (the more the sidestick is moved laterally, the greater the resulting roll rate - e.g. 15 °/s at max deflection)
- It is not necessary to make a pitch correction
- It is not necessary to use the rudder.

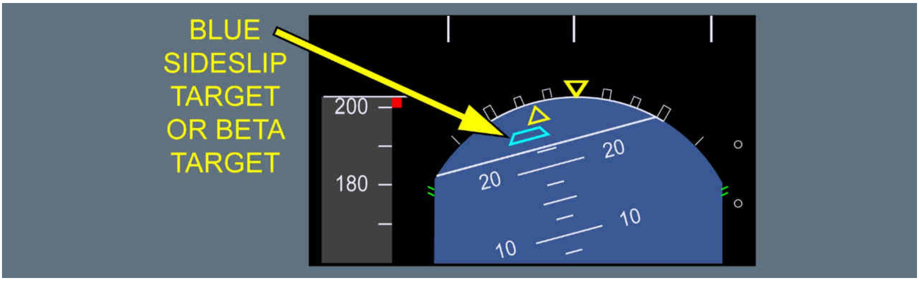
In the case of steep turns (bank angle greater than 33 °), the PF must apply:
- Lateral pressure on the sidestick to maintain bank
- Aft pressure on the sidestick to maintain level flight.

If angle-of-attack protection, or high speed protection, or negative pitch attitude protection is operative, the bank angle will not go beyond 45 °, when the pilot maintains full lateral deflection on the sidestick. If high speed protection is operative, the system maintains positive spiral static stability from a bank angle of 0 °, so that with the sidestick released, the aircraft always returns to a bank angle of 0 °.
When bank angle protection is active, auto trim is inoperative.
If the bank angle exceeds 45 °, the autopilot disconnects and the FD bars disappear. The FD bars return when the bank angle decreases to less than 40 °.

SIDESLIP TARGET

Ident.: DSC-27-20-10-30-00000314.0001001 / 17 MAR 17
Applicable to: ALL

Should an engine failure occur, the sideslip indication is slightly modified to ensure that optimum pilot rudder application is made to achieve optimum climb performance (ailerons to neutral and spoilers retracted).
In the case of an engine failure at takeoff, or at go-around, the sideslip index on the PFD changes from yellow to blue (*Refer to DSC-31-40 Attitude Data* that provides the conditions for the blue display of the sideslip target).



In flight, the lateral normal law commands some rudder surface deflection to minimize the sideslip.

Crew response is normal and instinctive:
- Zero, the beta target value for optimum performance with appropriate rudder application
- Accelerate if beta target cannot be zeroed with full rudder.

The computation is made by the PRIM.

Maneuver Load Alleviation (MLA)

MANEUVER LOAD ALLEVIATION (MLA)

Ident.: DSC-27-20-10-40-00000320.0001001 / 21 MAR 16
Applicable to: ALL

The purpose of MLA is to redistribute the lift over the wing to relieve structural loads on the outer wing surfaces (bending moment).
The demanded load factor is maintained.
MLA utilises spoilers 4, 5, and 6 and the ailerons.

The MLA becomes active when the sidestick is pulled more than 8 °, and the load factor is more than 2 g, in which case :
- The ailerons are symmetrically-deflected upwards :
  - Maximum of 11 ° is added to roll demand, if any.
- Spoilers 4, 5, 6 are symmetrically-deflected :
  - Maximum of 9 ° is added to roll demand, if any.
  - Deflection is proportional to load factor, in excess of 2 g.
- An elevator demand is simultaneously applied to compensate for the pitching moment induced by spoilers and ailerons.

The load alleviation is only available, when :
- The aircraft speed is above 250 kt.
- The FLAPS lever is in the 0 position.
- In normal or alternate law flight mode.

The MLA has priority over the speedbrakes.

Intentionally left blank

Turbulence Damping Function

TURBULENCE DAMPING FUNCTION

Ident.: DSC-27-20-10-60-00000322.0001001 / 21 MAR 16
Applicable to: ALL

The purpose of the turbulence damping function is to damp the structural modes induced by atmosphere turbulence.
The function uses the Nz accelerometer and two dedicated Ny accelerometers. The PRIMs compute a turbulence damping command, which is added to the normal law command for the elevator and the yaw damper.
This function is automatically monitored and becomes inoperative for the remainder of the flight, when a failure is detected. In addition, it may be manually inhibited by switching off the TURB DAMP pushbutton on the overhead panel, when it is considered that comfort is degraded instead of being improved, and no failure is detected.

It is only available if the following conditions are met :
- Aircraft in flight.
- Aircraft speed greater than 200 kt.
- Autopilot engaged or normal law active.
- Aircraft within the normal flight envelope.

Intentionally left blank

Enhanced Load Alleviation Function (ELAF)

ENHANCED LOAD ALLEVIATION FUNCTION (ELAF)

Ident.: DSC-27-20-10-70-00016092.0001001 / 24 FEB 15
Applicable to: LV-GHQ, LV-GIF

The enhanced load alleviation function permits to alleviate the wing structure loads.
The function is achieved through the upward deflection of the two pairs of ailerons only.

The ELAF is activated:
- when airbrakes are extended, or
- In case of turbulence when load factor variation rate is excessive.

The ELAF is available when the aircraft is in clean configuration and in Normal law. The ELAF orders are added to those generated by the normal law.

Intentionally left blank

Aircraft Trimming

GENERAL

Ident.: DSC-27-20-10-80-00001960.0002001 / 10 DEC 09
Applicable to: ALL

When the aircraft is :
- In normal cruise range,
- In straight flight,
- With the autopilot engaged,
- With symmetrical engine thrust, and
- With fuel in the wing tanks distributed symmetrically,

the rudder trim should stay between 1.9 ° right and 1.6 ° left.

Note: *This indication corresponds to a true rudder deflection within ± 1 °, taking into account the permanent offset of rudder trim indication when the aircraft is in cruise conditions (0.9 ° right, 0.6 ° left).*

Intentionally left blank

General

GENERAL

Ident.: DSC-27-20-20-10-00000324.0001001 / 17 MAR 17

(*) Only in case the AOA, of the remaining ADRs, disagrees with the AOA (as computed by the PRIM's).

(1) Protection is totally lost, in case of VS 1g computation failure (loss of weight, or slat/flap position).

(2) Protection is lost, in case of a dual ADR failure (or ADR DISAGREE).

(3) Protection is lost, in case of a triple ADR failure (or ADR DISAGREE).

(4) Bank angle limitation remains effective in ALT 1, which uses roll normal.
However, since ALT 1 is generally an unprotected law, all protection marks on the PFD are in amber for simplicity.

(5) When both elevators have failed, only pitch mechanical backup is available, by using the manual pitch trim (THS). “MAN PITCH TRIM ONLY” is displayed in red on the PFDs.

Note: 1. *In case of dual RA failure, flare law is introduced when the landing gear is extended and both autopilots are disengaged. The specific normal law pitch down effect at 50 ft no longer applies.*
2. *A jerk may be felt, in the case of flight control computers reconfiguration (due to hydraulic failure, computer failure, electrical transient...).*

  A340 : MAX SPEED 305 kt/M 0.80
  MAN PITCH TRIM USE

INDICATIONS ON THE PFD

The PFD enhances the flight crew's awareness of the status of flight controls
Specific symbols, and specific formatting of low speed information on the speed scale in normal law, indicate which protection are available.
When protections are lost, amber crosses (X) appear, instead of the green protection symbols (=).
When automatic pitch trim is no longer available, the PFD indicates this with an amber "USE MAN PITCH TRIM" message below the FMA.

Alternate Law

ABNORMAL CONTROL LAWS - IN DETAIL-ALTERNATE LAW

Ident.: DSC-27-20-20-20-00001949.0004001 / 22 APR 16
Applicable to: ALL

ALTERNATE LAW

PITCH

Alternate law in pitch is almost the same for the pilot, as normal control law.
However, alternate law does not maintain any of the protections, except maneuver protection.
As a result, the pilot must fly the aircraft more attentively to avoid inadvertently exceeding the normal limits.
Alternate law reduces MMO to0.82.

AMBER INDICATION THAT PITCH ATTITUDE LIMITATION IS NO LONGER AVAILABLE (ALTERNATE OR DIRECT LAW)
AMBER INDICATION THAT BANK ANGLE LIMITATION IS NO LONGER AVAILABLE (ALTERNATE OR DIRECT LAW)
STALL WARNING SPEED (VSW)

At low speed, the change in the speed scale is very noticeable. VLS remains, but Vα PROT and Vα MAX disappear, replaced by a single black and red strip, the top of which is stall warning speed. Unlike VLS, which is stable, VSW is g sensitive so as to give additional margin in turns.
As mentioned above, ALTERNATE reverts to FLARE law for landing at 100 ft.

ROLL

Roll control is direct. The roll rate is generally higher than with normal law and, at first, the aircraft appears to be very sensitive.

Bank stability and limits are no longer active, and the flight crew should be careful to remain within normal limits.

ALT 1

Ident.: DSC-27-20-20-20-A-00000329.0002001 / 21 MAR 16
Applicable to: ALL

PITCH CONTROL

GROUND MODE

Identical to normal law ground mode.

FLIGHT MODE

Flight law is a load factor demand law, similar to normal law, with limited pitch rate feedback and gains, depending on the speed and configuration.

FLARE MODE

Flare law is identical to normal flare law.

Ident.: DSC-27-20-20-20-A-00000330.0001001 / 21 MAR 16
Applicable to: ALL

LATERAL CONTROL

Lateral control is similar to normal law, except that alterations of positive spiral static stability will not occur due to the loss of high AOA and high speed protection.

Ident.: DSC-27-20-20-20-A-00000331.0001001 / 21 MAR 16
Applicable to: LV-KHT, LV-KHU

PROTECTIONS

LOW SPEED STABILITY

At low speed, a nose down demand is introduced in reference to IAS, instead of angle of attack, and alternate law changes to direct law.
It is available, whatever the slats/flaps configuration, and it is active from about 5 kt up to about 10 kt above the stall warning speed, depending on the aircraft's weight and slats/flaps configuration.
A gentle progressive nose down signal is introduced, which tends to keep the speed from falling below these values. The pilot can override this demand.
Bank angle compensation is provided.
In addition, aural stall alert (“STALL, STALL” synthetic voice then cricket) is triggered at an appropriate margin from the stall condition.
The PFD speed scale is modified to show a black/red barber pole below the stall warning.
Vα prot and Vα max are replaced by Vsw (stall warning speed).

The α floor protection is inoperative.

HIGH SPEED STABILITY

Above VMO/MMO, a nose up demand is introduced to avoid an excessive increase in speed.
The pilot can override this demand.
The high speed protection symbol (VMO + 4) disappears.
In addition, the overspeed warning (VMO + 4 or MMO + 0.006) remains available.

PITCH ATTITUDE PROTECTION

Lost.

Ident.: DSC-27-20-20-20-A-00000331.0002001 / 09 OCT 14
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

PROTECTIONS

LOW SPEED STABILITY

At low speed, a nose down demand is introduced in reference to IAS, instead of angle of attack, and alternate law changes to direct law.
It is available, whatever the slats/flaps configuration, and it is active from about 5 kt up to about 10 kt above the stall warning speed, depending on the aircraft's weight and slats/flaps configuration.
A gentle progressive nose down signal is introduced, which tends to keep the speed from falling below these values. The pilot can override this demand.
Bank angle compensation is provided.
In addition, stall alerts (“STALL, STALL” synthetic voice then cricket and "STALL STALL" red message on PFD) are triggered at an appropriate margin from the stall condition.
The PFD speed scale is modified to show a black/red barber pole below the stall warning.
Vα prot and Vα max are replaced by Vsw (stall warning speed).
The α floor protection is inoperative.

HIGH SPEED STABILITY

Above VMO/MMO, a nose up demand is introduced to avoid an excessive increase in speed.
The pilot can override this demand.
The high speed protection symbol (VMO + 4) disappears.
In addition, the overspeed warning (VMO + 4 or MMO + 0.006) remains available.

PITCH ATTITUDE PROTECTION

Lost.

ALT 2

Applicable to: ALL

PITCH CONTROL

Identical to ALT 1 law.

Ident.: DSC-27-20-20-20-B-00000344.0001001 / 21 MAR 16

LATERAL CONTROL

ROLL DIRECT LAW

Provides a direct stick-to-surface position relationship. The gains are automatically set according to the slats/flaps configuration.
The maximum roll rate is approximately 20 to 25 °/s, depending on the speed and configuration.
Spoilers 2, 3 and 6 are inhibited, except in case of some additional failures affecting the lateral control.

YAW ALTERNATE LAW

The dutch roll damping function is available, and damper authority is limited to ± 4 ° rudder (CONF 0) and ± 15 ° (other configuration).
Turn coordination is also provided, except in CONF 0.

Ident.: DSC-27-20-20-20-B-00000345.0001001 / 21 MAR 16

PROTECTIONS

Identical to protections in ALT 1, except that :

1. There is no bank angle protection in ALT 2 law.
2. In case of failure of 2 ADRs, there is no low speed stability.
3. In case of failure of 3 ADRs, there is no high speed stability.

Direct Law

GENERAL

Ident.: DSC-27-20-20-30-00000353.0001001 / 21 MAR 16
Applicable to: ALL

Pitch direct law is a direct stick to elevator relationship (elevator deflection is proportional to stick deflection).
In all configurations, the maximum elevator deflection varies as a function of the CG.
It is a compromise between the adequate controllability at forward CG, and the not-so-sensitive controllability at aft CG.
As there is no automatic trim, the pilot has to use manual trim.
The "USE MAN PITCH TRIM" amber message is displayed on the PFD.
All protections are inoperative.
The α floor function is inoperative.
As per alternate law, overspeed and stall warnings are available.

Abnormal Attitude Laws

GENERAL

Ident.: DSC-27-20-20-40-00000360.0007001 / 03 MAY 23
Applicable to: ALL

If for any reason the aircraft goes far outside the normal flight envelope and reaches an extreme attitude, the flight control law will be modified.
The abnormal attitude law will engage and will provide the PF with maximum efficiency to recover normal attitude.

The abnormal attitude law engages when one of the following values is reached:
- If at least 2 ADCs are valid and consistent: Pitch attitude above 50 ° nose up or below 30 ° nose down.
  If not: Pitch attitude above 40 ° nose up or below 20 ° nose down
- Bank angle is above 125 °
- Angle of attack is above 40 °
- Speed is above 440 kt or below 60 kt
- Mach is above 0.96 or below 0.1.

When the abnormal attitude law engages:
- The pitch alternate law is active
- The roll direct law is active
- The yaw mechanical law is active
- Autotrim is not available. Therefore, USE MAN PITCH TRIM is displayed on the PFDs, and
- F/CTL ALTN LAW is displayed on the ECAM.

When the aircraft returns within the normal flight envelope, the abnormal attitude law disengages and the following conditions remains for the remainder of the flight:
- The pitch alternate law is active with autotrim
- The roll direct law is active
- The yaw alternate law is active
- F/CTL ALTN LAW is displayed on the ECAM.

Intentionally left blank

Mechanical Back Up

GENERAL

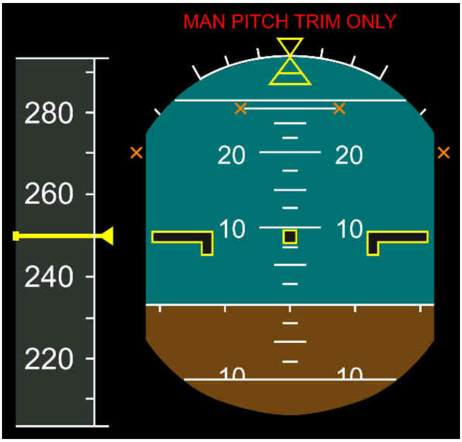
Ident.: DSC-27-20-20-50-00000361.0001001 / 17 MAR 17
Applicable to: ALL

The purpose of the backup is to achieve all safety objectives in MMEL dispatch condition: To manage a temporary and total electrical loss, the temporary loss of five fly-by-wire computers, the loss of both elevators, or the total loss of ailerons and spoilers.
It must be noted that it is very unlikely that the backup will be used, due to the fly-by-wire architecture. For example, in case of electrical emergency configuration, or an all-engine flameout, alternate law remains available.

PITCH

Ident.: DSC-27-20-20-50-00000362.0001001 / 17 MAR 17
Applicable to: ALL

Pitch mechanical control is achieved through the THS, using manual trim control.
«MAN PITCH TRIM ONLY» is displayed in red on the PFDs.



LATERAL

Ident.: DSC-27-20-20-50-00000363.0002001 / 21 MAR 16

Applicable to: ALL

The Backup Control Module (BCM) computer provides yaw damping and direct rudder command with pedals. This computer includes its own electrical generator, supplied by the B or Y hydraulic system.

(1) RUD TRIM selector
Controls the rudder trim actuator, which moves the neutral point of the artificial feel by an equivalent of :

In clean configuration	:	1 °/s of rudder travel
Slats/flaps extended	:	1 °/s of rudder travel for quick inputs 3 °/s for inputs longer than 1.5 s

(2) RESET pb

By pushing the RESET pb, the zero trim position is ordered at 3 °/s.
After the reset, an indication of up to 0.6° (L or R) may be observed in the rudder trim position indication.

Note: The rudder trim rotary switch, and the RESET pb, are not active with autopilot engaged.

(3) RUD TRIM Position Indicator

Displays rudder trim direction (L or R) and value (0 to 25 °).

(4) SPEEDBRAKE lever

Controls:

- The position of the speedbrake surfaces.
  To set speedbrake surfaces to a required position, the speedbrake lever has to be pushed down and set to the required position. A “hardpoint” is provided at “½” SPEEDBRAKE position.
- The manual preselection of the ground spoilers.
  To arm the ground spoilers, the lever must be pulled up when in the RET position.
  When the lever is armed (or reverse thrust is selected), all spoilers' surfaces will automatically extend at landing, or in case of a rejected takeoff.

(5) PITCH TRIM wheel

Both pitch trim wheels provide mechanical control of the THS and have priority over electrical control.

Note: Crew action on the pitch trim wheel does not disconnect the PRIMs (micro-switches, actuated by the override mechanism, ensure that the computers remain synchronized with the manually-selected position).

The THS is manually-controlled on ground for the THS setting, before takeoff, and in flight, when in direct law:

- Before takeoff, the pilot sets the THS to the angular value, determined as a function of the aircraft CG, using the CG scale on the wheel. The relationship between the aircraft CG and the THS setting on the trim wheel is only applicable for takeoff. The limits of the THS normal setting range for takeoff are indicated by a green band on the pitch trim wheel.
- In flight, when in direct law, the pilot uses the THS conventionally to fly in trim. In flight, the aircraft pitch trim setting depends on the aircraft CG, weight, altitude and speed. As the result, the relation between the aircraft CG, and the THS setting displayed on the pitch trim wheel, does not apply in flight.

After nosewheel touchdown, when the pitch attitude becomes less than 2.5 ° for more than 5 s, and the ground spoilers are retracted, pitch trim is automatically reset to 4 ° UP.

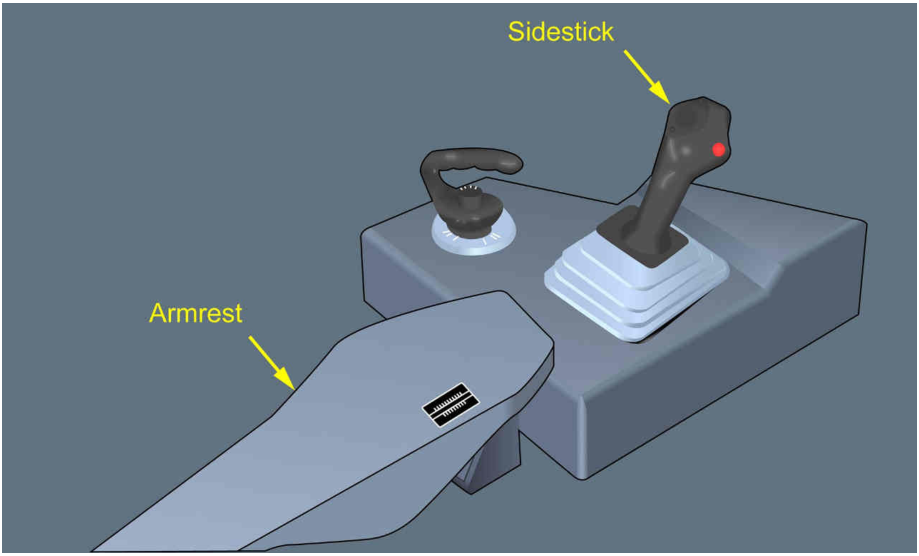
The relationship between the aircraft CG and the THS setting on the trim wheel is only applicable for takeoff. The limits of the THS normal setting range for takeoff are indicated by a green band on the pitch trim wheel.
- In flight, when in direct law, the pilot uses the THS conventionally to fly in trim. In flight, the aircraft pitch trim setting depends on the aircraft CG, weight, altitude and speed. As the result, the relation between the aircraft CG, and the THS setting displayed on the pitch trim wheel, does not apply in flight.

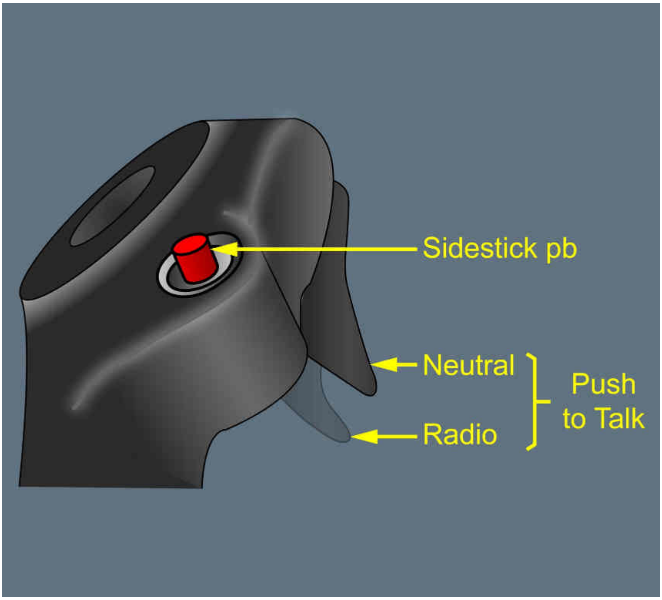
After nosewheel touchdown, when the pitch attitude becomes less than 2.5 ° for more than 5 s and if the ground spoilers are retracted:
- If the speed is below 80 kt, pitch trim automatically resets to 4 ° UP.
- If the speed is above 80 kt, a touch-and-go is detected, and the pitch trim is automatically set to the takeoff value, based on the CG measured during the approach.

LATERAL CONSOLES

Ident.: DSC-27-20-30-00000396.0003001 / 18 MAY 22
Applicable to: ALL



SIDESTICKS



The sidesticks are springloaded to neutral. They are not mechanically linked, and do not receive feedback from the flight control surfaces.
When the autopilot is engaged, the sidesticks are locked in the neutral position.

If a flight crewmember applies a force above a given threshold:
- The sidestick unlock
- The autopilot disengages
- The AUTO FLT AP OFF alert triggers.

L3 The autopilot disengages when a pilot applies a force of more than 5 daN in pitch, or 3.5 daN in roll.

L1 *Note:* *This is not the recommended method for autopilot disengagement. For more information, Refer to DSC-22_30-30-30 Manual Disengagement 1*

Each sidestick has two controls:
- The Radio Push To Talk switch
- The sidestick pb, for autopilot disengagement, or sidestick priority.

SIDESTICK PRIORITY LOGIC

At all times, only one flight crewmember should fly the aircraft.
However, if both flight crewmembers use their sidesticks simultaneously, their orders are algebraically added.

L2 The flight control laws limit the combined order to the equivalent of the full deflection of one sidestick.

L1 In this case the two green SIDE STICK PRIORITY lights on the glareshield come on and "DUAL INPUT" voice message is activated.
A flight crewmember can deactivate the other sidestick and take full control, by pressing and keeping pressed the sidestick pb.
To deactivate the other sidestick, the flight crewmember must press their sidestick pb for 40s.
The other sidestick is permanently deactivated, until any flight crewmember presses their sidestick pb.
If both flight crewmembers press their sidestick pb, the last pilot to press gets the priority.

L2 If one sidestick was deactivated on ground, the CONFIG L(R) SIDESTICK FAULT alert is triggered at takeoff power application, or during the TO CONFIG test.

L1 For more information: *Refer to DSC-27-20-30 Glareshield*

ARMREST

The armrest on the sidestick side of the Captain and F/O seats are adjustable.
Correctly adjusting the seat eases the handling of the sidestick.
For information on how to adjust the armrest: *Refer to DSC-25-10-30 Pilot Seat Outboard Armrest Adjustment*.

GLARESHIELD

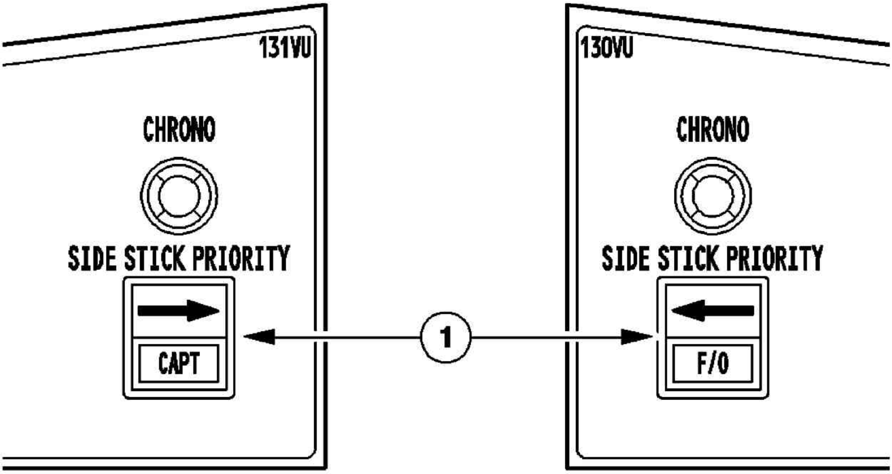
Applicable to: ALL



(1) SIDE STICK PRIORITY lt

Arrow red lt : - Illuminates in front of the flight crew losing authority.
- Extinguishes if flight crew has recovered their authority, ie:
  - If the other take-over pushbutton is released prior priority condition is latched, or
  - If flight crew has used their take-over pushbutton to cancel a latched priority situation.

Sidestick priority audio: a "PRIORITY LEFT" or "PRIORITY RIGHT" audio voice message is given each time priority is taken.

CAPT-F/O green lt :	- Illuminates in front of the flight crew who has taken priority by pressing the takeover push button if the opposite stick is not at neutral. or - CAPT and F/O light illuminate in case of simultaneous input on both sidesticks. - Extinguishes when the opposite stick is returned to the neutral position.

Rudder Travel Limiter or PTLU Indication

	Normal operation.
	Travel Limiters 1 and 2 failed.

Rudder Trim Position

	Normal operation. The position varies from -29.2 ° to +29.2 °.
	The rudder trim systems 1 and 2 are inoperative.

NORM CTL Message

NORM CTL	The normal rudder command is lost. The rudder is then controlled by the Backup Control Module.

MEMO DISPLAY

Ident.: DSC-27-20-30-A-00017253.0001001 / 06 SEP 16
Applicable to: ALL

GND SPLRS ARMED : This memo appears in green, when the ground spoilers are armed.

Ident.: DSC-27-20-30-A-00017255.0010001 / 21 MAR 16
Applicable to: LV-KAN, LV-KAO

SPEED BRK : This memo flashes in amber, when the speedbrakes are extended in Flight Phases 2, 3, 4, and 5.

SPEED BRK : This memo appears in green, when the speedbrakes are extended in Flight Phase 6.

After a delay, this memo flashes in amber if one of the following conditions occurs:
- After 50 s, if at least one engine is above idle, or
- After 7 s, if at least one engine is above idle and the AP/FD TCAS mode orders a TCAS RA nose-up maneuver.

SPEED BRK : This memo appears in green, when the speedbrakes are extended in the final approach below 800 ft. After 5 s, this memo flashes in amber, regardless of the landing configuration.

Ident.: DSC-27-20-30-A-00017255.0003001 / 21 MAR 16
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KHT, LV-KHU

SPEED BRK : This memo flashes in amber, when the speedbrakes are extended in Flight Phases 2, 3, 4, and 5.

SPEED BRK : This memo appears in green, when the speedbrakes are extended in Flight Phase 6. This memo flashes in amber, after 50 s, if at least one engine is above idle.

SPEED BRK : This memo appears in green, when the speedbrakes are extended in Flight Phase 7. After 5 s, this memo flashes in amber, and the associated "SPD BRK STILL OUT" caution appears on the ECAM, regardless of the landing configuration.

Applicable to: ALL

TURB DAMP OFF : This memo appears in green, when the TURB DAMP pb is set to OFF.

GENERAL

Ident.: DSC-27-30-10-00000488.0001001 / 03 NOV 21
Applicable to: ALL

The slat and flap system includes all of the following main components:
- Seven slats, two flaps surfaces and two ailerons (aileron droop function) per wing. These surfaces are electrically controlled and hydraulically operated. The flight crew extends the slats and flaps by moving the flaps lever on the center pedestal. It has five positions.
- Two SFCCs, each containing one slat channel and one flap channel
- A PCU which is made of two independent hydraulic motors coupled by a differential gearbox. The motors use green and blue hydraulic power for the slats, and yellow and green power for the flaps. The POB locks the transmission when the slat or flap surfaces have reached the selected position or if hydraulic power fails.
- Two APPUs that measure the asymmetry between the left and right wings
- A flap disconnect detection system, which detects attachment failure and inhibits the flap operation in order to prevent further damage. A sensor detects the failure by measuring excessive differential movement between the inner and the outer flaps.
- The WTBs which activate in the case of an uncommanded movement of the surfaces, such as runaway, asymmetry or over speed. They cannot be released in flight. They use blue and green hydraulic power for the slats, and green and yellow for the flaps.
- The FPPUs that feedback position information to the SFCCs
- An IPPU that sends position data to the ECAM.

Note:
- *If the flap WTB is on, the flight crew can still operate the slats, and if the slat WTB is on, the flight crew can still operate the flaps*
- *If one SFCC is inoperative, both slats and flaps operate at half speed*
- *If one hydraulic system is inoperative, the corresponding surfaces (slats or flaps) operate at half speed.*

CONFIGURATIONS

Ident.: DSC-27-30-10-00000492.0001001 / 21 MAR 16
Applicable to: ALL

The FLAPS lever has 5 positions: 0, 1, 2, 3 and FULL.
Two configurations correspond to the FLAPS lever position 1 : CONF 1 or CONF 1 + F.
The selection is done as explained in the following paragraphs.

AUTOMATIC RETRACTION SYSTEM (ARS)

Ident.: DSC-27-30-10-00000493.0001001 / 21 MAR 16
Applicable to: ALL

When CONF 1 + F is selected, the auto retraction of flaps to 0 occurs at 200 kt (before VFE, which is 215 kt).

FLAP LOAD RELIEF SYSTEM (FLRS)

Ident.: DSC-27-30-10-00000494.0003001 / 21 MAR 16
Applicable to: ALL

Only available in CONF 2, 3, or FULL. When activated, the system retracts the flaps to the deflection corresponding to the next retracted lever position.
Auto retraction of the flaps only occurs in case of VFE exceedance (VFE +2.5 kt).
If speed is reduced below VFE (VFE -2.5 kt), flaps return to their normal (selected) position.
In CONF 2, auto retraction results in CONF 1* (20 ° slats/8 ° flaps).
In CONF 3, auto retraction results in CONF 2* (23 ° slats/14 ° flaps).
These configurations can be obtained only by FLRS activation.

Note:
1. *When FLAPS 1 is selected, VFE of CONF 1 or CONF 1 + F is displayed, depending on the actual configuration. In approach, VFE next is 205 kt (VFE of CONF 1*).*
2. *When FLAPS 2 is selected in approach, VFE of CONF 2 or CONF 1* is displayed, depending on the FLRS activation.*
3. *When FLAPS 3 is selected, only VFE of CONF 3 is displayed on PFD independently of FLRS activation.*

In case of FLRS activation, the ECAM upper display shows a flashing “RELIEF” message.
If the speed is increased by 4 kt above the VFE, corresponding to the actual flap/slat configuration, an overspeed warning appears on the ECAM.

SLATS ALPHA/SPEED LOCK FUNCTION

Ident.: DSC-27-30-10-00000496.0003001 / 17 MAR 11
Applicable to: ALL

This function inhibits slats retraction at a high angle-of-attack and/or at low speed.
The SFCCs use a corrected angle-of-attack (alpha), or air speed information from the ADIRUs to inhibit slat retraction.
If alpha exceeds 8.5 °, or the speed goes below 148 kt, the retraction from position 1 to 0 is inhibited.
The inhibition is removed when alpha goes below 8.2 °, and when the speed exceeds 154 kt. In this case, the slats automatically retract to 0.

The function is not active if:
- Alpha exceeds 8.5 °, or the speed goes below 148 kt after the lever has been set to 0.
- Aircraft is on the ground, with the speed below 60 kt.

SIGNALS TO OTHER SYSTEMS

Ident.: DSC-27-30-10-00000497.0001001 / 21 MAR 16
Applicable to: ALL

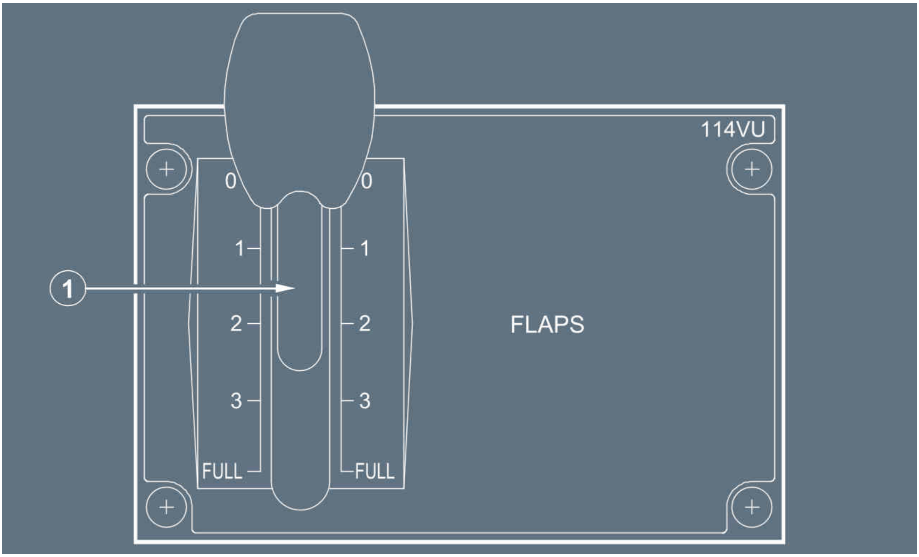
The SFCCs transmit flaps/slats positions to the following systems :
- PRIM and SEC
- FMGEC
- ADIRU
- EIU
- CIDS
- GPWS

Note: *The ECAM system receives the position information directly from the Instrumentation Position Pick-Off Unit (IPPU). This information is used for warnings and position indications on the E/WD.*

Intentionally left blank

PEDESTAL

Ident.: DSC-27-30-20-00000498.0003001 / 09 OCT 12
Applicable to: ALL



(1) FLAPS lever
The FLAPS lever selects simultaneous operation of the slats and flaps.
The five lever positions correspond to the following surface positions :

Lever Position	SLATS	FLAPS	AILERONS	Indication on ECAM	Flight phase		
0	0	0	0				CRUISE
1	16	0	0	1			HOLD
		8	5	1 + F	TO		
2	20	8	10	2(1)			APPR
	20	14	10	2	TO		
3	23	14	10	3(2)		LDG	
3	23	22	10	3			
FULL	23	32	10	FULL			

(1) *This slats/flaps position corresponds to CONF 1**

(2) *This slats/flaps position corresponds to CONF 2**

Before selecting any position, the lever must be pulled out of detent.

Moreover, balks are provided at Positions 1 and 3 to avoid excessive flap/slat travel demand by a single pilot action.

Note: *It is not possible to select an intermediate lever position.*

TAKEOFF IN CONF 1 :

CONF 1 + F (16/ 8) is selected. The flaps automatically retract at 200 kt.

TAKEOFF OR GO-AROUND IN CONF 2 OR 3 :

At FLAPS 1 selection : CONF 1 + F (16 / 8) is selected, if speed it less than 200 kt.
Then, the flaps automatically retract at 200 kt.

0 TO 1 ABOVE 100 KNOTS :

CONF 1 (16/ 0) is selected.

Note: *After flaps retraction, CONF 1 + F is no longer available until the speed is 100 kt or less, except if CONF 2 or more has been previously selected.*

INDEXES
①

(1) Position indexes:
A fixed grey center part, and three plus four white dots, show all the flaps and slats positions.
The white dots are not displayed in clean configuration.

(2) F and S
Normally white. Not displayed in clean configuration.

The F symbol is :
- replaced by the amber “F LOCKED” message, when wing tip brake is applied to flaps.
- replaced by the green pulsing “F RELIEF” message when the flap load relief system is activated.
- displayed in amber at flap system failure or at yellow and green hydraulic system low pressure.

The S symbol is :
- replaced by the amber “S LOCKED” message when wing tip brake is applied to slats.
- replaced by the green pulsing “A LOCK” message when the alpha/speed lock function is activated.
- displayed in amber at slat system failure or at blue and green hydraulic system low pressure.

(3) Flaps/Slats actual position

The green boxes move independently, when flaps/slats are retracted or extended. When fully retracted, boxes are side by side with wing fixed part. The signal is acquired by separate sensors, not used by the SFCC.
Symbols become amber when S (F) LOCKED. The slat box pulses in green, when the alpha/speed lock function is active. The flap box pulses in green, when the flap load relief system is active.

(4) Selected position

It is in blue when the surfaces are in transit.
It disappears, when the selected position has been reached.
It is provided by the SFCC.

(5) Lever position

Numbers and letters indicate the flap/slat position. It is in green when the actual position agrees with the selected position. It is in blue, when the surfaces are in transit. It is not displayed in clean configuration. It is provided by the SFCC.

DESCRIPTION

Ident.: DSC-28-10-10-00000136.0006001 / 10 DEC 09
Applicable to: LV-KAN, LV-KAO

The fuel system :
- Stores fuel.
- Controls and monitors the correct quantity of fuel.
- Supplies fuel to the engines and the Auxiliary Power Unit (APU).
- Controls the transfer of fuel to maintain the Center of Gravity (CG) within limits.
- Maintains fuel in the outer tanks for wing bending relief.
- Allows fuel jettison for rapid weight reduction.
- Controls refueling and defueling.

DESCRIPTION

Intentionally left blank

GENERAL

Ident.: DSC-28-10-20-00000143.0001001 / 10 DEC 09
Applicable to: ALL

Fuel is stored in the :
- Wings
- Center section
- Trimmable Horizontal Stabilizer (THS).

DESCRIPTION

Ident.: DSC-28-10-20-00000146.0005001 / 18 MAR 11
Applicable to: ALL

The wings have inner and outer tanks. Each inner tank contains one collector cell that:
- Maintains a fuel reservoir for the fuel booster pumps and provides negative 'g' protection to feed the engines.
- Is maintained full and contains about 1 000 kg (2 200 lb) of fuel.

Each inner tank is divided into two parts via a SPLIT valve that normally remains open. The inner tank is used as a single tank and, if tank damage is suspected (i.e. FQI data is lost or there is a rapid FQI decrease following an engine failure), the SPLIT valve can be manually closed by using the dedicated pushbutton on the overhead panel.
When split valves are closed, the fuel contained in the AFT section of INNER tanks is still usable via the standby pumps.
In each wing, and on the right of the THS trim tank, there is a vent surge tank outboard of the outer tank.
After refueling to maximum tank capacity, fuel can expand by 2 % (20 °C temperature increase) without spillage.
There is an overpressure protector in each wing surge tank, in the trim surge tank, and between the center and the right inner tanks.

GENERAL

Ident.: DSC-28-10-30-00000161.0003001 / 18 MAR 11
Applicable to: ALL

The fuel system is controlled by two Fuel Control and Monitoring Computers (FCMC).

The FCMCs :
- Measure the fuel quantity and indicate it on the ECAM.
- Calculate the aircraft's Gross Weight and Center of gravity, based on the Zero Fuel Weight and the CG entered by the crew.
- Control transfer of fuel to the inner tanks for engine feed.
- Control transfers of fuel to and from the trim tank for CG control.

Magnetic level indicators are fitted in the lower surfaces of the wing tanks to allow the manual measurement of each tank's fuel quantity.

Intentionally left blank

FUEL QUANTITY INDICATION

Ident.: DSC-28-10-40-00000165.0001001 / 10 DEC 09
Applicable to: ALL

One FCMC is active and the other is on standby. If the first FCMC fails, then the other FCMC takes over.

Each FCMC calculates the fuel quantity by using the :
- Fuel volume from the fuel probes.
- Fuel density from the densitometers.
- Horizontal Stabilizer angle.
- Aircraft attitude.
- Fuel electrical characteristic from the compensators

The calculated fuel quantity is indicated on both the ECAM and the refuel control panel.

FUEL LEVEL SENSING

Ident.: DSC-28-10-40-00000166.0004001 / 14 FEB 11
Applicable to: ALL

The FCMC also uses information from the following fuel level sensors to control transfers and to provide warnings, independently of the fuel quantity indication:
- Low level sensors:
  - To trigger low level warnings and stop jettison ◁
  - To control center and trim tank transfers.
- High level sensors: To stop refueling when a tank is full
- Vent surge tank level sensor: To stop refueling, or fuel transfer, in case of tank overflow.

GENERAL

Ident.: DSC-28-10-50-00000168.0003001 / 10 DEC 09
Applicable to: ALL

The main fuel pump system supplies fuel from each inner tank to its corresponding engine. In each wing there are three fuel pumps. Two main fuel pumps in the collector cell and one standby pump outside the collector cell. When closed, the crossfeed valves separate the system into two parts, and their associated fuel pumps supply the engines. When open, the crossfeed valves allow any pump to supply any engine.

MAIN COMPONENTS

Applicable to: ALL

Ident.: DSC-28-10-50-A-00000170.0002001 / 10 DEC 09

INNER TANK PUMPS

During normal operation, all main pumps run.
If a main pump fails, or is switched off, then the standby pump runs. With the crossfeed valves open, one pump is capable of supplying all both engines.

Ident.: DSC-28-10-50-A-00000176.0003001 / 10 DEC 09

CROSSFEED VALVES

The cross feed valve enables any pump to supply any engine. The X-FEED valves automatically opens in electrical emergency configuration.

Ident.: DSC-28-10-50-A-00000181.0001001 / 10 MAY 21

ENGINE LP VALVE

The flow of fuel to an engine can be stopped by closing its respective LP valve via:
- Engine master lever, or
- ENG FIRE pushbutton.

FUEL FEED WITH ALL ENGINES FLAME OUT (ELEC EMER CONFIG)

Applicable to: ALL

Ident.: DSC-28-10-50-B-00000190.0003001 / 21 MAR 17

EMER GEN POWERED BY THE RAT

- The X-FEED valve open automatically.
- Only the left Pump 2 remains powered.

- If left Pump 2 fails, or is selected OFF, right Pump 2 will automatically replace it.
- When the speed goes below 260 kt, or when LAND RECOVERY is selected ON, all MAIN and STBY pumps are lost.

Ident.: DSC-28-10-50-B-00000195.0002001 / 14 FEB 11

FLIGHT ON BATTERIES

All main and STBY pumps are lost.

NORMAL OPERATION

Ident.: DSC-28-10-60-00000219.0008001 / 14 FEB 11
Applicable to: ALL

Fuel is always fed to the engines from the inner tanks.

The fuel transfer sequence is as follows:
1. Center tank fuel transfers to the inner tanks.
2. Each inner tank empties down to 4 000 kg (8 830 lb).
3. Trim tank fuel transfers to the inner tanks.
4. Each inner tank empties down to 3 500 kg (7 720 lb).
5. Outer tank fuel transfers to the inner tanks.

Note: *If required for CG control, the trim tank may be emptied earlier (Refer to DSC-28-10-90 General).*

Intentionally left blank

CENTER TO INNER TANK TRANSFER

Ident.: DSC-28-10-70-00000221.0001001 / 14 FEB 11
Applicable to: ALL

The center tank pumps run continuously, whenever there is fuel in the center tank. Each inner tank inlet valve controls the transfer by cycling its inner tank contents between full and approximately 2 000 kg (4 415 lb) below full. When the center tank is empty, both center tank pumps temporarily stop, and both inner tank inlet valves close.

OUTER TO INNER TANK TRANSFER

Ident.: DSC-28-10-70-00000230.0002001 / 14 FEB 11
Applicable to: ALL

The outer tank fuel is transferred to the inner tanks by gravity. Each outer tank transfer valve controls the transfer by cycling the associated inner tanks contents between 3 500 kg (7 720 lb) and 4 000 kg (8 830 lb). When each outer tank has been empty for 5 min, its outer tank transfer valves close.

TRIM TANK TRANSFER

Ident.: DSC-28-10-70-00000240.0001001 / 10 DEC 09
Applicable to: ALL

Refer to DSC-28-10-90 General.

TRANSFER FROM OUTER TANKS

CENTER TO INNER TANK TRANSFER

Ident.: DSC-28-10-80-00000244.0001001 / 14 FEB 11
Applicable to: ALL

Transfer from the center to inner tanks can be manually selected with the CTR TK XFR pb. When selected MAN, the inner tank inlet valves are opened and the CTR TK pumps run.

The CTR TK pumps must be selected OFF, when the:
- Inner tanks are full, to manually prevent inner tank overflow.
- Center tank is empty.

Note: 1. *When the fuel quantity of each inner tank is below 17 000 kg (37 520 lb), all center tank fuel can be transferred without any risk of overflow.*
2. *When the CTR TK XFR pb is pressed, aft transfer is inhibited.*

OUTER TO INNER TANK TRANSFER

Ident.: DSC-28-10-80-00000247.0001001 / 14 FEB 11
Applicable to: ALL

Transfer from the outer to inner tanks can be manually selected with the OUTR TK XFR pb. When selected ON, the outer tank fuel transfer valves, and the inner and outer inlet valves are opened.

Note: 1. *During an outer to inner tank transfer, the CTR TK pumps must be selected OFF to avoid inadvertent fuel transfer from the center tank to outer tanks.*
2. *When the OUTR TK XFR pb is pressed, aft transfer is inhibited.*

Intentionally left blank

GENERAL

Ident.: DSC-28-10-90-00000263.0001001 / 10 DEC 09
Applicable to: ALL

The trim tank transfer system controls the aircraft's Center of Gravity (CG).

- The system either transfers fuel to the trim tank (aft transfer) or from the trim tank (forward transfer).
- This movement of fuel changes the aircraft's CG.
- When the aircraft is in cruise, the system optimizes the CG position to increase fuel economy by reducing drag.
- Normal operation is automatic, but the crew can manually select a forward fuel transfer.
- The Fuel Control and Monitoring Computer (FCMC) calculates the aircraft's CG and compares it to a target value. (This target depends on the aircraft's actual weight. *Refer to DSC-28-10-90 AFT CG Target*).
- Based on this calculation, the FCMC determines the quantity of fuel to be moved aft or forward in flight.

Automatic CG control:
- Begins during climb to FL 255.
- Ends at descent to FL 245, or when the FMGES time to destination is less than 35 min (or less than 75 min in the case of trim tank forward transfer pump failure).

Note: 1. *The trim pipe isolation valve and the trim tank isolation valve are closed during takeoff and landing. It is possible to reopen them, when the landing gear is up and the slats are retracted (or when the MODE SEL sw is set at REFUEL on the REFUEL panel).*
2. *If the FMGEC detects a CG that is too far aft, then the target will automatically be moved forward by 3 %. The target also moves forward 1.5 % in the case of FQI data degradation, or if ZFW/ZFWCG have not been entered or need to be reinitialized in flight (modifying CG/GW via the MCDU).*
3. *The above-mentioned CG target alterations should be added together.*

AFT FUEL TRANSFER

Applicable to: ALL

Ident.: DSC-28-10-90-A-00000305.0005001 / 21 MAR 17

GENERAL

In flight, the FCMC only starts an AFT fuel transfer, when all of the following conditions are met:
- Landing gear is retracted.
- Slats are retracted.
- Trim tank is not full.
- Inner tank's fuel quantity is above 6 250 kg (13 790 lb).
- Aircraft is above FL 255.
- Aircraft CG is not on target.

Normally, only one aft fuel transfer occurs per flight. However, if the CG in cruise is ahead of the target by more than 2 % , and the trim tank quantity is below 3 000 kg (6 620 lb), an additional aft transfer will occur. An aft transfer stops when the :
- Computed CG = Target CG -0.5 % , or
- Trim tank high level sensor becomes wet, or
- Inner tank's fuel quantity reaches 6 250 kg (13 790 lb), or
- T TANK MODE pushbutton is set to FWD, or
- Fuel transfer from the center or outer tanks to the inner tanks is manually selected.
- Fuel automatically transfers from the center tank to the inner tanks.

Fuel for trim tank aft transfer is provided by the center TK, when it contains fuel, or by the inner tanks when the center tank is empty. If, during the transfer, the inner tanks are unbalanced by more than 500 kg (1 100 lb), the transfer will stop on the lightest side, and the related aft transfer valve will automatically close until fuel balance is restored.

AUTOMATIC FORWARD FUEL TRANSFER

Applicable to: ALL

Ident.: DSC-28-10-90-B-00000327.0009001 / 28 MAR 11

GENERAL

The FCMC sends a forward fuel transfer signal, if one of the following conditions are met:
- The calculated CG = Target. Forward fuel transfer stops, when the computed CG = The target CG -0.5 %.
- The fuel contents of one of the two inner tanks decreases to 4 000 kg (8 830 lb). Forward fuel transfer stops, when the fuel content reaches 5 000 kg (11 030 lb)

- The FMGES sends a time-to-destination signal below the threshold, or the aircraft descends below FL 245. In this case, transfer is continuous but is controlled by the inner tank high levels to prevent overflow.
- Jettison ◁ is initiated.
- In electrical emergency configuration.

Note: *If the center tank contains fuel and the CG is forward of 32 % MAC, the transfer will be completed in two steps:*
  - *When the center tank quantity reaches 17 000 kg (37 520 lb), the trim tank is decreased to 2 400 kg (5 290 lb).*
  - *When the center tank is empty, the trim tank will be emptied.*

A forward transfer:
- Is normally directed to the inner tanks, and may be directed to the center tank, if it is not empty.
- Is directed to the lighter inner tank, if there is an imbalance of 500 kg (1 100 lb) between the two inner tanks.

In emergency electrical configuration, the forward transfer is always directed to the inner tanks.
In normal operations, a forward transfer is performed by the trim tank forward transfer pump. The pump starts to operate, when both the landing gear and the slats are retracted, as long as there is fuel in the trim tank. It operates continuously during the flight, until the trim tank is empty, or the T. TANK FEED selector is set to ISOL.

Note: *The running trim tank forward transfer pump has no effect on the aft transfer, because the TRIM TK ISOL VALVE is normally closed during this transfer.*

In the event of pump failure, forward transfer occurs by gravity, through the trim tank non-return valve. The FCMC:
- Inhibits the forward transfer by closing the TRIM PIPE ISOL VALVE, when the aircraft pitch exceeds 3.4 ° for more than one minute.
- Restarts the forward transfer, when the aircraft attitude is lower than 3.4 ° for more than 1 min.

Ident.: DSC-28-10-90-B-00000339.0001001 / 14 FEB 11

CENTER TANK EMPTY

- Fuel is transferred from the trim tank to the inner tanks.
- If an inner tank reaches the high level, the related inlet valve closes to prevent tank overflow.
- It reopens when the inner tank quantity reaches 2 000 kg (4 415 lb) below high level.

Ident.: DSC-28-10-90-B-00000347.0001001 / 14 FEB 11

CENTER TANK NOT EMPTY

Fuel is transferred from the trim tank to the center tank.

FWD APU PUMP FEED

Ident.: DSC-28-10-100-00000359.0003001 / 14 FEB 11
Applicable to: ALL

The APU is fed from the Engine 1 collector cells (in the left inner tank) through the APU FWD pump and the APU ISOL valve when :
- On the ground after 2 min (except during trim tank refueling), or
- In flight below FL 255, or
- In flight above FL 255, when the trim tank is empty.

In this case, the AFT APU pump is not running.

AFT APU PUMP FEED

Ident.: DSC-28-10-100-00000765.0002001 / 14 FEB 11
Applicable to: ALL

The APU is fed from the trim pipe :
- The first two minutes when on the ground, or
- During trim tank refueling or,
- During an aft transfer.

The APU is fed from the trim tank :
- In flight above FL 255, as long as the trim tank is not empty, or
- During a forward transfer.

In the above cases, the :
- AFT APU pump is running.
- FWD APU pump is not running.
- APU ISOL valve is closed.

Note: *The AFT APU pump will automatically start, in the event of FWD APU pump failure.*

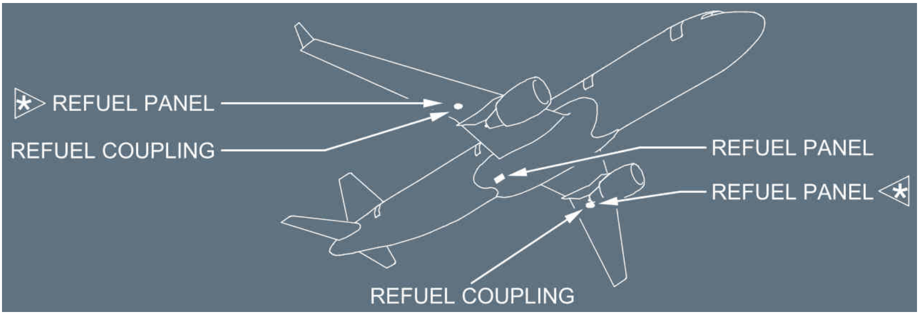
REFUELING-DEFUELING

Ident.: DSC-28-10-110-00000776.0005001 / 20 MAR 17
Applicable to: ALL

During automatic refueling, the trim tank is filled when the preselected fuel quantity is greater than 36 500 kg, whatever the density.
Two refuel couplings are installed under the wings. These couplings allow refueling from both the right and left sides of the aircraft.
A refuel panel is located on the fuselage side, beneath the right wing.
A second and/or third panel ◁✳ is installed close to the refuel couplings.
A gallery connects the refueling coupling to the fuel inlet valve of each tank.



From the cockpit, refueling can be controlled with the refuel pushbutton ◁✳ . Although manual control is possible, it is normally automatic when the required fuel load is set on the preselector. In addition, it is possible to refuel by battery power only.
Any tanks that require refueling, start to be refueled simultaneously. Refuel valves automatically close, either when the required quantity is reached, or when high level is detected.
Wing tank gravity refueling is achieved via overwing refueling points. If the FCMC is powered, transfer is possible from any tank (with inner or center pumps) to outer, inner or center tanks. When both side couplings are used, the refueling time at nominal pressure (50 PSI) is approximately 33 min for all tanks.

Applicable to: LV-KAN, LV-KAO

The Jettison system:
- Makes it possible to jettison fuel in flight.
- Output rate is approximate 1 000 kg (2 200 lb) per minute, excluding fuel burn.
- Is manually activated by two JETTISON pushbuttons, located on the overhead panel. Both pushbuttons must be pressed to select the jettison.

Fuel is simultaneously jettisoned from the inner and the center tanks.

When the crew starts the jettison operation:
- The crossfeed valve opens.
- All main and standby pumps run.

An automatic forward transfer into the center tank is initiated, even if the slats are out, the landing gear is down, and whatever the altitude.
An automatic fuel transfer from the outer tank to the inner tank is also initiated to enable the fuel in the outer tank to be jettisoned.

Note: *In case of the trim tank pump failure, forward transfer is by gravity, as long as the pitch attitude is below 3 °.*

The jettison operation continues, until one of the following occurs:
- The crew stops the operation.
- Both inner fuel tank low level sensor on one side become dry.
- The Fuel Control and Monitoring System (FCMS) stops the operation at a fuel content level preset on the FMGES MCDU.
- The combined inner tank fuel quantity is less than 10 000 kg (22 000 lb).

Note: *The standby pumps continue to run, as long as both JETTISON pushbuttons are selected ON.*

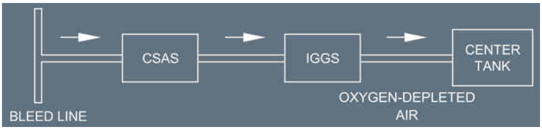
FUEL TANK INERTING SYSTEM

Ident.: DSC-28-10-140-00013685.0003001 / 21 AUG 15
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF

The A330 and A340 aircraft are equipped with a Fuel Inerting System.
The aim of this system is to reduce the flammability in the fuel tanks than have a high flammability exposure.
The fuel center tank is the only one that has a high flammability exposure. Therefore, the Fuel Inerting System only needs to be installed for the center tank. All other tanks do not need Fuel Inerting System installation.
To reduce the flammability in the center tank, the Fuel Inerting System produces an oxygen-depleted air that goes in the center tank to replace the ambient air.

The system is installed in the belly fairing of the aircraft, and is composed by:
- A conditioned Service Air System (CSAS)
- An Inert Gas Generation System (IGGS).

The CSAS extracts and conditions some engine bleed air to adequate pressure and temperature. Then, the air goes through the IGGS where an Air Separation Module taps the nitrogen molecules. Therefore, an oxygen-depleted air is produced (with less than 12 % of oxygen) and replaces the ambient air of the center tank.



The Fuel Inerting System does not require any flight crew action. It works independently as soon as the engines started and until they stop.

Intentionally left blank

On	:	Pump is on.
OFF	:	Pump is off.
FAULT light	:	The amber light and the ECAM caution come on, when the delivered pressure drops. It is inhibited when OFF is selected.

Ident.: DSC-28-20-H-00020051.0001001 / 17 MAR 17

L(R) STBY pb-sw

On : Standby pump runs when associated main pump is failed or off.

OFF : Pump is off.

FAULT light : The amber light and the ECAM caution come on, when the delivered pressure drops. It is inhibited when OFF is selected, or the main pump is running.

Ident.: DSC-28-20-H-00020061.0001001 / 17 MAR 17

L(R) CTR TK pb-sw

On : The center tank pump runs permanently. Appropriate valves control the transfer. The pump stops automatically, when the tank is empty.

OFF : The pump is off.

FAULT light : The amber light and the ECAM caution come on, when:
- The delivery pressure drops, or
- The trim pipe ISOL valve is failed open, or
- A manual transfer from the center tank is required (failure of automatic transfer) and both inner tank quantities are above 17 000 kg (37 520 lb), or
- One outer or inner inlet valve is failed open and both inner tank quantities are above 17 000 kg (37 520 lb).

It is inhibited when OFF position is selected.

Ident.: DSC-28-20-H-00020052.0001001 / 17 MAR 17

T TANK MODE pb-sw

AUTO : The FCMC controls the CG.

FWD : Initiates a manual forward transfer to the center tank, by opening:
- The trim tank ISOL valve,
- The auxiliary forward transfer valve.

And by closing:
- The trim pipe ISOL valve,
- The aft transfer valves.
  And, by operating the trim tank forward transfer pump ◁✻ .

Center tank overflow must be manually prevented.

FAULT light : The amber light and the ECAM caution come on when:
- The FMGS detects an excess aft CG, based on the THS position (independent of fuel quantity), or
- The FCMC is unable to carry out the forward transfer, or
- The FUEL LO TEMP warning is triggered.

Ident.: DSC-28-20-H-00020053.0001001 / 21 MAR 17

T TANK FEED selector

AUTO	:	Stops the forward transfer when the trim tank is at low level, to maintain the transfer line full.
ISOL	:	The transfer line is isolated as the following valves close: - Trim tank ISOL valve, - Trim tank inlet valve, - Auxiliary forward transfer valve, - Trim pipe isolation valve. The trim tank forward transfer pump stops.
OPEN	:	The valves used during a manual forward transfer, and the trim tank inlet valve open. The valves remain open, until 3 min after the trim tank is low, to allow drainage of the transfer pipe.

Note: APU supply is not possible, when the pipe is drained.

Ident.: DSC-28-20-H-00020054.0001001 / 09 MAR 18

OUTR TK XFR pb-sw (GUARDED)

ON	:	Initiates the outer to inner tank transfer by opening: - The outer transfer valves, - The outer inlet valves, - The inner inlet valves.
AUTO	:	The FCMC controls the outer to inner tank transfer.
FAULT light	:	The amber light, and the ECAM caution come on, when: - The inner tank low level is reached and the outer tanks are not empty, or - The FCMC is unable to carry out the transfer to the inner tanks, or - The FUEL LO TEMP warning is triggered.

Ident.: DSC-28-20-H-00020057.0003001 / 17 MAR 17

X FEED pb-sw

ON	:	The valve opens.
AUTO	:	The valve automatically opens in electrical emergency configuration.
OPEN light	:	The green light comes on when the valve is fully open.

Ident.: DSC-28-20-H-00020060.0005001 / 17 MAR 17

CTR TANK XFR pb-sw

AUTO	:	The FCMC controls the center to inner tank transfer.

MAN : Initiates the center to inner tank transfer by opening the inner tank inlet valves.
To avoid inner tank overflow, the center tank pumps may be selected off.

FAULT light : The amber light and the ECAM caution come on when:
- The inner tank low level is reached and the center tank is not empty, or
- The FCMC is unable to carry out the transfer to the inner tanks.

FUEL QUANTITY INDICATOR

Displays, in kg (or lbs) × 1000 :

- The fuel quantity of each tank.
- The pre-selected total quantity. At electrical power up (or FCMC reset), the display shows the ACTUAL value minus 500 kg (1 100 lb). Otherwise, the last pre-selected value is displayed.
- The actual total fuel on board.

- The applicable units (kg or lbs).
- The CKPT light : Comes on when a BLOCK FUEL value has been entered and confirmed on the cockpit MCDU.
- The END light, which flashes when :
  - There is an imbalance greater than 3 000 kg (6 620 lb), after refueling.
  - A failure is detected during a high level test.
  - Refueling is aborted.

  Once refueling is finished, the END light stays on.

Ident.: DSC-28-20-D-00020081.0001001 / 21 MAR 17

HI LVL light

Comes on blue, when high level is detected (i.e. both high level sensors are wet).
The corresponding refuel valve automatically closes.

Ident.: DSC-28-20-D-00020082.0001001 / 21 MAR 17

OVERFLOW light

Comes on amber, when the associated vent tank overflow sensor is covered with fuel.

Ident.: DSC-28-20-D-00020083.0001001 / 17 MAR 17

INCREASE/DECREASE preselector sw

Pressing either side of the switch increases or decreases the preselected quantity.

Ident.: DSC-28-20-D-00020084.0001001 / 21 MAR 17

TRANSF VALVE sw (GUARDED IN CLOSED)

CLOSED : Transfer valves are closed.
OPEN : If the inner tank pumps are on for ground transfer, the aft transfer valves open. The trim tank inlet valve closes.

Ident.: DSC-28-20-D-00020085.0001001 / 21 MAR 17

APU EMERG pb (GUARDED)

When pressed, it initiates the APU shutdown sequence.

Ident.: DSC-28-20-D-00020086.0001001 / 21 MAR 17

POWER SUPPLY sw (GUARDED IN NORM)

NORM : Refueling / Defueling can be supplied either by external power or with the APU generator on line.
BAT : Refueling / Defueling is battery-powered.

Ident.: DSC-28-20-D-00020087.0001001 / 21 MAR 17

HIGH LEVEL TEST sw (GUARDED)

During the test :
- Refueling stops.
- HI LEVEL and OVERFLOW lights come on, if their circuits are serviceable.
- CKPT and END lights come on.
- The PRESELECTED and ACTUAL fuel quantity display all 8 s.

If a failure occurs during the high level test :
- The END light flashes and remains flashing after completion.
- The affected HI LVL light remains on.

Ident.: DSC-28-20-D-00020088.0001001 / 21 MAR 17

REFUEL/DEFUEL VALVES selector (GUARDED IN NORM)

NORM : Refuel / Defuel valves are automatically controlled.

OPEN : Valves open when the MODE SELECT switch is set to the REFUEL or DEFUEL position. In the REFUEL position, each refuel/defuel valve closes when high level is detected in the associated tank.

SHUT : Valves close.

Ident.: DSC-28-20-D-00020098.0001001 / 21 MAR 17

MODE SELECT sw (GUARDED AT OFF)

OFF : Refueling system is off.
Refuel valves close.
APU emergency shutdown and high level test remain available.

REFUEL : Refuel valves operate in automatic or manual mode, depending on the REFUEL / DEFUEL VALVES switch position.

DEFUEL : Refuel valves are open.

FUEL USED (FU) INDICATION (PER ENGINE)

- It is normally green.
- If the fuel flow detection system fails, the FADEC computes a synthetic FU value.

- When this computed value is considered erroneous by more than 136 kg (300 lb), the displayed value is crossed out with two amber bars.
- Units may either be in KG or LB, depending on the DMC pin program.

Ident.: DSC-28-20-F-00020107.0001001 / 17 MAR 17

TOTAL FUEL USED (FU) INDICATION

- It is normally green.
- When either “engine fuel used” is crossed, two amber bars appear across the value.
- Units may either be in KG or LB, depending on the DMC pin program.

Ident.: DSC-28-20-F-00020108.0001001 / 17 MAR 17

FUEL QUANTITY INDICATION

- It is normally green.
- When the fuel quantity indication is not accurate, two amber bars appear across the last two digits.
- If the fuel is unusable (trim or outer tanks only), the quantity indication is displayed in an amber box.
- A partial amber box appears, if 15 t of the center tank fuel is unusable.
- The fuel quantity indication of the inner tanks becomes amber, in case of low level or overflow.
- In the case of imbalance of more than 3 000 kg (6 622 lb) between the left wing tank and right wing tanks, the fuel quantity pulses in the inner and outer tanks.
- Units may either be in KG or LB, depending on the DMC pin program.

Ident.: DSC-28-20-F-00020109.0001001 / 17 MAR 17

COLLECTOR CELL FUEL QUANTITY INDICATION

- It is normally green.
- When the fuel quantity indication is not accurate, two amber bars appear across the last two digits.
- Units may either be in KG or LB, depending on the DMC pin program.

Ident.: DSC-28-20-F-00020110.0001001 / 17 MAR 17

FUEL ON BOARD (FOB) QUANTITY INDICATION

- It is normally green.
- In case of degraded accuracy, the last two digits are dashed.
- Units may either be in KG or LB, depending on the DMC pin program.

Note: *In case any tank’s fuel is partially not usable, the quantity indication is displayed in a partial amber box.*

Ident.: DSC-28-20-F-00020111.0001001 / 17 MAR 17

GROSS WEIGHT INDICATION

- It is normally green.
- When the fuel quantity indication is not accurate, two amber bars appear across the last two digits.
- When the gross weight is not computed on ground, blue dashes appear.
- Units may either be in KG or LB, depending on the DMC pin program.

Ident.: DSC-28-20-F-00020112.0001001 / 17 MAR 17

CENTER OF GRAVITY (CG) INDICATION

- It is normally green.
- When the FMGEC (FE part) detects an excess aft CG, it comes on red.
- When the CG is not computed on ground, blue dashes appear.

Ident.: DSC-28-20-F-00020113.0001001 / 17 MAR 17

FUEL TEMPERATURE INDICATION

- It is normally green.
- It is amber in the following cases:
  - Inner tanks: Above 49 °C in flight, or 45 °C on ground.
  - Outer or trim tanks: Below -40 °C.
  - Inner tanks: Below -37 °C.
- It disappears, when the tank quantity is below:
  - 1 000 kg (2 200 lb) for the trim tank.
  - 1 100 kg (2 420 lb) for the outer tank.

Note: *Fuel temperature is not indicated for the right outer tank.*

Ident.: DSC-28-20-F-00020114.0001001 / 17 MAR 17

ENGINE (ENG) NUMBER

- It is white, when the ENG is running.
- It is amber, when the ENG is not running.

Ident.: DSC-28-20-F-00020115.0003001 / 17 MAR 17

F. FLOW 1+2 INDICATION

- It is in green.
- It is displayed using ECU or EEC indications.
- Units may either be in KG/MIN or LB/MIN, depending on the DMC pin program.

TRIM TK XFR : This memo appears in green during trim tank transfer.

ERRONEOUS AFT XFR FAULT TRIGGERING DURING REFUELLING

Ident.: DSC-28-100-00025739.0001001 / 10 MAY 22
Applicable to: LV-FVH, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KHT

DESCRIPTION

The FUEL AFT XFR FAULT alert may spuriously trigger during the refuelling when the fuel pumps are ON.

OPERATIONAL RECOMMENDATION

At the end of the refuelling, when the refuel mode is selected OFF, the ECAM alert should clear by itself.
If the alert is still displayed, set all the fuel pumps to OFF then ON again to clear the ECAM alert.
If the alert does not clear, it has to be considered as a real alert and reported in the logbook.

GENERAL

Ident.: DSC-29-10-10-00000265.0001001 / 21 MAR 16
Applicable to: ALL

The aircraft has three, independent, continuously-operating hydraulic systems : GREEN, BLUE, and YELLOW. Each system is supplied from its own hydraulic reservoir. Normal system operating pressure is 3 000 PSI (2 500 PSI for RAT). There is no possibility to transfer hydraulic fluid from one system to another.
The system is monitored by a Hydraulic System Monitoring Unit (HSMU).

Intentionally left blank

GREEN SYSTEM PUMPS

Ident.: DSC-29-10-20-00000266.0003001 / 21 MAR 16
Applicable to: ALL

Two pumps, respectively driven by each engine pressurize the green system.
In addition, an electric pump which can be manually or automatically controlled can also pressurize the green system.
If one engine fails, the electric pump runs automatically in flight, for 25 s, when the landing gear lever is selected up (to ensure gear retraction in a proper time).
A pump, driven by a Ram Air Turbine (RAT), pressurizes the green system in the event of an emergency.
When the RAT pressurizes the green system, the aileron, elevator, and spoiler servo control operating speeds are reduced.

BLUE SYSTEM PUMPS

Ident.: DSC-29-10-20-00000272.0003001 / 21 MAR 16
Applicable to: ALL

A pump, driven by Engine 1, pressurizes the blue system.
A manually-controlled electric pump can also pressurize the system.
In the event of an Engine 1 failure, in addition to a PRIM 1 or PRIM 3 loss : The BLUE ELEC PUMP runs automatically in flight to ensure sufficient authority on the electrical rudder, thereby counteracting the yaw sideslip induced by asymetrical thrust.

YELLOW SYSTEM PUMPS

Ident.: DSC-29-10-20-00000277.0002001 / 21 MAR 16
Applicable to: ALL

A pump, driven by Engine 2 pressurizes the yellow system.
In addition, an electric pump which can be manually or automatically controlled can also pressurize the yellow system. This enables ground operations, when the engines are stopped.

The electric pump runs automatically :
- in flight, in the event of Engine 2 failure, if the FLAPS lever is not at 0 (to ensure flap retraction in a proper time at takeoff).
- on the ground during cargo door operation.

Crewmembers can also use a hand pump to pressurize the yellow system, in order to operate the cargo doors when no electrical power is available.

Note: *On each system, the electric pump flow is about 18 % of the engine-driven pump flow capacity. It can be used to retract the surfaces, but should not be used to replace the engine-driven pumps.*

RAM AIR TURBINE (RAT)

Ident.: DSC-29-10-20-00000285.0003001 / 23 SEP 15
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

A drop-out RAT, coupled to a hydraulic pump, allows the green system to function.
The RAT may be extended at any time by pressing the RAT MAN ON pushbutton.
The RAT deploys automatically in the event of both engine failure or a low level in the green and yellow or green and blue reservoirs. It can be manually deployed from the overhead panel. It can only be stowed when the aircraft is on the ground.

SYSTEM ACCUMULATORS

Ident.: DSC-29-10-20-00000288.0001001 / 21 MAR 16
Applicable to: ALL

An accumulator in each system helps maintain constant pressure by covering transient demands during normal operation.

FIRE SHUTOFF VALVES

Ident.: DSC-29-10-20-00000293.0005001 / 21 MAR 16
Applicable to: ALL

A fire shutoff valve is positioned upstream of each engine driven pump. The flight crew can close the valve by pushing the FIRE pushbutton.
Both engine green hydraulic fire shut-off valves are automatically closed by the HSMU, in the event of a green reservoir low level. If the blue and yellow reservoir levels are normal, 150 s after the initial closure of the fire shut-off valves, the green engine-driven pumps are automatically depressurized and the fire shut-off valves are reopened to lubricate and avoid damage to the engine-driven pumps.

In case of a further blue or yellow reservoir low level, the green fire shut-off valves remain closed, enabling the green system to be restored by using the RAT. The flight crew cannot re-open the fire shut-off valves in flight, once they have been automatically closed.

FILTERS

Ident.: DSC-29-10-20-00000295.0002001 / 21 MAR 16
Applicable to: ALL

L3 The hydraulic fluid is maintained clean by filters:
- Two HP filters on green system
- One HP filter on blue system and one on yellow system
- One on the reservoir filling system
- One on the braking system
- One return line filter on each system (LP filters)
- One case drain filter on engine pump permits the monitoring of wear by detection of metallic particles in the filters.

HYDRAULIC SYSTEM MONITORING UNIT (HSMU)

Ident.: DSC-29-10-20-00000296.0002001 / 21 MAR 16
Applicable to: ALL

The HSMU monitors the hydraulic system.

It processes :
- Control of electric pumps
- RAT extension
- Both engine green hydraulic fire shutoff valve closure in case of green reservoir low level
- Hydraulic quantity indication correction for fluid temperature
- Reservoir overheat warning
- FAULT light illumination logic
- LEAK MEASUREMENT VALVE control (closure inhibited in flight, closure of yellow valve during cargo door operation).

HYDRAULIC GENERATION

RESERVOIR PRESSURIZATION

Ident.: DSC-29-10-20-00000300.0002001 / 04 MAR 13
Applicable to: ALL

Normally, HP bleed air from engine 1 pressurizes the hydraulic reservoirs automatically. If the bleed air pressure is too low, the system takes bleed air pressure from the crossbleed duct.
The system maintains a high enough pressure to prevent their pumps from cavitating.

LEAK MEASUREMENT VALVES

Ident.: DSC-29-10-30-00000306.0001001 / 21 MAR 16
Applicable to: ALL

Used only on ground.
Leak measurement valves are positioned upstream of the primary flight controls. They are used for the leak measurement of each system and may only be closed on ground, by using the LEAK MEASUREMENT VALVES pushbutton on the maintenance panel. The yellow valve is automatically closed during cargo door operation.
The HSMU inhibits the closure of the green, blue and yellow hydraulic leak measurement valves in flight.

PRIORITY FUNCTION

Ident.: DSC-29-10-30-00000308.0001001 / 22 MAR 16
Applicable to: ALL

In the event of low hydraulic pressure, a priority valve cuts off hydraulic power to heavy load users (emergency generator, nosewheel steering, landing gear) in order to keep the pressure for normal braking and flight controls.
A Pressure-Off Brake system (installed on the flaps, slats, and THS actuator) ensures the same function.

(1) ENG 1 (or 2) PUMP pb sw (guarded)

On	:	The pump pressurizes the system, when the engine is running.
OFF	:	The pump is depressurized. Hydraulic power generation stops.
FAULT light	:	This amber light and an associated ECAM caution come on, if: - The reservoir level is low - The reservoir overheats - Reservoir air pressure in the reservoir is low - The pump pressure is low (inhibited on ground, when the engine is stopped). This light goes off, when the crew selects OFF, except during an overheat. (The light stays on, for as long as the overheat lasts).

(2) GREEN (or YELLOW) ELEC PUMP pb

AUTO : The HSMU automatically controls the pump:
- The green electric pump runs:
  - For 25 s, in the event of a one-engine failure, when the landing selector lever is selected up and the aircraft speed is above 100 kt.
- The yellow electric pump runs:
  - In the event of an Engine 2 failure, if the FLAPS lever is not at zero and the aircraft speed is above 100 kt, provided the green electric pump is not running for landing gear retraction. It remains running until the last engine shutdown.
  - On ground, when the lever of the cargo door manual selector valve is set to the OPEN or CLOSE position. In this case, the yellow leak measurement valve closes, and yellow flap motor operation is inhibited.

OFF : The pump is off.

FAULT light : This amber light, and an associated ECAM caution come on, if:
- The reservoir level is low, or
- The reservoir overheats, or
- Air pressure in the reservoir is low, or
- The pump delivers low pressure (inhibited when the pump is not controlled on), or
- The pump overheats.

The light goes off when the crew selects OFF, except during an overheat. In the case of a reservoir or an electrical pump overheat, the fault light stays on, until the overheat stops.

Note: *If the yellow/green electric pump overheats, the pump automatically shuts down.*

(3) GREEN (or YELLOW) ELEC PUMP ON pb (springloaded-guarded)

AUTO : The electric pump is controlled by the applicable ELEC PUMP pb's.

ON : The electric pump is on, provided the ELEC PUMP pb's is not selected OFF. After an electrical power interruption, the pump does not restart (ON light stays off).
The ON light comes on blue, when the pump is manually or automatically supplied.

(4) BLUE ELEC PUMP pb

Standby : The HSMU automatically controls the electric pump, in the event of an engine 1 failure in addition to a PRIM 1 or 3 loss.

OFF : The pump is off.

FAULT light : The amber fault light comes on (provided the blue electrical pump is running), along with an associated ECAM caution, if:
- The reservoir level is low, or
- Air pressure in the reservoir or pump pressure is low, or
- The reservoir or the pump overheat.

The light goes off when the crew selects OFF, except during an overheat. In the case of a reservoir or an electrical pump overheat, the fault light stays on, until the overheat stops.

Note: If the blue electric pump overheats, the pump automatically shuts down.

(5) BLUE ELEC PUMP ON pb (springloaded-guarded)

ON : The electric pump is on, provided the ELEC PUMP pb is not selected OFF. If the electrical power supply is removed, the pump remains off when electrical power is applied again.

STBY : The electric pump is controlled by the applicable ELEC PUMP pb’s.

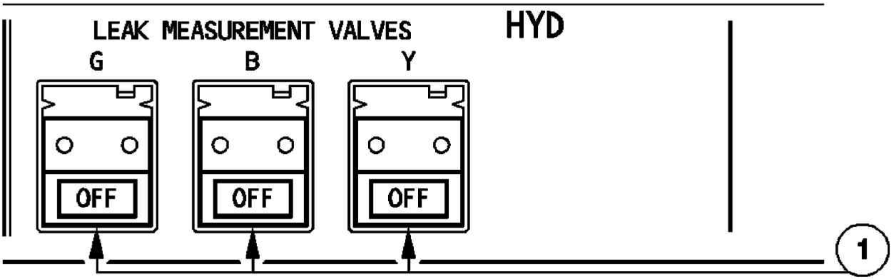
(6) RAT MAN ON pb

The RAT may be extended at any time by pressing the RAT MAN ON pb.

Note: The RAT automatically extends in flight, if:
Both engines fail, or GREEN + BLUE LO LVL, or GREEN + YELLOW LO LVL.

OVERHEAD PANEL (CONT'D)

Ident.: DSC-29-20-00000333.0002001 / 21 MAR 16
Applicable to: ALL



(1) LEAK MEASUREMENT VALVES pushbutton (guarded) (to be used on ground only)

OFF : The corresponding electrohydraulic valve closes, and shuts off hydraulic supply to the primary flight controls. This function is inhibited, when the aircraft speed is greater than 100 kt.

Note: 1. *Even if the function is inhibited in flight : If the flight crew inadvertently presses this pushbutton, the OFF light will still come on to advise the crew that the electrohydraulic valves will close at landing, when the aircraft speed is less than 100 kt.*
2. *On ground, the yellow valve automatically closes, when the cargo door is activated (to avoid inadvertent movement of the flight control surfaces).*
The OFF light comes on.

Visual Ice Indicator ..... A
Ice Detection System ..... B

GENERAL

Ident.: DSC-30-10-10-00000368.0001001 / 21 MAR 16
Applicable to: ALL

The ice and rain protection system allows unrestricted operation of the aircraft in icing conditions and heavy rain.

ANTI-ICE

Ident.: DSC-30-10-10-00000372.0003001 / 30 MAR 12
Applicable to: ALL

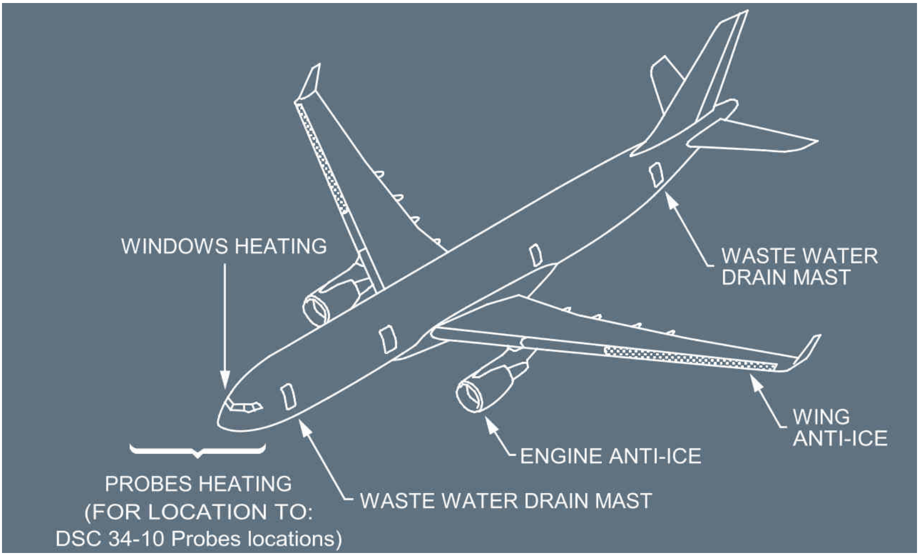
Either hot air or electrical heating protects critical areas of the aircraft as follows:

HOT AIR

- Four outboard leading-edge slats of each wing
- Engine air intakes.

ELECTRICAL HEATING

- Flight compartment windows
- Sensors, pitot probes, static ports, TAT probes and angle-of-attack probes
- Waste water drain mast.



WINDOWS HEATING
WASTE WATER DRAIN MAST

(FOR LOCATION TO:
DSC 34-10 Probes locations)

RAIN REMOVAL

Ident.: DSC-30-10-10-00017819.0001001 / 21 MAR 16
Applicable to: ALL

Wipers and fluid rain repellent ◁ , remove rain from the front windshield panels.

DESCRIPTION

Ident.: DSC-30-20-10-00017822.0005001 / 21 MAR 16
Applicable to: ALL

Hot air from the pneumatic system heats the four outboard slats (4-5-6-7) of each wing in flight.
The WING pushbutton on the ANTI ICE panel controls the four valves.
When the aircraft is on ground, the flight crew can initiate a 30 s test sequence by turning the system ON.
If the system detects a leak during normal operation, the affected side's wing anti-ice valve automatically closes (*Refer to DSC-36-10-60 Leak Detection*).
When wing anti-ice is selected, the N1 or EPR limit is automatically reduced, and the idle N1 or EPR is automatically increased.
In the event of electrical power supply failure, the valves close.

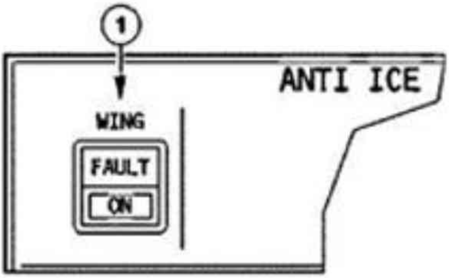
Applicable to: ALL



(1) WING ANTI ICE pushbutton

This pushbutton simultaneously controls the wing anti-ice system on the left and right sides.

Off : The ON light goes off.
The wing anti-ice control valves close.

FAULT lt : Light comes on amber, and a caution appears on the ECAM, if :
- The position of the anti-ice control valve is not the required position, or
- Low pressure is detected.

Note: *The amber FAULT light comes on briefly during pressure built up, or when the valves open.*

ON : Light comes on blue.
The WING A.ICE indication appears on the ECAM MEMO page.
Wing anti-ice control valves open, if pneumatic supply is available.
On the ground, the wing anti-ice control valves open for only 30 s (test sequence).

ECAM BLEED PAGE

Ident.: DSC-30-20-20-00000414.0001001 / 21 MAR 16
Applicable to: ALL

(*Refer to DSC-36-20 BLEED SD Page*).

MEMO DISPLAY

Applicable to: ALL

Ident.: DSC-30-20-20-A-00017118.0003001 / 21 MAR 16

ICE NOT DET : This memo appears in green if ice is not detected for 130 s after the flight crew has set the WING ANTI ICE pb-sw to ON.

Ident.: DSC-30-20-20-A-00017117.0001001 / 21 MAR 16

WING A.ICE : This memo appears in green if the WING ANTI ICE pb-sw is ON.

DESCRIPTION

Ident.: DSC-30-30-10-00017827.0001001 / 21 MAR 16
Applicable to: ALL

An independent air bleed from the high pressure compressor protects each engine nacelle from ice.
The air is supplied through a two-position (open and closed) valve that the flight crew controls with pushbuttons : One for each engine.
The valve closes automatically if air is not available (engine not running).
When an engine anti-ice valve is open, the N1 or EPR limit for that engine is automatically reduced, and the idle N1 or EPR is automatically increased.
If electric power fails, the valves open.

Ident.: DSC-30-30-20-A-00017120.0002001 / 21 MAR 16

ICE NOT DET : This memo appears in green if ice is not detected for 130 s after the flight crew has set the ENG ANTI ICE pb-sw to ON.

DESCRIPTION

Ident.: DSC-30-40-10-00017831.0001001 / 15 NOV 22
Applicable to: ALL

The aircraft uses electrical heating to anti-ice each windshield and defog the cockpit side windows. Two independent WHC, one on each side, automatically regulates the system, protects it against overheating, and indicates faults.

Window heating comes ON:
- Automatically when at least one engine is running, or when the aircraft is in flight
- Manually before engine start, when the flight crew switches ON the PROBE/WINDOW HEAT pb-sw.

The windshield heating operates at low power on ground and at normal power in flight.
Only one heating level exists for the windows.

Intentionally left blank

OVERHEAD PANEL

Ident.: DSC-30-40-20-00000461.0001001 / 21 MAR 16
Applicable to: ALL

(*Refer to DSC-30-50-20 Overhead Panel*)

Intentionally left blank

DESCRIPTION

Ident.: DSC-30-50-10-00017832.0001001 / 21 MAR 16
Applicable to: ALL

Electrical heating protects :
- Pitot probes
- Static ports
- Angle-Of-Attack (AOA) probes
- Total Air Temperature (TAT) probes.

Three independent Probe Heat Computers (PHC) automatically control and monitor :
- Captain probes
- F/O probes
- STBY probes.

They protect against overheating and indicate fault.

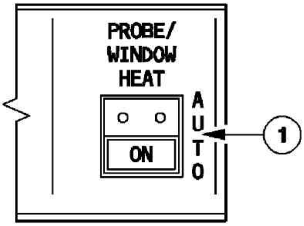
The probes are heated :
- automatically when at least one engine is running, or in flight
- manually, when the flight crew switches ON the PROBE/WINDOW HEAT pushbutton switch.

On the ground, the TAT probes are not heated and pitot heating operates at low level (the changeover to normal power in flight is automatic).

Intentionally left blank

OVERHEAD PANEL

Ident.: DSC-30-50-20-00017838.0001001 / 15 NOV 22
Applicable to: ALL



(1) PROBES/WINDOW HEAT pushbutton

AUTO	Probes/windows are automatically heated: - In flight, or - On ground (except TAT probes), provided one engine is running.
ON	The blue light indicates that the probes and windows are heated (except TAT probes on ground).

Note: *Ensure that the probe covers are removed before setting the PROBE/WINDOW HEAT pb-sw to ON.*

Intentionally left blank

DESCRIPTION

Ident.: DSC-30-55-10-00000525.0001001 / 21 MAR 16
Applicable to: ALL

An ice protection system is installed to prevent ice formation in the waste disposal system and the potable water system. Electrical heating elements in form of flexible tapes are attached to the waste/potable water lines which are installed in areas of possible icing conditions (in the vicinity of fuselage skin). Temperature sensors are installed to detect icing conditions. The fill/drain nipples on the water service/waste panel and the two drain masts are heated. The two Water Ice-Protection Control Units (WIPCU) installed operate independently : one controls the forward section of the ice protection system, the second one the aft section.

Intentionally left blank

SYSTEM OPERATION

Ident.: DSC-30-55-20-00000529.0001001 / 21 MAR 16
Applicable to: ALL

The temperature sensors measure permanently the water line temperature. In the WIPCU, the measured value is compared with a reference temperature for the related location. This threshold can be set individually for each area by maintenance action. If the temperature drops below the reference value the heating elements for the related area are turned on. A different (higher) threshold is used to turn the heating elements off.

Intentionally left blank

WIPERS

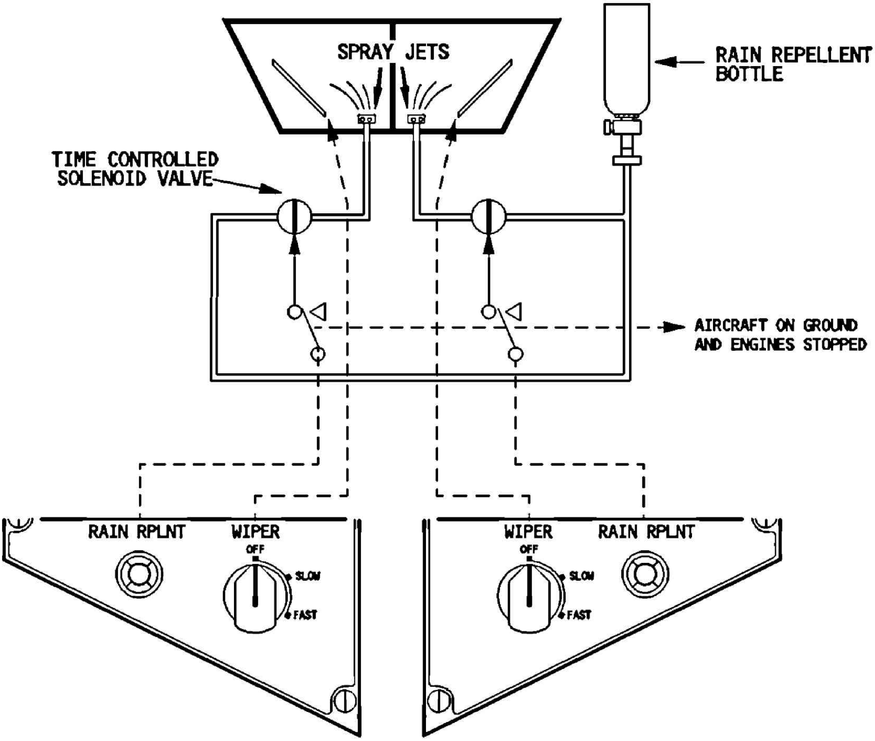
Ident.: DSC-30-60-10-00017842.0001001 / 21 MAR 16
Applicable to: ALL

Each front windshield has a two-speed electric wiper.
Each crewmember can control the speed of the wipers via a rotary selector.

RAIN REPELLENT SYSTEM

Ident.: DSC-30-60-10-00017950.0001001 / 21 MAR 16
Applicable to: ALL

In moderate to heavy rain, the flight crew can spray a rain repellent liquid on the windshield to improve visibility.
The window is covered by spray after about 30 s.
Separate pushbuttons control the rain repellent application on each side of the windshield.



SPRAY JETS

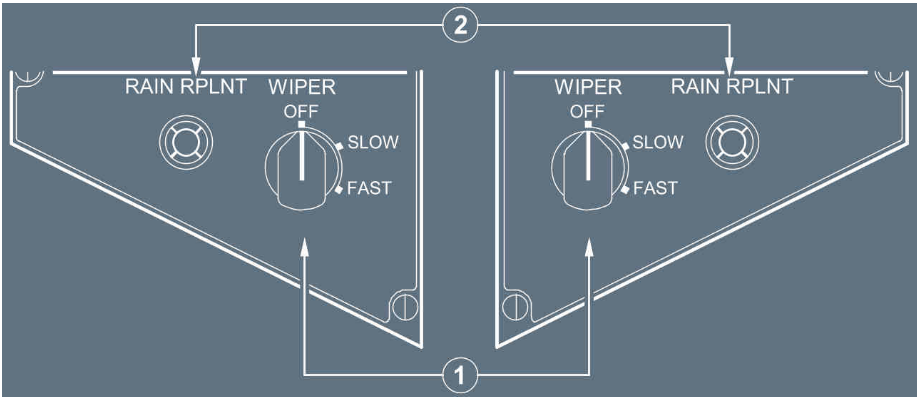
OVERHEAD PANEL

Ident.: DSC-30-60-20-00000535.0001001 / 09 OCT 12
Applicable to: ALL

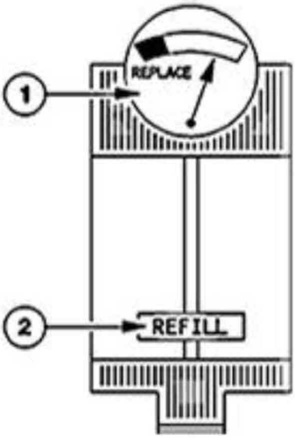


(1) WIPER sel
Each rotary selector controls its wiper at either low or high speed. When turned off the wiper stops out of view.

(2) RAIN RPLNT pb
Each of these button controls the application of rain repellent fluid to one side of the front windshield.
When the flight crew pushes the button, the timer applies a measured quantity of rain repellent to the windshield. To repeat the cycle the flight crew must push the button again.
This function is inhibited when the aircraft is on the ground, engines stopped.

RAIN REPELLENT SYSTEM INDICATORS ⩤

Ident.: DSC-30-60-20-00017979.0001001 / 21 MAR 16
Applicable to: ALL



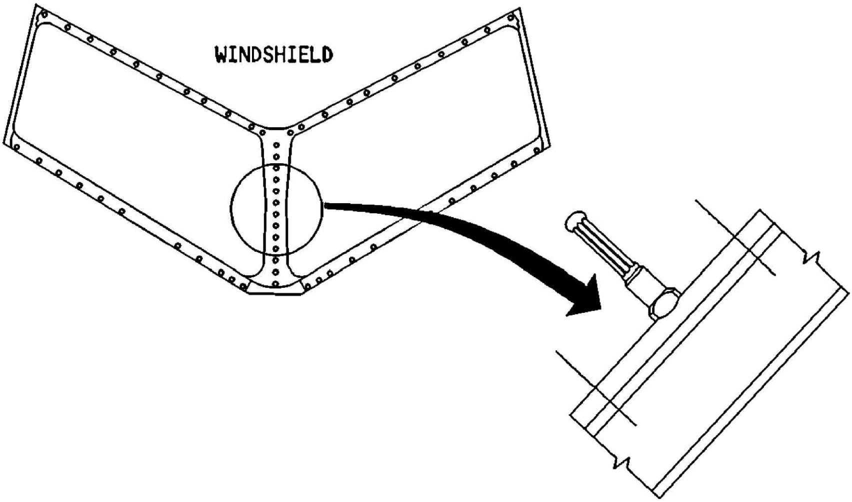
(1) Rain Repellent pressure indicator
This shows the nitrogen pressure and therefore the remaining fluid in the rain repellent bottle. When the needle is in the yellow sector the bottle should be replaced.

(2) Rain Repellent low level indicator (depending on aircraft configuration)
When REFILL float is in view, the bottle should be replaced.

VISUAL ICE INDICATOR

Ident.: DSC-30-70-10-00017846.0001001 / 21 MAR 16
Applicable to: ALL

An external visual ice indicator, which is visible to the crew, is installed between the two windshields. The indicator also has an external light ◁❄ .



ICE DETECTION SYSTEM

Ident.: DSC-30-70-10-00017849.0001001 / 21 MAR 16
Applicable to: ALL

The ice detection system has two separate ice detector probes on the forward lower section of the fuselage.
The system operates automatically and starts at electrical power up.
The probes detect ice accretion. They also indicate, through the MEMO display, that icing conditions have disappeared. The system logic generates ECAM messages according to ice detector signals and the flight crew's selection of engine or wing anti-ice systems.
The ice detection system does not control the ENG or WING anti-ice systems.

INTRODUCTION

Ident.: DSC-31-05-10-00000367.0001001 / 22 MAR 16
Applicable to: ALL

The electronic instrument system (EIS) presents data on six identical display units (DUs):

- The electronic flight instrument system (EFIS) displays mostly flight parameters and navigation data on the primary flight displays (PFDs) and navigation displays (NDs)
- The electronic centralized aircraft monitor (ECAM) presents data on the engine/warning display (E/WD) and system display (SD) :
  - Primary engine indications, fuel quantity, flap and slat position
  - Warning and caution alerts or memos
  - Synoptic diagrams of aircraft systems, and status messages
  - Permanent flight data

DISPLAY UNIT(DU)

Ident.: DSC-31-05-30-00000377.0002001 / 21 MAR 16
Applicable to: ALL

The instrument panels have six identical units.
These DUs are full-color Liquid Crystal Displays (LCD).

DISPLAY MANAGEMENT COMPUTER (DMC)

Ident.: DSC-31-05-30-00000379.0002001 / 21 MAR 16
Applicable to: ALL

Three identical Display Management Computers (DMCs) obtain data from the different sensors and computers, and send it to the display units. The display units then generate and display the applicable images. Each DMC has a single DMC channel, and can simultaneously supply one PFD, one ND, and both ECAM display units (E/WD and SD).

SYSTEM DATA ACQUISITION CONCENTRATOR (SDAC)

Ident.: DSC-31-05-30-00000383.0001001 / 22 MAR 16
Applicable to: ALL

The two identical SDACs acquire data, then generate signals. Some of these signals go to the three DMCs, which use them to generate displays of system pages and engines parameters. Others go to the flight warning computers which use them to generate ECAM messages and aural alerts.

FLIGHT WARNING COMPUTER (FWC)

Ident.: DSC-31-05-30-00000387.0001001 / 21 MAR 16
Applicable to: ALL

The two identical FWCs generate alert messages, memos, aural alerts, and synthetic voice messages. For this purpose they acquire data:
- directly from aircraft sensors or systems to generate red warnings
- through the SDACs to generate amber cautions.

The ECAM display units display the alert messages generated by the FWCs.

The FWCs also generate:
- radio height callouts
- decision height callouts
- landing speed increments.

ATTENTION-GETTERS

Ident.: DSC-31-05-30-00000391.0001001 / 21 MAR 16
Applicable to: ALL

The FWCs also drive the attention-getters. Each pilot has a set of these on the panel under the glareshield. They are :

- a master warning light that flashes “MASTER WARN” in red for red warnings
- a master caution light that illuminates “MASTER CAUT” in amber for amber cautions.

LOUDSPEAKER

Ident.: DSC-31-05-30-00000393.0001001 / 21 MAR 16
Applicable to: ALL

The communications loudspeakers announce aural alerts and voice messages, and do so even when they are turned off.

ECAM CONTROL PANEL (ECP)

Ident.: DSC-31-05-40-00000400.0001001 / 21 MAR 16
Applicable to: ALL

This panel allows the pilot to have the ECAM display units display either warning and caution messages or system and system status images.

ECAM DMC SWITCHING

Ident.: DSC-31-05-40-00000402.0001001 / 21 MAR 16
Applicable to: ALL

A switch on the ECAM SWITCHING panel which is on the main instrument panel allows the flight crew to replace the DMC 3 with DMC 1 or DMC 2.

ECAM/ND SWITCHING

Ident.: DSC-31-05-40-00000405.0001001 / 21 MAR 16
Applicable to: ALL

A switch on the ECAM SWITCHING panel allows the flight crew to transfer the ECAM system display to either the captain's or the first officer's navigation display.

PFD/ND SWITCHING

Ident.: DSC-31-05-40-00000406.0001001 / 21 MAR 16
Applicable to: ALL

A PFD/ND XFR pushbutton on each side console allows the pilot to swap displays on respective onside DUs.

EFIS DMC SWITCHING

Ident.: DSC-31-05-40-00000408.0001001 / 21 MAR 16
Applicable to: ALL

A switch on each side console allows the pilot to manually select the DMC 3 or the opposite DMC for supply of data to the onside PFD/ND.

Intentionally left blank

RECONFIGURING THE DISPLAY MANAGEMENT COMPUTER (DMC)

Ident.: DSC-31-05-50-00000409.0002001 / 21 MAR 16
Applicable to: ALL

In normal operation :
- DMC 1 supplies data to the Captain's PFD and ND.
- DMC 2 supplies data to the First Officer's PFD and ND.
- DMC 3 supplies data to the upper and lower ECAM DU.

If a DMC fails, the corresponding DU displays the INVALID DATA message. The flight crew can replace DMC 1 or 2 with DMC 3 by turning the EFIS DMC selector, on the EFIS DMC panel, to 3.
In case of DMC 3 failure, DMC 1 automatically takes over and supplies the ECAM DUs, provided the ECAM SWITCHING selector is in the AUTO position.

Intentionally left blank

FAILURE OF UPPER ECAM DU (OR CTL/BRIGHTNESS KNOB TURNED TO OFF)

Ident.: DSC-31-05-60-00000411.0001001 / 21 MAR 16
Applicable to: ALL

If the upper ECAM display fails, or is switched off :
- The engine/warning page automatically replaces the system/status page on the lower ECAM DU.

The flight crew can display the system/status page by :
- Using the “ECAM/ND XFR” switch, on the ECAM SWITCHING panel, to move it to a navigation display unit (NDU), or
- Pushing and holding (for a maximum of 3 min) the related system page pushbutton, on the ECAM control panel, to temporarily display it on the lower ECAM DU (instead of the engine/warning page).

FAILURE OF LOWER ECAM DU (OR CTL/BRIGHTNESS KNOB TURNED TO OFF)

Ident.: DSC-31-05-60-00000415.0001001 / 21 MAR 16
Applicable to: ALL

If the lower ECAM display fails, or is switched off, the flight crew can display the system/status page by :
- Using the “ECAM/ND XFR” switch, on the ECAM SWITCHING panel, to display it on the NDU, or
- Pushing and holding (for a maximum of 3 min) the related system page pushbutton on the ECAM control panel, to temporarily display it on the upper ECAM DU (instead of the engine/warning page).

FAILURE OF BOTH ECAM DUS

Ident.: DSC-31-05-60-00000418.0001001 / 21 MAR 16
Applicable to: ALL

If both ECAM displays fail, the flight crew may :
- Use the “ECAM/ND XFR”, on the ECAM SWITCHING panel, to display the engine/warning page on a navigation display and, if needed,
- Push and hold (for a maximum of 3 min) the related system page pushbutton, on the ECAM control panel, to temporarily display the system/status page on an ND.

PFD/NDU RECONFIGURATION

Ident.: DSC-31-05-60-00000423.0001001 / 21 MAR 16
Applicable to: ALL

If a PFDU fails, the system automatically transfers the PFD to the NDU.

The pilot can also make this transfer manually by :
- turning the PFD ON-OFF/brightness control OFF, or
- pressing the PFD/ND/XFR pushbutton, which cross-changes the images between the PFDU and the NDU.

If an NDU fails, the pilot can use the PFD/ND/XFR pushbutton to transfer the ND image to the PFDU.

MESSAGES ON THE DISPLAY UNIT (DUS)

Applicable to: ALL

Ident.: DSC-31-05-60-A-00012970.0001001 / 14 FEB 11

These messages are displayed on either the EFIS or the ECAM Display Unit (DU) depending on the current EFIS or ECAM configuration.

Ident.: DSC-31-05-60-A-00012972.0001001 / 14 AUG 12

FAILURE OF A DU

If a DU fails, the flight crew may find one of the following displays:

- A blank screen with a “F” letter in amber, or
- A distorted display, or
- A blank screen with the “INVALID DISPLAY UNIT” message in amber.

Ident.: DSC-31-05-60-A-00012974.0001001 / 14 FEB 11

FEEDBACK MESSAGES

The DU displays the following messages in amber when the Display Management Computer (DMC) detects a discrepancy between the parameters obtained by the DMC and the operational parameters displayed on the DU:

- ”CHECK CAPT PFD” (“CHECK F/O PFD”) if the discrepancy concerns the PFD parameters
- ”CHECK CAPT ND” (“CHECK F/O ND”) if the discrepancy concerns the ND parameters
- ”CHECK EWD” if the discrepancy concerns the E/WD parameters
- ”CHECK SD” if the discrepancy concerns the SD parameters.

In addition, if the aircraft is on ground, the “DU NOT MONITORED” message is displayed in amber when there is only one DMC, instead of two DMCs, that provides the affected DU with feedback information. This message means that there is either a DMC test in progress or that there is an EIS failure. In the case of an EIS failure, a maintenance action is necessary.

Ident.: DSC-31-05-60-A-00012975.0001001 / 04 NOV 21

The DU displays the following messages along with a caution on the ECAM E/WD.

CHECK ATT	Attitude data displayed on both PFDs differ by more than 5 ° in pitch and/or roll.

CHECK ALT	Altitude data displayed on both PFDs differ by: - More than 250 ft when the flight crew selects a QNH different from STD, or - More than 500 ft when the flight crew selects a QNH STD. *Note:* *The caution and the CHECK ALT message disappear, when the CAPT EFIS and the F/O EFIS barometer references disagree.*
CHECK HDG	Heading data displayed on both PFDs and NDs differ by more than 5 °. *Note:* - *The CHECK HDG message flashes for a few seconds on the NDs, and then remains steady.* - *If the flight crew selects the PLAN mode on the NDs, the message is not displayed.*

Ident.: DSC-31-05-60-A-00012977.0001001 / 14 FEB 11

DU RESET

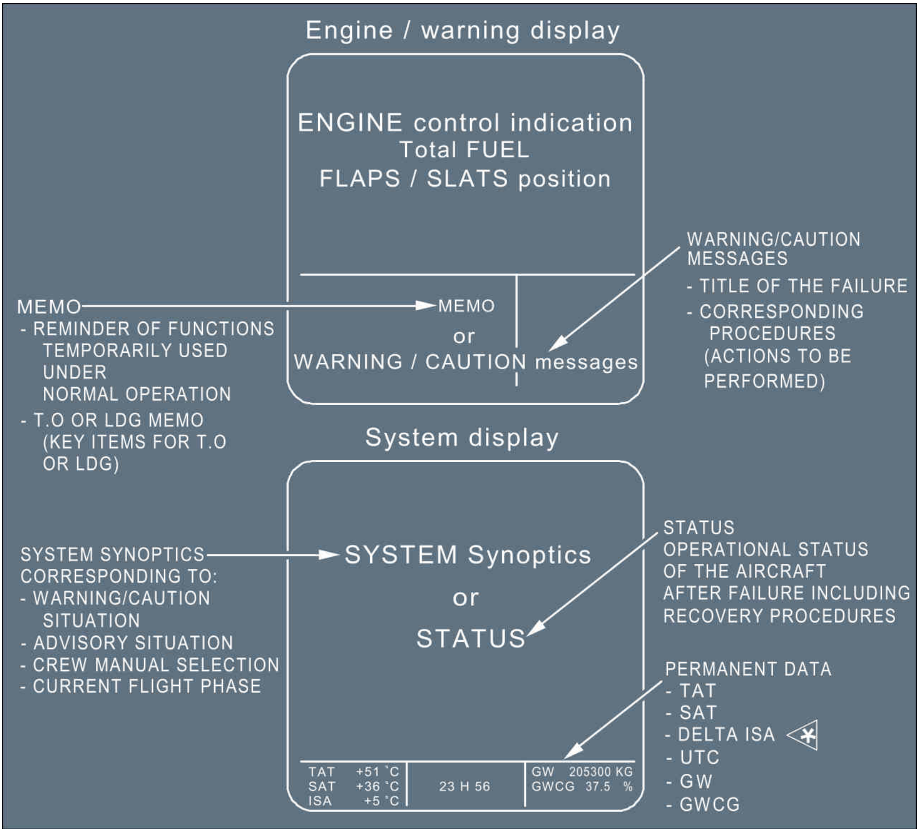
In the case of a DU reset, the message “SELF TEST IN PROGRESS” can be displayed in green and/or the message “WAITING FOR DATA” may be displayed in green during the EIS initialization.

Intentionally left blank

ECAM DU ARRANGEMENT

Ident.: DSC-31-10-00017660.0001001 / 21 MAR 16
Applicable to: ALL

The ECAM has two display units:
- One for the engine/warning display (E/WD).
- One for the system/status display (SD).



Engine / warning display
ENGINE control indication
Total FUEL
FLAPS / SLATS position
MEMO
or
WARNING / CAUTION messages
MEMO
- REMINDER OF FUNCTIONS TEMPORARILY USED UNDER NORMAL OPERATION
- T.O OR LDG MEMO (KEY ITEMS FOR T.O OR LDG)
WARNING/CAUTION MESSAGES

GWCG 37.5 %

COLOR CODE

Ident.: DSC-31-10-00000431.0001001 / 21 MAR 16
Applicable to: ALL

The ECAM display uses a color code that indicates the importance of the failure or the indication.

RED : The configuration or failure requires immediate action.
AMBER : The flight crew should be aware of the configuration or failure, but needs not take immediate action.
GREEN : The item is operating normally.
WHITE : These titles and remarks guide the flight crew as it executes various procedures.
BLUE : These are actions to be carried out, or limitations.
MAGENTA : These are particular messages that apply to particular pieces of equipment or situations (inhibition messages, for example).

WARNING/CAUTION CLASSIFICATION

Ident.: DSC-31-10-00000436.0001001 / 21 MAR 16
Applicable to: ALL

	LEVEL	SIGNIFICATION	AURAL	VISUAL
FAILURE MODE	Level 3	Red warning: The configuration or failure requires immediate action : - Aircraft in dangerous configuration or limit flight conditions (eg: stall, o/speed) - System failure altering flight safety (eg : Eng fire, excess cab alt)	Continuous Repetitive Chime (CRC) or specific sound or synthetic voice	- MASTER WARN light red flashing or specific red light - Warning message (red) on E/WD - Automatic call of the relevant system page on the S/D (1)

	Level 2	Amber caution:
		The flight crew should be aware of the configuration or failure, but does not need to take any immediate action. However, time and situation permitting, these cautions should be considered without delay to prevent any further degradation of the affected system :
		- System failure without any direct consequence on the flight safety (eg : HYD B SYS LO PR).
			Single Chime (SC)	- MASTER CAUT light, amber steady :
				  - Caution message (amber) on E/WD
				  - Automatic call of the relevant system page on the S/D (1).

	Level 1	Amber caution : Requires crew monitoring : - Failures leading to a loss of redundancy or system degradation (eg : FCDC fault)	NONE	- Caution message (amber) on E/WD, generally without procedure.

Continued on the following page

Continued from the previous page

	LEVEL	SIGNIFICATION	AURAL	VISUAL
INFORMATION	ADVISORY	System parameters' monitoring	NONE	- Automatic call of the relevant system page on the S/D. The affected parameter pulses green.
	MEMO	Information : Recalls normal or automatic selection of functions which are temporarily used.	NONE	- Green, Amber, or Magenta message on E/WD

(1) *except in some cases*

PRIORITY RULES

Ident.: DSC-31-10-00000445.0001001 / 17 MAR 17
Applicable to: ALL

There are three priority levels for warnings and cautions :
A level 3 warning has priority over a level 2 caution which has priority over a level 1 caution.
The FWC observes these priorities.

INFORMATION PROVIDED WHEN NEEDED

One of the main advantages of the ECAM is that it displays applicable information to the flight crew, on an "as needed" basis.

The following outlines the ECAM's operating modes:

- **Normal Mode**:
  Automatically displays systems and memos, in accordance with the flight phase.
- **Failure Mode**:
  Automatically displays the appropriate emergency/abnormal procedures, in addition to their associated system synoptic.
- **Advisory Mode**:
  Automatically displays the appropriate system synoptic, associated with a drifting parameter.
- **Manual Mode**:
  Enables the flight crew to manually select any system synoptic via the ECAM Control Panel (ECP).

Most warnings and cautions are inhibited during critical phases of flight (T/O INHIBIT – LDG INHIBIT), because most system failures will not affect the aircraft's ability to continue a takeoff or landing.

TYPES OF FAILURES

Ident.: DSC-31-10-00000447.0001001 / 09 MAY 17
Applicable to: ALL

Independent :	a failure that affects an isolated system or item of equipment without degrading the performance of others in the aircraft.
Primary :	a failure of a system or an item of equipment that costs the aircraft the use of other systems or items of equipment.
Secondary :	the loss of a system or an item of equipment resulting from a primary failure.

GENERAL

Ident.: DSC-31-15-00000467.0008001 / 21 MAR 17
Applicable to: LV-FVH, LV-FVI, LV-GHQ, LV-GIF, LV-GKO, LV-GKP, LV-KAN, LV-KAO

The Engine Warning Display (E/WD) appears on the upper ECAM Display Unit (DU).

- The upper part of this DU displays:
  - Engine parameters (Controls and Indicators)
  - Feedback messages (*Refer to DSC-31-05-60 Messages on the Display Units (DUs) - Feedback Messages*)
  - Fuel on board (FOB) (*Refer to DSC-28-20 ECAM Upper Display*)
  - Position of slats and flaps (*Refer to DSC-27-20-30 ECAM F/CTL Page*)
- The lower part of this DU displays messages generated by the FWC:
  - Warning and caution messages when a failure occurs,
  - Memos when there is no failure.

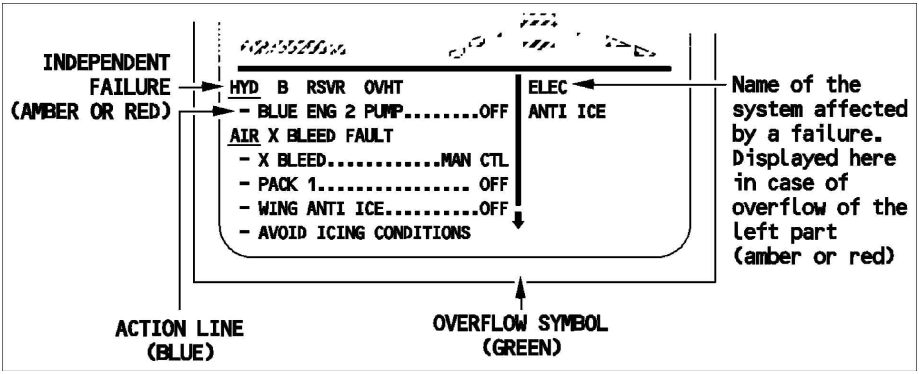
INDEPENDENT FAILURE

Ident.: DSC-31-15-00000471.0001001 / 21 MAR 16
Applicable to: ALL

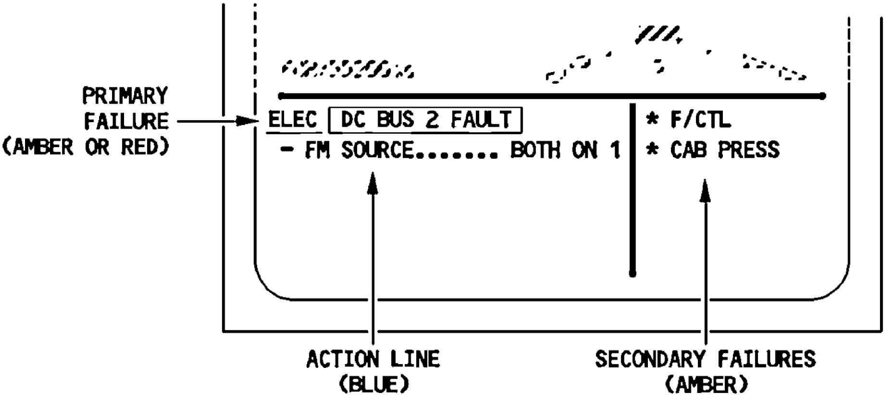


INDEPENDENT FAILURE (AMBER OR RED)
HYD B RSVR OVHT
- BLUE ENG 2 PUMP........OFF
AIR X BLEED FAULT
- X BLEED...........MAN CTL
- PACK 1................ OFF
- WING ANTI ICE..........OFF
- AVOID ICING CONDITIONS
ELEC
ANTI ICE
Name of the system affected by a failure. Displayed here in case of overflow of the left part (amber or red)
ACTION LINE (BLUE)
OVERFLOW SYMBOL (GREEN)

If there are too many ECAM messages for the amount of space available in the lower part of the E/WD, a green arrow appears at the bottom of the display, pointing down to show that the information has overflowed off the screen. The pilot can scroll down to view additional messages by pushing the CLR pushbutton on the ECAM control panel (on the pedestal, just below the lower ECAM DU).

PRIMARY AND SECONDARY FAILURES

Ident.: DSC-31-15-00000474.0001001 / 21 MAR 16
Applicable to: ALL



PRIMARY
FAILURE
(AMBER OR RED)
ELEC
DC BUS 2 FAULT
- FM SOURCE....... BOTH ON 1
* F/CTL
* CAB PRESS
ACTION LINE
(BLUE)
SECONDARY FAILURES
(AMBER)

The ECAM DU displays a primary failure as a boxed title.
It identifies a secondary failure by putting a star in front of the title of the affected system.

Note: *The DU displays the overflow symbol, if primary or secondary failures overflow. In case of ECAM SINGLE DISPLAY, the secondary failures are inhibited.*

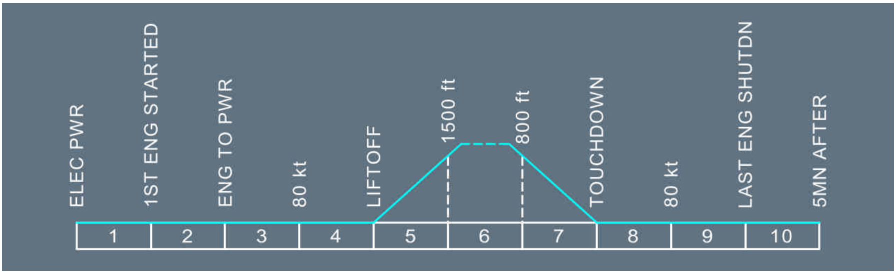
FLIGHT PHASES

Applicable to: ALL

Ident.: DSC-31-15-B-00000484.0001001 / 21 MAR 16

GENERAL

The FWC divides its functions according to these ten flight phases:



ELEC PWR
1ST ENG STARTED
ENG TO PWR
80 kt
LIFTOFF
1500 ft
800 ft
TOUCHDOWN
80 kt
LAST ENG SHUTDN
5MN AFTER
1
2
3
4
5
6
7
8
9
10

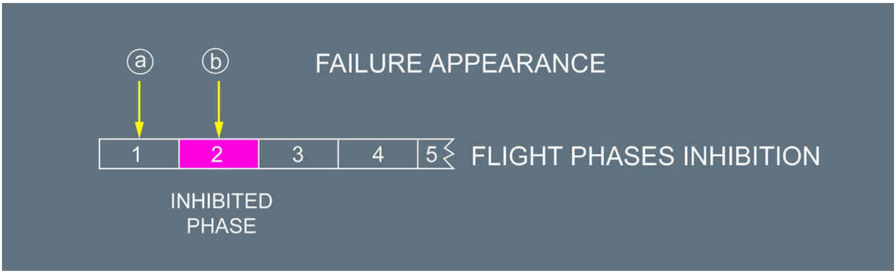
To improve its operational efficiency, the computer inhibits some warnings and cautions for certain flight phases. It does so to avoid unnecessarily alerting the pilots at times when they have high workloads (such as takeoff or landing). In these two phases, the DU displays magenta memos: “T.O. INHIBIT” (flight phases 3, 4, and 5), and “LDG INHIBIT” (flight phases 7 and 8).

Note: *These flight phases are different from, and independent of, the ones used by FMGEC.*

Ident.: DSC-31-15-B-00004743.0001001 / 21 MAR 16

FLIGHT PHASE INHIBITION

Two cases are possible (for instance) :



ⓐ
ⓑ
FAILURE APPEARANCE
1
2
3
4
5
FLIGHT PHASES INHIBITION
INHIBITED PHASE

Effect on E/WD :

(a) The failure occurs during Phase 1. The E/WD immediately displays the warning and continues to display it as long as the failure is present, even in Phase 2.

(b) The failure occurs during Phase 2. The E/WD only displays the warning once the aircraft has entered Phase 3, where it is not inhibited. Then, the warning remains displayed as long as the failure is present.

MEMO

Ident.: DSC-31-15-A-00000505.0001001 / 21 MAR 16
Applicable to: ALL

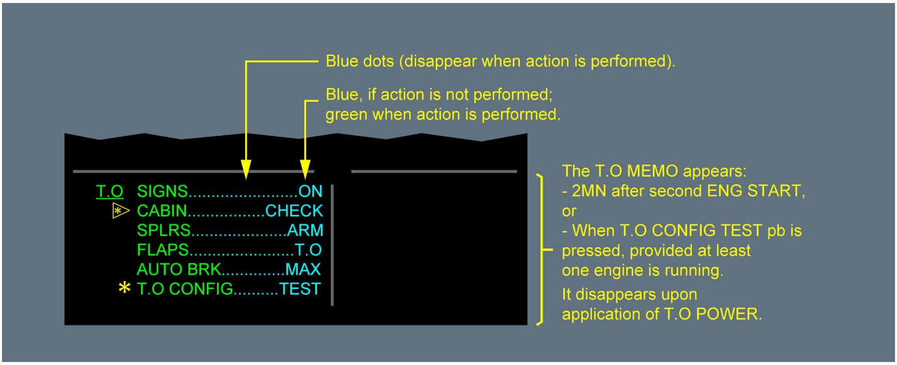
MEMO DISPLAY

Memos appear in the lower part of the E/WD.
They are normally in green. But, in abnormal situations, they may be amber.
Memos list functions or systems that are temporarily used in normal operations.

Ident.: DSC-31-15-A-00000523.0001001 / 04 JUN 19
Applicable to: LV-FVI, LV-KAN, LV-KAO, LV-KHU

T.O. AND LDG MEMOS

During the takeoff and landing phases, the right-hand side of the memo area displays specific T.O. INHIBIT or LDG INHIBIT memos.
Takeoff and landing memos are displayed, as follows, during the related flight phases :



T.O
SIGNS........................ON
CABIN.................CHECK
SPLRS.....................ARM
FLAPS.......................T.O
AUTO BRK..............MAX
* T.O CONFIG..........TEST

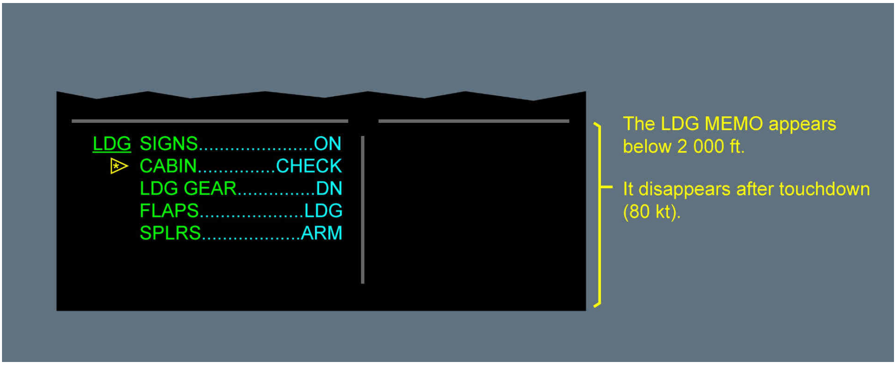
Blue dots (disappear when action is performed).

Blue, if action is not performed; green when action is performed.

The T.O MEMO appears:
- 2MN after second ENG START, or
- When T.O CONFIG TEST pb is pressed, provided at least one engine is running.

It disappears upon application of T.O POWER.

Note: ** This line disappears, when the test is completed. It is replaced by "T.O. CONFIG NORMAL", if the aircraft configuration is correct.*
The test is requested again, if the configuration becomes abnormal.



LDG SIGNS.....................ON
CABIN...............CHECK
LDG GEAR...............DN
FLAPS...................LDG
SPLRS..................ARM
The LDG MEMO appears below 2 000 ft.
It disappears after touchdown (80 kt).
